## It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

# Why buy an office automation system that doesn't offer a long-term solution?

## ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

### **IBM® and compatible hardware.**

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

### **Long-term support.**

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people

are always there to make sure your system fits your needs over the years to come.

### **Easy to operate.**

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

**Cover: The Senate Chamber, Maryland State House, Annapolis, Maryland.** In this chamber, the forty-seven senators from Maryland's forty-seven legislative districts meet every year for the ninety-day legislative session. The Senate Chamber, which has two visitors' galleries, is decorated in red and white, the Crossland colors on the Maryland Flag. The statue to the left of the desk at the front of the chamber is of John Hanson, a Marylander and the first President of The United States in Congress Assembled (i.e., the first President under the Articles of Confederation in 1781). The statue on the right is of Charles Carroll of Carrollton, one of Maryland's four signers of the Declaration of Independence.

# ***The Personality Disorder Treatment Program of Sheppard Pratt Hospital***

Very often, specialized inpatient evaluation and treatment is a critical step in the effective care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Short-term and intermediate-term specialized inpatient treatment
- ☐ Extended-term intensive inpatient treatment
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychotherapy and psychopharmacology consultation
- ☐ Intensive individual and group psychotherapy provided by our staff of psychiatrists and psychologists
- ☐ Long-term treatment planning

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

(301) 938-3800  
6501 North Charles Street  
Baltimore, Maryland 21285-5815

January, 1991

## Tuberculin Screening Procedure --Mantoux Method and Interpretation of Results

### Administering Skin Tests

1. Cleanse the upper half of the inner aspect of forearm thoroughly with an alcohol swab.
2. Dry completely.
3. Withdraw 0.1 ml from Purified Protein Derivative (PPD) vial containing 5 tuberculin units (5TU) in a disposable tuberculin syringe. (Keep PPD under refrigeration until ready for use.)
4. Select site at least two inches below antecubital crease. (On tiny infants, select site on mid forearm).
5. With a 26 gauge 1/2 inch needle, inject PPD intradermally so that a small wheal (6-10mm) forms directly over the needlepoint. (The injection should be made just beneath the surface of the skin into the dermis with the needle bevel upward.)
6. Remove any leakage with a pledget.
7. Record date of test in chart and give instructions to patient to return for reading of the test.
8. Do not recap needle, dispose of needle and syringe into an appropriate puncture-resistant container.

### Reading Skin Tests

1. Read test 48-72 hours after administration.
2. In good light, palpate for presence or absence of induration.
3. When induration is present, using a millimeter rule, measure the transverse diameter (transverse relative to the long axis of the arm). Measure only induration, not erythema. Record in chart the size of induration in millimeters, the name of antigen, and the date of reading.

### Centers for Disease Control Guidelines for Interpreting Skin Tests

**5 or more millimeters induration is considered positive for the highest risk groups, such as:**

- Persons with HIV infection;
- Persons who have had close contact with an infectious tuberculosis case;

- Persons who have chest radiographs consistent with old, healed tuberculosis and,
- Intravenous drug users whose HIV status is unknown.

**10 or more millimeters induration is considered positive for other high risk groups, such as:**

- Foreign-born persons from high prevalence areas (such as Asia, Africa, and Latin America);
- Intravenous drug users known to be HIV seronegative;
- Medically-underserved low income populations, including high-risk racial or ethnic minority populations (especially Blacks, Hispanics, and Native Americans);
- Residents of long-term care facilities (such as correctional institutions, nursing homes, mental institutions);
- Persons with medical conditions which have been reported to increase the risk of tuberculosis such as silicosis, being 10 percent or more below ideal body weight, chronic renal failure, diabetes mellitus, high dose corticosteroid and other immunosuppressive therapy, some hematologic disorders (such as leukemias and lymphomas), and other malignancies;
- Locally identified high risk populations;
- Children who are in one of the high risk groups listed above; and,
- Health care workers who provide services to any of the high risk groups.

**15 or more millimeters induration is considered positive for persons with no risk factors for tuberculosis.**

**Negative Reactions** - For each of the categories, reactions below the cut off point are considered negative.

## Transmission of Hepatitis B Virus Associated with a Spring-Loaded Fingertick Device

*The purpose of this notice is to inform health care workers of a potential risk of hepatitis B transmission associated with improper use of spring-loaded lancet devices to obtain capillary blood samples. The following report summarizes an article that appeared in the Morbidity and Mortality Weekly Report, September 7, 1990, p.610-2. This report and others underscore the importance of avoiding cross contamination when using these devices. Health care workers should ensure that this information is communicated to appropriate staff.*

In March 1990, staff in a hospital in California noted an increase in the number of patients diagnosed with acute hepatitis B (HB). From June 1989 through May 1990, 20 patients with HB were identified compared to four such patients in June 1988 through May 1989. Review of the medical records of the 20 patients indicated that 1) all had been admitted to one medical ward during the 6 months before becoming HBsAg-positive; 2) 18 had diabetes mellitus; 3) during hospitalization, capillary blood samples were obtained from 19 patients to measure blood glucose levels using a spring-loaded device to prick the finger; and 4) one patient with diabetes who had been admitted March 15, 1989, was a hepatitis B virus carrier and may have been the source of the outbreak.

Additional testing of patients who had been hospitalized on the medical ward identified seven additional cases, for a total of 27 persons with acute HB admitted after the HBV carrier patient. Only seven (26%) of the 27 were symptomatic.

Retrospective cohort and case control studies determined that among patients with diabetes, HB occurred in 23 (42%) of 55 who had fingersticks by the spring-loaded device compared with none of five who did not have fingersticks ( $p=0.08$ ). Case-patients had a higher mean number of fingersticks, a higher mean number of insulin injections, and a longer mean length of hospital stay. Among patients without diabetes, three of four had capillary blood sampling by fingerstick with the spring-loaded device compared to none of 20 controls ( $p=0.002$ ).

The index patient was a woman with diabetes who had onset of HB in June 1989; she had been hospitalized continuously for 11 years with amyotrophic lateral sclerosis and had no risk factors for HB other than fingersticks with the spring-loaded device. (Her source may have been a carrier admitted in March 1989.) Because she was hospitalized and became an HBV carrier, she served as a long-term reservoir for HBV on the medical ward.

The hospital indicated that only one type of spring-loaded capillary blood sampling device was used in its inpatient services; this device employs a disposable

lance to prick the skin and a disposable platform to stabilize the device on the finger and control the depth of the puncture. Interviews with the nursing staff indicated that although the nurses always changed the lancets between uses, they did not routinely change the platform after each use or clean the device between uses on different patients.

### Editorial Note:

This is the first reported outbreak of HB associated with the use of fingerstick devices in the United States. An HB outbreak in which a similar fingerstick device was implicated was recently reported in France. That investigation found that the platform of the sampling device had visible blood contamination in 20 (24%) of 85 finger-sticking tests, suggesting that the platform may be easily contaminated with blood from the skin puncture.

HBV circulates in the blood at high titers and can remain viable for at least 1 week in blood samples that have dried on surfaces. **The following recommendations should be followed when using any device to obtain capillary blood samples:**

- Lancets and platforms should be changed after every use of the spring-loaded device; always order an equal number of platforms or endcaps when reordering lancets.
- Because platforms may not be routinely changed after each use, fingerstick devices with disposable platforms optimally should be used only on individual patients.
- If used on multiple patients, after disposal of the lancet and platform, the device should be cleaned and disinfected at the end of the day and more frequently if visibly contaminated with blood.
- Some spring-loaded fingerstick devices do not employ disposable platforms. Use of these devices also optimally should be restricted to one patient, but if used on multiple patients, the lancet should be discarded and the device disinfected between patients.
- The FDA recommends that the manufacturers' guidelines for disinfection be followed. When no instructions for disinfection are provided, the device should be discarded.
- Fingerstick devices that do not have disposable lancets should be restricted to use in only one patient and, because they cannot be disinfected, should be discarded when no longer needed by the patient.
- Dispose of both lancets and platforms in an appropriate sharps container.

# IMPORTANT INFORMATION ABOUT PNEUMOCOCCAL DISEASE AND PNEUMOCOCCAL POLYSACCHARIDE VACCINE

PLEASE READ THIS CAREFULLY

PNEUMOCOCCAL  
9/1/89

**WHAT IS PNEUMOCOCCAL DISEASE?** *Streptococcus pneumoniae* is a bacterium that causes much illness and death in the United States each year. This bacterium, also called the Pneumococcus, can cause serious infections of the lungs (pneumonia), the bloodstream (bacteremia), and the covering of the brain (meningitis). About 5 persons out of every 100 who get pneumococcal pneumonia, about 20 out of every 100 who get bacteremia, and about 30 out of every 100 who get meningitis die of these infections. Anyone can get pneumococcal disease; however, persons over 65 years of age, the very young, and persons of any age who have special types of health problems have the greatest risk.

People are more likely to die from pneumococcal disease if they have problems such as alcoholism, heart or lung disease, kidney failure, diabetes, or certain types of cancer. Older persons as a group are more likely to die from pneumococcal disease. Forty out of every 100 persons who have these special health problems die when they develop pneumococcal bacteremia and 55 out of 100 with these special health problems die if they get pneumococcal meningitis. The high risk of death occurs in spite of treatment with drugs like penicillin. Because of the risk of serious complications from pneumococcal infection, vaccination is recommended for older persons and for children and adults with special health problems.

## **PNEUMOCOCCAL POLYSACCHARIDE VACCINE:**

The pneumococcal polysaccharide vaccine contains material from the 23 types of pneumococcal bacteria that cause 88 percent of pneumococcal bacteremias. Most healthy adults

who receive the vaccine develop protection against most or all of these types of pneumococcal bacteria 2-3 weeks after vaccination. Older persons and those with some long-term illnesses may not respond as well or at all. Children under 2 years of age are also not protected by the vaccine. The vaccine probably provides long-term protection for most people. However, some people may lose protection about six years after vaccination and require revaccination. Persons in need of revaccination are discussed in the "Revaccination" section. The vaccine is given by injection.

## **WHO SHOULD RECEIVE PNEUMOCOCCAL POLYSACCHARIDE VACCINE?**

Vaccination is recommended for the following:

### **Adults**

1. All adults aged 65 years and older and adults of all ages with long-term illnesses that are associated with a high risk of getting pneumococcal disease, including those with heart or lung diseases, diabetes, alcoholism, cirrhosis, or leaks of cerebrospinal fluid (CSF, the fluid surrounding the brain and spinal cord).
2. Adults with diseases that lower the body's resistance to infections or who are taking drugs that lower the body's resistance to infections, including those with abnormal function or removal of the spleen, Hodgkin's disease, lymphoma, multiple myeloma, kidney failure, nephrotic syndrome (a type of kidney disease) or conditions such as organ transplantation.

(PLEASE READ OTHER SIDE)

- Adults with and without symptoms who are infected with the AIDS virus (HIV infection).

#### Children

- Children 2 years of age and older with long-term illnesses that are associated with a high risk of getting serious pneumococcal infections. This includes children with abnormal function or removal of the spleen, as well as those who have sickle cell disease, nephrotic syndrome (a type of kidney disease), or CSF leaks (leaks of cerebrospinal fluid which surrounds the brain and spinal cord), or who have diseases that lower the body's resistance to infections or are taking drugs that lower the body's resistance to infections.
- Children 2 years of age and older infected with the AIDS virus, both with and without symptoms.

(Note- Frequent diseases of the upper respiratory system, including infections of the ear or sinuses, in children who are otherwise healthy, are *not* reasons to use this vaccine.)

#### SPECIAL GROUPS

Persons living in special places or settings with a high risk of getting pneumococcal disease, such as certain Native American (i.e., American Indians) populations.

#### General Considerations

Although this vaccine may not be as effective in some persons, especially those who do not have normal resistance to infections, vaccination is still recommended for such persons because they are at high risk of developing severe disease.

#### POSSIBLE SIDE EFFECTS FROM THE VACCINE:

About half of those who are given pneumococcal vaccine have very mild side effects, such as redness and pain at the injection site. Less than 1 percent of those given pneumococcal vaccine may develop fever, muscle aches, and severe local reactions. Serious side effects, such as severe allergic reactions, have rarely been reported. Revaccination after periods

longer than 13 months from the first vaccination has not been shown to increase the occurrence of side effects. As with any drug or vaccine, there is a rare possibility that allergic or more serious reactions or even death could occur.

**REVACCINATION:** Revaccination should be considered for certain groups:

- Persons at highest risk of fatal pneumococcal infection, such as those with abnormal function or removal of the spleen who received the original pneumococcal vaccine (between 1977 and 1983), or who received the current vaccine (available from 1983 to the present) 6 or more years ago.
- Other persons shown to lose protection rapidly, such as persons with nephrotic syndrome, kidney failure, or transplants, who received the current vaccine (available from 1983 to the present) 6 or more years ago.
- Children aged 10 years or younger with nephrotic syndrome, abnormal function or removal of the spleen, and sickle cell anemia who received the vaccine 3 to 5 years ago.

**PREGNANCY:** The safety of pneumococcal vaccine for pregnant women has not been studied. It should not be given to healthy pregnant women. Women who are at high risk of pneumococcal disease and who are candidates for pneumococcal vaccine ideally should be vaccinated before pregnancy.

**QUESTIONS:** If you have any questions about pneumococcal disease or pneumococcal polysaccharide vaccine, please ask now or call your doctor or health department before you sign this form.

**REACTIONS:** If the person who received the vaccine gets sick and visits a doctor, hospital, or clinic during the 4 weeks after receiving the vaccine, please report it to:

#### PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

PNEUMOCOCCAL 9/1/89

*I have read or have had explained to me the information on this form about pneumococcal disease and pneumococcal polysaccharide vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of the pneumococcal vaccine and request that the vaccine be given to me or to the person named below for whom I am authorized to make this request.*

# A New Strategy to Improve Patient Care

**H**ealth can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

### Training Programs Include:

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

- weight reduction and maintenance
- modified fasting: Optifast
- limited diets: Optitrim
- full food control: LEARN<sup>®</sup>
- stress management

- all medical disorders

# The President's Letter

Prepared by the President of the Medical and Chirurgical Faculty of Maryland as a service to its members

Medical  
and Chirurgical Faculty  
of Maryland

January 1991

## It Works When We All Are Together - Physicians and Representatives Alike...

Dear Colleague:

Thank you! Your hard work and efforts to have the CLIA-88 federally-proposed clinical laboratory regulations rewritten have paid off. Health and Human Services Secretary, Louis W. Sullivan, and Health Care Financing Administration (HCFA) Director, Dr. Gail Wilensky, have indicated that major portions of the regulations will have to be rewritten based on more than 50,000 comments received during the 120-day extended comment period. Included in the comment count are more than 250 letters from members of Congress.

Maryland physicians should be exceptionally pleased and sincerely grateful to Senator Barbara A. Mikulski, one of the law's original sponsors, who cautioned HCFA to develop final regulations based on the best available scientific information and common sense to make the regulations both practical and effective without sacrificing access to needed care. We applaud the Senator's responsiveness to this crucial access issue.

In an unprecedented action, the Executive Office of the President, the Office of Management and Budget, has formally commented on the proposed regulations by saying that "it is not clear that the regulatory objectives (of CLIA-88) are chosen to maximize the net benefits to society." It further stated that HCFA should finish a regulatory impact analysis assessing the costs and benefits of the chosen approach before publishing a final rule.

Dr. Gail Wilensky indicated the need to reassess the levels of testing and personnel standards. She also indicated the need to reassess ways to accommodate and encourage evolving technologies.

The American Medical Association (AMA) will ask HCFA to publish any significant redraft of the regulations so that physicians and others can comment on any "new" approach. Estimates at this time indicate that a final rule will not be completed for eight to twelve months.

Med Chi will keep you apprised of continuing CLIA-88 developments as they occur.

Thank you, once again, for your timely response to this critical practice issue.

Sincerely,

A handwritten signature in dark ink, reading "Reynaldo L. Lee-Llacer MD". The signature is fluid and cursive, with a large initial 'R'.

Reynaldo L. Lee-Llacer MD  
President

effectively meet your needs as a Maryland physician, Med Chi must maintain an extensive framework of committees to uphold prior commitments, manage current programs, and formulate new policy. It is essential that these committees be comprised of interested members so that Med Chi will remain a strong, viable, and active organization.

Please indicate your willingness to serve by checking your committee reference and special interests on the reply card. Every effort will be made to appoint you to the committee of your choice.

I intend to appoint as many members as possible to committees to ensure Med Chi's continued growth as the leading voice for medicine in Maryland.

Thank you for your support.  
J. David Nagel MD  
President-elect

I am interested in serving on the following Med Chi committees.

- ☐ AIDS Committee
- ☐ Alcoholism and Chemical Dependency Committee
- ☐ Computers in Medicine Committee
- ☐ Continuing Medical Education Review Committee
- ☐ Drugs Committee
- ☐ Emergency Medical Services Committee
- ☐ Finance Committee
- ☐ Hospital Medical Staffs Committee
- ☐ Insurance Fund of Med Chi Committee
- ☐ Legislative Committee
- ☐ Liaison Committee with Medical Assistance Program
- ☐ Library and History Committee
- ☐ Long Term Care and Geriatrics Committee
- ☐ Managed Care and Third Party Liaison Committee

## Executive Director's Newsletter

January 1991

### Committee Selection Cards

### Physician Volunteers for the Board of Physician Quality Assurance Needed

Med Chi members interested in serving on a Med Chi committee during 1991-1992 should complete the committee selection card following this newsletter. All members should complete this card by March 31, 1991 in order to be considered for appointment to a Med Chi committee.

Med Chi is seeking practicing licensed Maryland physicians who are interested in serving as members of the Board of Physician Quality Assurance. Med Chi is responsible for submitting a list of physicians who meet this requirement to the Governor. Med Chi is soliciting for volunteers from component medical societies and is advertising in the news media for volunteers to fill a potential vacancy created by an anticipated resignation.

Med Chi membership is not a requirement for appointment to the Board of Physician Quality Assurance.

If you are interested in serving on the Board of Physician Quality Assurance, please send your curriculum vitae to:

Executive Director, Med Chi  
1211 Cathedral Street  
Baltimore, MD 21201-5585

For more information contact the Executive Director at 301-539-0872 or 1-800-492-1056.

## No-Fault Insurance

Since there has been a great deal of misunderstanding among some members concerning the no-fault issue, the following is provided for your information. Interestingly, there has been no change in the basic philosophy on this matter from the earliest considerations through to the official policy adopted by Council during its November 15, 1990 meeting.

In August, Med Chi President, Reynaldo L. Lee-Llacer MD, established an ad hoc committee to study this issue and submit reports to the Executive Committee. The Executive Committee reviewed the ad hoc committee's reports and forwarded a recommendation to the Med Chi Council for consideration at its meeting on September 15, 1990.

The Baltimore City Medical Society and the Baltimore County Medical Association also proposed resolutions on this issue which were forwarded to the Council for the September 15, 1990 Semiannual meeting. The Council discussed this issue at length and remanded back to the Executive Committee the two resolutions as well as the ad hoc committee's recommendations for extensive review by the Executive Committee. The Executive Committee then presented its recommendation to the Council which passed the following resolution on November 15, 1990:

*"The Medical and Chirurgical Faculty has no position on the basic issue of no-fault auto insurance. This position does not preclude the Faculty from taking action on issues related to no-fault insurance such as medical definitions, medical care, or physician fees which directly affect the practice of medicine. Therefore, the Legislative Committee is directed to keep abreast of any no-fault legislation introduced and to make appropriate recommendations to the Executive Committee on issues in such legislation which affect the practice of medicine." (Med Chi Council, 11/15/90).*

This position, therefore, is the result of two intensive deliberations by Council as well as two reviews by the Executive Committee, several ad hoc committee meetings, and input from the Baltimore City Medical Society and the Baltimore County Medical Association.

---

## *Medical Mutual Announces 20% Dividend Credit*

---

The Medical Mutual Liability Insurance Society of Maryland recently announced that all Medical Mutual members will receive a 20 percent dividend credit off their total professional liability insurance premium when their policies renew in 1991. This credit is in addition to any discounts that a member may receive. This special dividend credit is the direct result of the cumulative effects of tort reform and insurance legislation. In the time since the first measures went into effect on July 1, 1986, it appears that the claims side of the liability situation has stabilized somewhat. Both Med Chi and Medical Mutual are indebted to Governor William Donald Schaefer and the General Assembly for making this reform possible. Most importantly, Med Chi is grateful to the physicians who responded to Med Chi's call for action on this issue.

---

## *Medical Mutual Offers Policy "Freeze" for Physicians on Active Military Service*

---

Medical Mutual recently announced that, as the Persian Gulf Crisis continues, it will suspend or "freeze" current professional liability insurance policies for its members who are called to active military service.

Under the policy freeze, you will owe no premium for the time that you are away. Medical Mutual will, however, cover claims related to treatment provided to civilian patients prior to your military service which are reported during such service, in accordance with the terms of your policy.

When you return from military duty, notify Medical Mutual to resume your coverage and you will be credited for any monies outstanding at the time you went on duty and you will be sent a corrected invoice for the remainder of the policy year. Time served with the military does not move you forward toward an increased claims-made year, and it does not earn time toward the 15-year tail, the 5-year retirement tail, or any other credit or benefit which is related to the number of years you are insured with Medical Mutual; policies are truly "frozen" during the time you are away.

If you are called to duty, please contact your Medical Mutual broker or member services representative immediately to suspend your policy (301-785-0050 or 1-800-492-0193).

---

## *1991 Annual Meeting*

---

Med Chi's 193rd Annual Meeting will be held on Wednesday, May 8 thru Saturday, May 11, 1991 at the University of Maryland Center of Adult Education in College Park, Maryland. A pre-registration flyer is packaged with this issue of the *MMJ* for your convenience. Mark your calendar, send in your pre-registration form and watch future issues of the *MMJ* for more details about the meeting. To pre-register by phone or for additional information, call Michael Moran at 301-539-0872 or 1-800-492-1056.

---

## *1991-1992 Med Chi Membership Directory*

---

A copy of the 1991-1992 *Med Chi Membership Directory* is being mailed to you with this issue of the *Maryland Medical Journal*. The *Directory* lists all Med Chi members by county and is an excellent resource for all Maryland physicians. This year's *Directory* features Med Chi officers, Med Chi 1991 meeting dates and component society contacts. The last section of the *Directory* includes an allied health professional listing of medical services that may benefit your patients. To order an additional *Directory* or to update your *Directory* listing, contact Wanda Griebel at 301-539-0872 or 1-800-492-1056.

---

## Legislative Directory

---

Beginning on page 43 of this issue of the MMJ is *Med Chi's 1991 Maryland State Legislative Directory*, a reference guide designed to familiarize physicians with their state representatives and the legislative process. This *Directory* provides lists of Maryland Senators and Delegates with their addresses and phone numbers. This guide also provides descriptions of the legislative process and dates of interest during the session. Physicians are strongly encouraged to use this valuable resource throughout the 1991 legislative session.

---

## Physician's Practice Digest

---

The premiere issue of the *Physician's Practice Digest (PPD)* has been enthusiastically received by readers in Maryland and across the country (See letter from the editor on page 66). If you have any suggestions, opinions or an interest in contributing articles to the next *PPD*, scheduled to be mailed on April 1, 1991, please send correspondence to Editor, *Physician's Practice Digest*, 1211 Cathedral Street, Baltimore, MD 21201.

---

## Straight Forward

---

In the coming weeks, all Maryland physicians will receive the January issue of *Straight Forward*, a newspaper designed to inform Maryland physicians about news and information related to drug and alcohol rehabilitation. This issue of *Straight Forward* is dedicated to AIDS and Chemical Dependency and includes an article on Med Chi's October Drug Conference. If you have any suggestions, opinions or an interest in contributing articles to *Straight Forward*, contact Vivian Smith at 301-539-0872 or 1-800-492-1056.

---

## New Music Medicine Committee

---

The Ad Hoc Music Medicine Clearinghouse Committee became the standing Music Medicine Clearinghouse Committee at the Semiannual meeting in September. Committee members are currently developing a session for the 1991 Annual Meeting which will focus on upper extremity problems of instrumental musicians. The Music Department at Towson State University has expressed interest in setting up a formal liaison with the committee to study the possibility of cooperative educational efforts, research, etc. The Clearinghouse staff has been chosen as the information provider for the Student Musician Pilot Project, currently under development by the International Arts-Medicine Association (IAMA). This project will provide monthly information packets to selected conservatories throughout the United States. Grant funding as well as the actual division of responsibilities between the Clearinghouse and IAMA have yet to be worked out. Med Chi staff member and Clearinghouse Coordinator, Susan E. Harman, authored a chapter in the *Textbook of Performing Arts Medicine*, edited by Robert Sataloff MD, Alice Brandfonbrener MD and Richard Lederman MD, which was recently published by Raven Press. For more information about Clearinghouse activities, contact Susan Harman at 301-539-0872 or 1-800-492-1056.

---

## Doctor/Lawyer/ Teacher Partnership Against Drugs

---

Physicians from the Baltimore metropolitan area interested in volunteering for the Doctor/Lawyer/Teacher Partnership Against Drugs are invited to attend one of the volunteer orientation sessions on January 7th and 9th at 6 p.m. in the Med Chi Faculty Building. Additional physician volunteers are needed to participate in this new program that will bring doctor/lawyer education teams into schools to talk with 7th graders about the hazards of drug use. To register for the meeting or to volunteer for the program, contact Betsy Newman at 301-539-0872 or 1-800-492-1056.

---

## *Living Wills and Powers of Attorney for Health Care*

---

Below is a brief explanation of the legal status of, and relationship between, the living will and the power of attorney for health care which was provided by the Maryland Office of the Attorney General. Physicians with questions or comments regarding this relationship should contact Steve Buckingham at 301-539-0872 or 1-800-492-1056.

In the view of the Attorney General, Maryland law affords competent persons the right to make their own decisions about whether to accept medical treatment, including life-sustaining treatment. There are three ways in which a person can make this kind of decision in advance, so that the person's wishes can be carried out even if the person later becomes disabled:

1. through a discussion with his or her physician, the essence of which is reflected in the patient's medical records;
2. in a living will; and
3. in a power of attorney for health care.

In two opinions in the past two years, the Attorney General has tried to clarify what these latter two legal documents are and how they might be used.

In brief, a living will is a formal advance decision by the individual to decline life-sustaining treatment when death is imminent as a result of a terminal illness. The living will is meant to speak for itself; it amounts to an instruction from the patient to the physician to be carried out when the conditions specified in the law are satisfied.

A power of attorney for health care is a different kind of document. In its most basic form, this kind of power of attorney is a statement by the patient that, in the event of the patient's disability, a named person - the agent - is to have the same decision-making power about treatment choices that the patient would have if he or she were still competent. The agent would then make decisions based on the agent's sense of what the patient would want. A power of attorney may, but need not, go on to contain instructions to the agent about how to decide particular issues - for example, when to decline life-sustaining treatment on the patient's behalf.

The durable power of attorney has several advantages over the living will. It gives the designated agent legally effective decision-making authority over the full range of medical decisions, many of which cannot be precisely anticipated in advance. Moreover, it is not limited, as the living will is, to situations of imminent death from a terminal illness. A power of attorney can be used, for example, to empower an agent to decline life-sustaining treatment in the event of a persistent vegetative state. If the patient had not executed a power of attorney for health care, a family seeking to stop treatment would be required to go to court.

The choice about whether to execute one or both of these documents is entirely up to each individual. A person might decide to sign only a living will, and not a power of attorney for health care, perhaps because the person cannot identify an appropriate agent to exercise broad decision-making power. Certainly, the power of attorney for health care is an option that patients should be invited to consider. However, the living will remains a legally effective decision-making tool, and patients who choose to execute a living will alone should not be dissuaded from that choice.

Angelo J. Troisi, FACHE  
Executive Director

*"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."*

Theodore C. Patterson, M.D., Medical Director,  
Meridian Nursing Center—Heritage

#### **Partners in Healthcare**

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility, Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dietitians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—  
The Professional Choice.

## Adjuvant Therapy in Breast Cancer Patients With Negative Lymph Nodes: An Update

In spite of the long held view that patients with no metastases to their axillary lymph nodes (negative nodes) have better prognosis than those with positive nodes, data from the National Surgical Adjuvant Breast/Bowel Project (NSABP) indicate that patients with negative lymph nodes (L.N.) have a 20 percent recurrence rate with a 15 percent death rate in the first five years, and a 40 percent failure rate with a 32 percent death rate at ten years. Such data clearly indicate that these patients constitute a heterogeneous group and that some of them are at high risk for recurrences and metastases. In an attempt to identify the high-risk group among these node-negative patients, data related to age, tumor size, cell differentiation, tumor ploidy, and hormone receptor status were analyzed. None of these factors seemed to affect the survival except for the hormone receptor status. Patients with estrogen receptor (ER) positive tumors had better survival than those who had ER negative tumors. However, the difference was marginal with an 8 percent better disease-free survival rate for the ER positive group. Furthermore, higher ER values failed to enhance the difference.

Based on these data, the NSABP conducted two clinical trials. In Protocol B-13, patients with tumors who had an ER less than 10 fmol/mg protein (ER negative) and who had negative L.N., were randomized after potentially curative surgery to receive no further treatment vs a combination chemotherapy that consisted of high dose methotrexate - 100 mg/m<sup>2</sup> intravenously (I.V.) on days one and eight; 5-fluorouracil (5-FU) - 600 mg/m<sup>2</sup> I.V. on days one and eight; and leucovorin - 10 mg/m<sup>2</sup> every six hours for six doses, as a folate rescue. This program was administered once every twenty-eight days for one year. In Protocol B-14, patients with tumors who had an ER of more than 10 fmol/mg protein (ER positive tumors) and whose L.N. were negative for metastasis were randomized after surgery to receive placebo vs tamoxifen (Nolvadex<sup>®</sup>) - 10 mg orally, twice per day, for five years.

In the November 1988 issue of the *Maryland Medical Journal*, I reported the early results of a short-term follow-up which revealed beneficial effects in both treated groups, i.e., those who received chemotherapy in Protocol B-13, and those who received Nolvadex in Protocol B-14. Such results were noted in the disease-free survival in premenopausal as well as postmenopausal women, and were confirmed by a similar study from the Eastern Cooperative Oncology Group (ECOG Protocol 1180). At the same time, there was no evidence of prolongation of the overall survival. Furthermore, the National Consensus on Breast Cancer highly recommended that all patients who are node-negative should receive adjuvant therapy.

Now, after five years of follow-up, the results of

Protocol B-13 reveal that only premenopausal patients benefited from the chemotherapy and had significantly better disease-free survival ( $P=0.002$ ), although there was no significant difference in the overall survival. Furthermore, there was no significant difference in the disease-free and overall survival in postmenopausal women.

On the other hand, the results of Protocol B-14 showed that there was benefit only in the disease-free survival of those who received tamoxifen, whether they were premenopausal ( $P=0.0001$ ) or postmenopausal ( $P=0.0005$ ). It should be noted that the premenopausal women entered on this study had to have ER positive and progesterone receptor positive tumors. There was no evidence that there was any effect on the overall survival. It seems that there is room for improvement.

Therefore, the NSABP has initiated three studies. The first, Protocol B-19, compares sequential administration of methotrexate + 5-FU + leucovorin vs cyclophosphamide (Cytosan<sup>®</sup>) + methotrexate + 5-FU. Each treatment arm is being carried out for six months. This is to find out which treatment program may yield better results in primary breast cancer patients with negative nodes and ER negative tumors.

The second study, Protocol B-20, is designed to determine the worth of chemotherapy and tamoxifen over tamoxifen alone in patients with primary invasive breast cancer, negative axillary lymph nodes, and estrogen receptor positive tumors. Randomization includes tamoxifen vs methotrexate + 5-FU + leucovorin + tamoxifen vs cyclophosphamide + methotrexate + 5-FU + tamoxifen.

The last study, Protocol B-21, is designed to determine the worth of tamoxifen and radiation in the management of patients with primary invasive carcinoma of the breast, and with negative lymph nodes for metastases who are treated by lumpectomy. Randomization includes radiation therapy alone vs radiation therapy + tamoxifen vs tamoxifen alone. A large number of patients are needed to answer several important questions related to the best treatment in node-negative patients.

The Surgical Oncology Program at the University of Maryland, being an active member of the NSABP, is seeking large patient accrual throughout Maryland and the surrounding states to be treated according to these studies. Patients can be treated in their community, by their own physicians, under the guidelines of the NSABP. I highly recommend that negative lymph node patients be admitted on a controlled study to find the most effective therapy.

At the University of Maryland, call E. George Elias MD at 301-328-5224; at Mercy Hospital Center, call Marvin J. Feldman MD at 301-783-5858; at Harbor

## A Clinical Moment With . . . Diabetes

### Label Reading for Health

*Doctor, I am having difficulty understanding package labels in the grocery store. Can you give me some guidance as to how to interpret them in relation to my meal plan?*

A grocery shopping trip can be quite a challenge when one considers the need to interpret food labels. However, basic guidelines for analyzing labels can result in more nutritious food choices, making the effort and time an investment in good health.

The first step is to analyze the ingredients, which are listed in order of concentration from the greatest to the least. Fats, sugars, and salt are ingredients many consumers attempt to control. If these are among the first three listed ingredients, the food may contain amounts which are sufficient to warrant limitation of its use.

Recognizing appropriate fats as ingredients is important. Unsaturated fats do not elevate blood cholesterol levels. Monounsaturated fats are olive oil, canola oil, and nut oils. Polyunsaturated vegetable and seed oils include corn, cottonseed, safflower, sunflower, and soybean. Saturated fats are unacceptable because they tend to raise blood cholesterol levels. These include coconut oil, palm and palm kernel oil, chocolate (cocoa butter), animal or meat fat, butterfat, and hydrogenated fat.

The nutritional portion of the label provides grams and milligrams of various nutrients and calories per serving. Analyzing grams of fat is especially important. Dietary guidelines recommend that calories derived from fat should be 30 percent or less of the total calories. Beware of foods that claim to be mostly "fat-free" by weight (e.g., 97 percent fat-free). These products may not be "low-fat" in terms of the percent of fat calories. Fat calories can be calculated by multiplying the grams of total fat by nine calories. The percentage of fat calories can then be determined by

comparing the fat calories to the total food calories. A rule to remember is that foods will automatically qualify as "low-fat" if there are no more than three grams of fat per 100 calories.

People with diabetes may wish to analyze cereals for sugar content. Cereal products usually have a separate nutritional label section (bottom panel on the side of the box) listing starch, sucrose, other sugars, and fiber. Cereal choices should be limited to those that list no more than five grams in the sucrose and other sugar category.

Many food labels now list sodium as part of the nutritional information. A product may be labeled "low-sodium" if it has 140 mg or less of sodium per serving. The term "very low sodium" indicates 35 mg or less. "Reduced sodium" signifies the food contains 75 percent less sodium than the regular product.

The Food and Drug Administration (FDA) has established basic guidelines for food labeling. However, several legislative measures have recently been introduced to Congress which promote revising the food label format and instituting mandatory nutritional labeling of all foods. Interested consumers may write to the following address to suggest ways to simplify food labels and make them more understandable:

## A Note from Med Chi's President and the Legislative Committee

**W**e are pleased to present once again an issue of the *Maryland Medical Journal* on legislative issues that will affect Medicine and physicians in particular. This issue is also dedicated to Med Chi's goal of providing information to its members on legislative matters. This Legislative Issue and the accompanying Legislative Directory are valuable tools for physicians that will enable them to understand and influence the legislative process.

This year, Mandated Medicare Assignment, Regulation of Physician Fees, No-fault Insurance, Triplicate Prescriptions, and Physician Ownership and Referral are just a few of the many pressing issues facing Med Chi in Annapolis. In order to be justly represented, it is necessary for Maryland physicians to become informed and involved. However, knowledge is not enough; we cannot succeed without competent, experienced legal representation.

Med Chi hopes that the information contained in this issue will bring physicians closer to active involvement in Annapolis -- closer to having their voices heard in the State House.

*Reynaldo L. Lee-Llacer MD*  
President

*Susan R. Guarnieri MD*

# Defending Medicine in Maryland

---

Angelo J. Troisi FACHE, Executive Director

---

As each of us in the medical profession in Maryland contemplates the upcoming session of the Maryland General Assembly, one fact becomes clear: we cannot face the challenges alone. It is for this reason that, in September of 1989, Med Chi's Council entered into a five-year contract with the law firm of Rifkin, Evans and Silver. Through this contract, the firm provides legislative and legal advice on all matters facing the Faculty.

The principles in the firm are The Honorable Edgar P. Silver, Mr. Alan M. Rifkin and Mr. Gerard E. Evans. Among other professional accomplishments, Judge Silver brings to the firm twelve years in Annapolis as chairperson of the powerful transportation committee, where he earned a reputation as a sage and practical problem solver. Mr. Rifkin has had experience as Counsel to the Senate and held the top slot in Governor William Donald Schaefer's legislative team as his Chief Legal Officer. Some of the great successes in tort reform are a result of Mr. Rifkin's undaunted perseverance on the behalf of physicians. The third member of the partnership is Gerard Evans who solidly represented the Faculty for three years prior to his association with the firm. After much success during the 1990 Session, the firm has further strengthened its staff to continue providing superb representation in Annapolis.

During the 1990 Session, the firm successfully represented Med Chi in the consideration of several issues including:

- Mandated Medicare Assignment;
- the institution of a triplicate prescription system;
- the Health Services Cost Review Commission's (HSCRC's) regulation of radiologists, anesthesiologists, and pathologists; and
- physician ownership.

In 1991, Med Chi will face some of these same issues along with many other challenges. (See "The 1991 Maryland General Assembly: What Can We Expect?" on page 27.)

While the state government and legislative experience of Rifkin, Evans and Silver continue to be our best defense in Annapolis, component medical societies from across Maryland have also greatly influenced the level of legislative success Med Chi has enjoyed in the last few years. Through the activities of the local legislative committees and their contributions to Med Chi's Legislative Committee, physicians at the component level have delivered the ideas and support necessary to win on the important issues.

Defending the practice of medicine remains a difficult and complicated endeavor. No longer can one attorney or lobbyist provide all that physicians need to survive the regulatory onslaught. As our success during the 1990 Session demonstrates, the team approach provided by Rifkin, Evans and Silver in concert with our component societies is the best defense that Maryland physicians have to offer. It is our sincere promise that the continuation of this relationship will directly benefit each and every member of the Faculty, and of course, every citizen of Maryland.

---

---

# The 1991 Maryland General Assembly: What Can We Expect?

---

Gerard E. Evans, Esquire and Gregory Don Hall PD, JD, LL.M

---

*Mr. Evans is a partner in and Mr. Hall is a legislative liaison with the law firm of Rifkin, Evans and Silver which represents the Faculty on legal and legislative matters.*

Several legislative initiatives that arose during the 1990 Legislative Session will probably be seen again in the upcoming 1991 General Assembly. This article will address issues likely to resurface as a result of their demise last year, as well as provide our first impressions of new issues that may arise this year.

---

*Numerous issues affecting the practice of Medicine will likely be addressed in the 1991 Maryland General Assembly including Mandated Medicare Assignment, Regulation of Physicians Fees, No-Fault Insurance, Triplicate Prescription, Physician Ownership, Fraudulent Claims, and AIDS.*

---

## Mandated Medicare Assignment

Although Mandated Medicare Assignment was defeated for the fourth consecutive time in last year's Session, Delegate Paul Pinsky (Prince George's County), chief sponsor of last year's bill, will likely reintroduce a similar bill prohibiting physicians from charging Medicare beneficiaries an amount in excess of what Medicare pays. The 1990 bill never reached the House floor because of its defeat in the House Environmental Matters Committee by a vote of 17-6. It is hoped that this year's bill will meet the same fate.

In sum, Mandated Medicare Assignment should not be adopted for the following reasons:

1. Recent federal changes adequately address perceived inadequacies in the Medicare Part B Program.
  - Mandated Medicare Assignment was *clearly rejected* by Congress as a viable alternative to attacking the increase in Part B disbursements.
  - Charges permitted to be billed to Medicare beneficiaries have been changed and will be the lesser of the percentage by which the prior year's Maximum Allowable Actual Charge (MAAC) exceeds the prior year's prevailing rate or the new lower percentage limit.
  - As of September 1, 1990, physicians have been required to submit claims for Medicare beneficiaries whether or not they accept assignments. Claims must be submitted within one year, and no charge can be imposed for processing and submitting such forms. If the physician fails to submit an assigned claim as required, the amount paid shall be reduced by 10 percent.

## New Friends In Annapolis

The 1991 Session of the General Assembly will begin with several new faces. A total of forty-five seats (ten in the Senate and thirty-five in the House of Delegates) will change hands. Three of these seats will be held by Med Chi's newest friends in Annapolis: Delegates Aris T. Allen MD, Rose Mary H. Bonsack MD, and John Hurson. Drs. Allen and Bonsack are members of the Faculty. Mr. Hurson is the husband of Susan Butler Hurson MD, a resident at Washington Hospital Center. The understanding of the medical profession held by each of these distinguished individuals can make them become the Faculty's best new allies in the legislative process.

- Dr. Aris T. Allen is returning to the State House after eight years, having previously served in both the House of Delegates and the Maryland Senate. Dr. Allen practiced medicine with his wife in the City of Annapolis until 1982. His leadership roles in medicine include a term as Vice-president of the Medical and Chirurgical Faculty of Maryland, an appointment to the Board of Medical Examiners, and a period as Director of the Health Standards and Quality Bureau of the Health Care Financing Administration (HCFA).
- Dr. Rose Mary H. Bonsack, a Harford County family practitioner, is serving as an elected public official for the first time. She was born and raised in Harford County, attending Havre de Grace High School, Washington College, and the University of Maryland School of Medicine. Dr. Bonsack graduated from the Medical College of Pennsylvania and was Chief of the Department of Clinics at Kirk Army Hospital in Aberdeen. She is currently serving on the Board of Physician Quality Assurance as Executive Secretary.
- Mr. John Hurson is an attorney in private practice in Bethesda, Maryland. His wife, Dr. Susan Butler Hurson, is a third-year resident at Washington Hospital Center. Mr. Hurson graduated from the Georgetown University School of Law in 1979 and clerked for Judge David Cahoon in Montgomery County. He worked with a law firm handling tax issues before starting his own firm.

- Beginning on January 1, 1992 a resource-based relative value scale (RBRVS) will replace the customary charge-based fee system over a five year phase-in period. RBRVS is expected to increase reimbursement for diagnostic and cognitive services relative to current levels.
  - Medicare Volume Performance Standards (MVPS) have been established for fiscal year 1990 and will be established for subsequent years as well. MVPS will be a target for aggregate Medicare outlays for physician care, calculated by a weighted average increase in reasonable charge amounts, volume increases, and changes in benefits and adjusted by a performance improvement standard.
  - Reimbursement for overvalued procedures will be reduced by one-third of the difference between the prevailing charge for the procedure and the RBRVS value, up to a maximum reduction of 15 percent. A procedure would be considered overvalued if its reimbursement exceeds the RBRVS amount by 10 percent.
  - In determining customary charge levels for physicians' services furnished in 1990 and beyond by "new" physicians -- physicians for whom adequate actual charge data are not yet available -- the customary charge levels shall be set at the start of the record calendar year in the practice at no higher than 85 percent of the prevailing charge levels.
2. The amount of physician services available to Medicare beneficiaries will decrease because physicians will be unable to bear the difference in revenue from a Medicare and a non-Medicare patient. Physicians who continue to treat Medicare patients will be forced to stop performing certain procedures when the level of costs is greater than Medicare's reimbursement.
  3. The quality of services provided to Medicare patients will fall. Physician specialists (such as orthopedists, obstetricians/gynecologists, hematologists, and rheumatologists) will be forced to withdraw from the Medicare market because of their inability to recover costs. The law will create a two-tiered system of care in Maryland, where Medicare patients may receive lower quality care because of their limited access to specialists.

For example, as a direct result of Mandated Medicare Assignment in Massachusetts, approximately 20 percent of the orthopedic surgeons have discontinued their practice. Commenting on the findings, Dennis M. Griffin MD, Massachusetts Orthopedic Association President, said, "the shortage of orthopedic surgeons has been growing more severe each year and the trend is alarming. The lack of availability of an orthopedist has already been felt in emergency situations..." A comparable decrease in Maryland of certain designated specialists (orthopedists, obstetricians/

gynecologists, rheumatologists) could lead to disastrous results in the availability of health care.

### Regulation of Physician Fees

Two legislative initiatives that would have placed significant restrictions on fees charged by physicians were defeated in the 1990 Maryland General Assembly.

House Bill (HB) 1248 introduced by Delegate Connelly (Baltimore County) attempted to include anesthesiologists, radiologists, and pathologists within the definition of "hospital services" offered by all facilities regulated by the Health Services Cost Review Commission (HSCRC). If passed, the specialties involved would have had significant restrictions placed on the fees charged for their services.

HB 1195, introduced by Delegate Taylor (Allegany and Washington Counties), would have required the HSCRC to study and analyze the cost of nonhospital health care services, including physician fees. Although at first glance such a study may seem innocuous, it is likely that the data obtained from such a study would be used to bring physicians' fees under regulation by the HSCRC.

It is probable that similar measures will be initiated in the upcoming 1991 Legislative Session. In fact, the Maryland Chamber of Commerce and the Maryland/DC AFL-CIO have formed the Labor-Management Health Action Committee which purportedly will study "why costs are rising at such a rapid pace." A recent article written by the Chairman of the Maryland Chamber of Commerce noted,

In our new attempt to control costs of health care, we'll have no 'sacred cows.' We'll look at doctors and other providers and how much it costs for them to provide care for Marylanders.

That is a "Get The Doctor" approach. These are the facts:

- National data already available indicate that while physician salaries have risen over the past five to six years, the average total expenses of self-employed physicians have increased from \$78,400 in 1982 to \$140,800 in 1988.
- Total professional expenses increased 13.8 percent between 1987 and 1988 alone.
- Individual physician expenses such as student loan repayments are not factored into the above analysis.
- Overall, the annual after tax income for physicians accounts for only a small part of the health care dollars spent in this country, and for the most part is related to time worked (i.e., physicians working eighty hours earn more than physicians working forty hours).
- Total overall medical care costs for the United States are increasing. This is, however, due to the increased number of patients and overall aging of the population. Sophisticated medical

care is, therefore, provided for longer periods of time to more people.

It is important that physicians educate their respective legislators about the negative implications arising from such a fee-regulating system:

1. Massachusetts, in adopting similar fee control mechanisms, has experienced an exodus of physicians in various specialties (e.g., Obstetrics/Gynecology, Surgery, Radiology) because payments made according to the fee schedule do not provide adequate reimbursement to enable them to practice medicine.
2. Although physician services do contribute to overall health care costs, other factors such as the rising costs of prescription drugs, hospital malpractice insurance, and the practice of defensive medicine are *largely* responsible for the escalating costs associated with health care.
3. Physician fee controls will eliminate competition and stagnate the free marketplace.
4. Fee controls will reduce the incentive to pursue new, more expensive technologies.
5. Physicians' fees pay for, among other things, salaries of their employees. Employee salaries are marketplace driven, and any unilateral, selective controls on this one sector of the economy will render physicians unable to compete for the services of high quality employees. This will further exacerbate the trend away from health care careers and lead to shortages of nurses, all types of technologists, medical secretaries, etc.

### No-Fault Insurance

The Governor's Commission on Insurance is in the process of gathering information about changing Maryland's existing automobile insurance system. The Commission is basically composed of people from the insurance industry with very little input from organized medicine or the general public. Governor Schaefer formed the Commission to examine the options for trimming premium costs for Maryland drivers. (According to a 1987 study, Maryland ranked sixth highest among the states for average premiums paid.)

Under a no-fault system, drivers involved in an accident have their own insurers pay for property damage and any personal injuries, with no provision for filing a lawsuit to win pain and suffering damages. The no-fault system rejects the current jury system. A no-fault system removes benefits from the injured and transfers them to the wrongdoer (tortfeasor).

Although a no-fault system is regarded by its proponents as a panacea to high automobile insurance rates, it should be noted that:

- seven of the top ten premium rates in the country exist in states with no-fault systems, and

- premiums in states that have adopted a no-fault system have risen an average of 40 percent.

Currently, a Med Chi representative is attending the meetings of the Task Force on Automobile Insurance and Medical/Legal Rights to gather information. The Task Force is composed of members from the Maryland State Bar, the Women's Bar, the National Association for the Advancement of Colored People (NAACP), Mothers Against Drunk Drivers (MADD), the American Federation of State, City and Municipal Employees (AFSCME), and the Maryland Trial Lawyers Association. Its purpose is to examine the current automobile insurance system in Maryland and recommend changes, if any, that will improve its operation.

Of concern to Med Chi is not the adoption of a no-fault system, but the attendant fee schedule for

physician reimbursement which often accompanies no-fault legislation.

This issue has been referred to Med Chi's Executive Committee for further discussion and deliberation. This is obviously an important issue that will be followed by Med Chi's lobbyists.

### **Triplicate Prescription**

Senate Bill 658, introduced in the 1990 Session by Senator Lapidus (Baltimore City), originally required prescribers to fill out a triplicate form for each Schedule II drug prescribed. The bill was later amended to include prescription drugs in Schedules III and IV also. The bill was defeated largely due to a cooperative effort by lobbyists for Med Chi (Gerry Evans and Alan Rifkin), the Maryland Pharmacists Association, and the Maryland Hospital Association (MHA), among others. The aforementioned lobbyists were successful in drafting a comprehensive DUR (Drug Utilization Review) Program that more effectively targets and curbs drug diversion than does a triplicate prescription program. The DUR Program, adopted by Governor Schaefer in an Executive Order, establishes a Prescription Drug Commission with various duties, and requires the State Division of Drug Control to analyze prescribing patterns of physician prescribers.

Although last year's bill was defeated, the issue of instituting a triplicate prescription program recently resurfaced at a Governor's Drug Commission meeting where it was heralded by proponents as a cure for Maryland's drug abuse problems. It is likely that legislative bills will be reintroduced to institute the program in Maryland.

The American Medical Association (AMA) has denounced triplicate prescription programs noting:

After ten years of national leadership in the fight against drug abuse, including cooperative efforts with more than thirty-five states, the American Medical Association has been unable to find evidence that use of triplicate prescription programs can effectively address misuse and diversion of prescription medication. Instead, such programs put state governments in the position of usurping or undermining the role of the medical community, including professional associations, scientific and educational institutions, individual physicians and their patients, and the federal Food and Drug Administration (FDA), in determining the appropriateness of medical decisions. In the process, these programs threaten the confidentiality of sensitive patient information, impose unreimbursed clerical burdens on physicians and pharmacists, and add unnecessary expenses to already overburdened state budgets while ignoring existing data bases and tools...

Required use of triplicate forms gives a negative message about needed medications to both physicians and patients. Submission of the forms to state government agencies subjects patients to a loss of privacy not normally encountered in the physician-patient relationship. In addition, because most programs require new prescriptions on a monthly or bimonthly basis, patients suffer the inconvenience and extra expense associated with more physician office visits than their medical conditions may warrant.

### **Background on the Report of the Linowes Commission**

The Commission on State Taxes and Tax Structure is expected to issue its report prior to the beginning of the 1991 Session. The Commission, chaired by R. Robert Linowes, has studied Maryland's State and local tax structure over the past eighteen months, analyzing most of the State's major taxes, including individual and corporate income taxes, sales taxes, and property taxes.

The Commission is closely studying the following:

- the adjustment of individual income tax rates in an effort to make the tax more progressive;
- an expansion of the sales tax to include some services; and
- a restructuring of the property tax system for both the State and local government.

Action on the Commission's recommended changes to the State's taxes will depend on the actions of the Governor and the General Assembly. For example, the Governor may include revenue-raising recommendations in his 1991 legislative program to help ease fiscal constraints on the State budget. The General Assembly, on the other hand, may delay all action on the Commission's recommendations until the 1992 Session so it may study the issues in depth.

In any event, the Linowes Commission's recommendations are likely to call for far-reaching changes to the State's tax structure. The Governor and the General Assembly will need to act quickly to resolve these issues before the end of the ninety-day Session.

The negative impact of triplicate prescription programs on the use of the medications they cover is not denied by proponents of this approach. In fact, they point to overall declines in prescriptions for covered medications as evidence of the success of the programs -- without considering that a mere decrease in overall use does not correlate with a decrease in abuse. In fact, in some areas, interfering with appropriate use of medications, as well as abuse, has become an accepted goal. In one state, a regulator commented approvingly that triplicate programs have a 'chilling effect' on physician prescribing by subjecting such decisions to the scrutiny of state enforcement personnel.

This issue will obviously be an important topic of discussion in the 1991 Session. Its impact on physicians and their prescribing patterns makes it a topic that is not to be taken lightly.

### Physician Ownership and Referral

Three bills were introduced during the 1990 Session regarding physician ownership of health care facilities and referral of patients to such entities.

House Bill (HB) 779 would have prohibited a physician from referring a patient to a bioanalytical laboratory in which the physician had a financial interest. That bill, introduced by Delegate Bill Clark (Harford County), is not expected to make a repeat visit this year.

Two Senate Bills (SB 670 and SB 585) will probably be reintroduced in some form in the upcoming Session.

Senate Bill 670, introduced by Senator Dorman (Prince George's County) and Senator Hollinger (Baltimore County), would have prohibited a physician from referring a patient to a health care service or receiving a referral of a patient from a health care service, if the physician would receive a direct or indirect rebate, refund, commission, unearned discount or profit, or other unearned valuable consideration for the referral.

Senate Bill 585 would have prohibited a health care practitioner from referring a patient to a health care service in which the physician had a financial interest, unless the practitioner disclosed this interest to the patient.

The Faculty supported the passage of SB 585, and will support similar legislation this Session, because it codifies principles established in Faculty ethical opinion 405, *Health Care Facility Ownership By Physicians*:

- .01 It is not inherently unethical for a physician to own or own an interest in a hospital, clinic, or other health care facility. However, the use the physician makes of this ownership or interest may be unethical. For example, sending a patient to such a facility solely for the physician's financial benefit would be unethical.
- .02 When a physician has an interest in or owns a hospital, clinic, or other health care facility to which he sends his patients, he has an affirmative ethical obligation to disclose this fact to this patient.
- .03 Under no circumstances may the physician place his own financial interest above the welfare of his patients. Whatever develops between the physician's financial interest and the physician's allegiance to his patient, the conflict must be resolved in the patient's benefit.

## The Maryland State Budget Shortfall

Before the start of the Middle East crisis in August 1990, the State's Fiscal Year 1991 budget deficit was estimated at \$150 million. As of October 1990, the Department of Fiscal Services had more than doubled the deficit estimate to \$322 million, reflecting the effects of higher oil prices and the national economic slowdown. Simply put, the revenue projections made in December 1989 (those which the current budget was built on) will not be attained. Thus, unless spending is decreased, a budget shortfall will occur.

The Department of Fiscal Services is estimating tax revenues to fall short of projections by:

- \$108 million for the individual income tax;
- \$75 million for the sales tax; and
- \$33 million for the corporate income tax.

Adding to the budget problems are anticipated expenditures of \$77 million more than originally budgeted. Two-thirds of this additional spending is directly tied to health care and welfare benefits for the poor.

The budget shortfall is likely to affect all State agencies, including the Department of Health and Mental Hygiene. The Governor has instituted a freeze on hiring and restricted certain purchases of equipment. Agencies have been asked to develop cost containment methods to reduce expenditures in the current fiscal year, as well as to reduce budget requests for fiscal year 1992. A comprehensive plan should be in effect at the beginning of the 1991 Session.

Forms of this legislation will be tracked closely by the Med Chi lobbying team in the upcoming Session because of the possible ramifications they may impose on physicians.

### Fraudulent Claims and Reimbursement

Another bill introduced during the 1990 Session which is expected to return is related to fraudulent claims prevention.

House Bill 346, sponsored by Senator Garrett (Montgomery County), was specifically targeted at health care providers. It was designed to prohibit them from knowingly making fraudulent claims to health care payers.

Med Chi fought the bill for a number of reasons including:

1. The issue of fraudulent claims is sufficiently ad-

The dome of the Maryland State House

addressed in the *Maryland Code Health Occupations Article* which enables the Board of Physician Quality Assurance to revoke, suspend, or reprimand a physician who files a false report or record, or who submits false statements to collect fees for services not rendered.

2. Article 48A, § 233 of the *Maryland Code* provides stiff penalties (\$1000 fine and/or six months imprisonment) against agents, brokers, solicitors, physicians, and others who knowingly or willfully present false or fraudulent claims. This provision negates the need for further legislation.

Perhaps of greater significance than fraudulent

claims is the issue of reimbursement. At a hearing in Annapolis on October 23, 1990, several physicians testified before the House Economic Matters Committee about the difficulties they had experienced in obtaining reimbursement for their services from Blue Cross and Blue Shield and other third-party payers. Horror stories related by several physicians described situations in which reimbursement for services was not completed until six months after billing information was submitted to the third-party payer.

Some possible legislative remedies in this area include:

- a time limit imposed on third-party payers for paying claims;
- the imposition of a standardized billing form for physicians and hospitals to complete when seeking reimbursement; and
- stricter regulations delineating under what circumstances a bill can be rejected or additional documentation required.

#### Acquired Immune Deficiency Syndrome (AIDS)

Several issues from Med Chi's Committee on AIDS have been presented to the Council for discussion and possible legislative action:

*Occupational Exposure of Human Immunodeficiency Virus (HIV):* The Committee on AIDS believes that it is imperative that a health care worker who is exposed to the blood or bodily fluids of a patient in a way which may transmit HIV should know the HIV status of the patient. After such exposure, a health care worker runs the risk of contracting HIV and transmitting

this disease to his/her sexual partners or to an unborn fetus. The behavior of the exposed health care worker is dependent on knowing the HIV status of the patient who was the source of the exposure. HIV may be prevented if AZT is immediately administered after high risk blood exposure. Additionally, individuals who have been exposed to HIV infection require frequent, ongoing tests to determine if they are infected. No one should be subjected to this uncertainty and inconvenience because of inadequate information regarding the status of the HIV exposure. A delay in testing or a refusal by a patient to be tested prevents effective treatment of the exposed individual and in-

creases the risk of the exposed health care worker and others with whom he or she may have intimate contact.

The Committee on AIDS proposes the development of legislation that would insure immediate testing of individuals who serve as the source of a significant exposure to health care workers.

*Current Consent Form for HIV Testing:* At the October meeting, committee members also discussed the Department of Health and Mental Hygiene's (DHMH's) revision of the current consent form for HIV testing which will soon be published in the *Maryland Register*. Although the committee members agreed that the form is a hurdle in the testing of patients, the consensus was that it is necessary due to liability issues. After publication, DHMH will have another comment period at which time Med Chi can once again offer suggestions for simplifying the testing process. Committee members have also recommended that a brochure or a video be created to take the place of pretest counseling.

Although modifying the consent form for HIV testing involves a regulatory vs a statutory change, it is evident that the Committee on AIDS, the Legislative Committee, and Council will spend many hours debating and considering these and other AIDS-related issues during the upcoming Session.

### Conclusion

These are a few of the issues that are expected to be addressed in the upcoming 1991 Maryland General Assembly. It is a foregone conclusion that many other bills affecting physicians and their practices will be introduced. Med Chi's lobbyists, the Legislative Committee, and Council will be asked to respond to those issues with insight, knowledge, and speed when they are presented in Annapolis. Physicians should remember that lobbying is essential to the lawmaking process, but grassroots campaigns begin in physicians' offices where legislators and the voting public are treated. ■

Beautifully executed woodwork enhances the interior of the Maryland State House in Annapolis.

Rifkins, Evans & Silver is pleased to announce that *Stephen Buckingham, Esquire* has become associated with the firm and will provide on-site legal and government relations services to Med Chi and its members. He replaces Gregory Don Hall PD, JD, LLM, who has left to explore other professional opportunities. Before joining the firm, Mr. Buckingham was an administrator with the Maryland Department of Health and Mental Hygiene where he was responsible for regulating health care providers. He subsequently entered private practice, providing assistance to individuals and organizations in health care and general law matters. Mr. Buckingham is available in the Med Chi office to answer your questions. He can be reached at 301-539-0872/1-800-492-1056.

# Continuing...

For over fifteen years, the Med Chi Agency has been serving the needs of Maryland physicians...*your* needs, with unrivaled commitment and dedication. And as the Agency has grown, so has your trust...in us, in our products and in the way we do business with you.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial options. Among these are:

Professional Liability  
Insurance (Malpractice)

Personal insurance, including  
homeowners, auto, boat and  
recreational vehicle coverage  
and personal umbrella  
insurance.

Office insurance, including  
medical equipment, medical  
records, computer equipment,  
account receivables, workers  
compensation, business auto  
and employee dishonesty

Financial and estate planning,  
specifically tailored to the  
medical professional.

Individual and group, life,  
health and income protection.

Qualified and non-qualified  
Retirement Planning

# Protecting The Disabled From Discrimination

---

Stephen C. Buckingham, Esq.

---

*Mr. Buckingham is an attorney with the firm of Rifkin, Evans and Silver, legal counsel for Med Chi.*

---

*As a result of the recently enacted Americans with Disabilities Act of 1990 (ADA), physicians would be wise to examine their practices to assure that there are no actions taken with discriminatory intent.*

---

A physician or health care provider accused of discriminating against someone on the basis of race, religion, sex, or handicap, is likely to plead not guilty to the charges. Most people know that a white may not refuse to sell his house to a person because the buyer is black, that men should not be hired or promoted over women simply because they are men, and that wheelchair ramps should be provided to assure that the disabled can enter and leave public buildings. However, this level of consciousness about discrimination may not be enough to satisfy recent laws on the subject. Physicians and other health care providers may be required to take active steps, to *do* something, instead of merely remembering *not* to do something.

The most recent federal enactment in this area is the Americans with Disabilities Act (ADA),<sup>1</sup> passed by Congress in 1990 and becoming effective in stages beginning in 1992. The ADA prohibits discrimination against persons with disabilities in employment and public accommodations. This simple sounding Act carries with it consequences that are far from simple, consequences that will require a fundamental change in how professionals think about and conduct their daily lives. Almost every employer, person, or group that provides services to the public will have to take active steps to accommodate the needs of disabled individuals.

## Development of Anti-Discrimination Law

The ADA must be viewed in the context of the myriad of anti-discrimination laws that have preceded it. Beginning with the enactment of the Civil Rights Act of 1964,<sup>2</sup> laws aimed at addressing racial, ethnic and religious discrimination have been adopted at the federal level, followed later by state statutes and even some local ordinances. Administrative agencies have been established at all three levels to investigate, prosecute, and decide cases of discrimination. Although originally intended to protect individuals from discrimination in federally-assisted programs and employment on the basis of "race, color, or national origin,"<sup>3</sup> later

The historic Maryland State House remains the focus of Annapolis atop its hill overlooking the Severn River.

steer prospective home buyers away from neighborhoods of a different race, color, religion, sex, or national origin or to refuse to sell, rent, or finance sales for such reasons.<sup>8</sup> This law strengthened the efforts begun earlier to break down the legal barriers of segregated communities. As early as 1948, the United States Supreme Court had refused to enforce a neighborhood's restrictive covenant against blacks, saying that government could not be used to uphold an unconstitutional deprivation of civil rights.<sup>9</sup>

In 1973, Congress passed the Rehabilitation Act,<sup>10</sup> making it illegal for the first time to discriminate against a person on the basis of a physical or mental handicap. As with the Age Discrimination Act, this law only applied to those receiving federal funds. However, since the vast majority of health care providers receive Medicare or Medicaid reimbursement for care, its provisions were felt throughout the health care system. Amendments to the Fair Housing Act effective in 1989<sup>11</sup> broadened its protections to disabled individuals as well. It is now illegal to erect barriers (including zoning laws) that keep physically or mentally disabled people from living in any community they choose.

In 1963, Maryland enacted its first anti-discrimination law<sup>12</sup> and established the Commission on Human Relations to enforce it. Under Article 49B of the *Annotated Code of Maryland* it is now illegal to discriminate against a person in employment, housing, or public accommodation on the basis of "race, creed, sex, age, color, national origin, marital status, or physical or mental handicap."<sup>13</sup> In this regard, Maryland has similar but broader protections than those at the federal level. Local jurisdictions have also adopted anti-discrimination laws, some of which are broader than State law, or have been interpreted by local Human Relations Commissions

as being broader.

### Enforcement

On the federal level, the Equal Employment Opportunity Commission (EEOC) handles employment discrimination complaints and the Justice Department handles cases that occur in public accommodations. The Department of Housing and Urban Development handles housing complaints.<sup>14</sup> Where there is a state mechanism in place, complaints of federal law may also be handled by the state agency.<sup>15</sup> In Maryland, the Human Relations Commission (HRC) is empowered to receive complaints involving housing, employment, and public accommodations, to investigate the charges, and to determine if there is probable cause to believe that a discriminatory act has occurred. If probable cause is found, the HRC attempts to resolve the matter through conference and conciliation. If an

amendments to federal labor laws made sexual and religious discrimination illegal in employment as well.<sup>4</sup>

Other federal laws address discrimination against other groups. The Age Discrimination in Employment Act of 1967<sup>5</sup> aimed at protecting the elderly from discrimination in hiring, promotion, and wages, while the Age Discrimination Act of 1975<sup>6</sup> prohibited age discrimination by recipients of federal funds. Currently, a health care provider in the Medicare or Medicaid program may not refuse to care for a person because that person is above or below a certain age. (While this would appear to prevent a provider, such as a nursing home, from refusing to admit a child under a certain age, the facility could legally justify its action if there were *documented medical reasons* for refusing a particular young patient.)

The passage by Congress of the Fair Housing Act in 1968<sup>7</sup> signaled the spread of legal protections into the housing market. Since that time it has been illegal to

agreement to settle cannot be reached, the HRC conducts a formal hearing and, if discrimination is determined to have occurred, may issue orders to cease discriminatory acts and may award compensation to victims.<sup>16</sup>

Where local jurisdictions have adopted anti-discrimination laws, local human relations or human rights commissions may also be established. The powers and duties of these commissions are similar to those of the State HRC, but they may be applying broader local laws or may interpret similar laws in a broader manner. Baltimore City has its own, as do the following counties and municipalities:

Anne Arundel County	Annapolis
Baltimore County	Cumberland
Calvert County	Potomac
Frederick County	Rockville
Harford County	
Howard County	
Montgomery County	
Prince George's County	
St. Mary's County	

Decisions of the State or a local commission may be appealed to the county circuit court, although reversal of a commission decision is rare. So much deference is paid to the factual findings of an administrative agency (even one like the HRC that is charged with rooting out discrimination), that a court will not substitute its judgment for that of the agency in factual matters. Even if the overwhelming weight of evidence supports a contrary finding, the court will not overturn an agency's factual finding as long as there is *any* evidence to support the agency's decision.<sup>17</sup> This gives the State and local commissions significant power in enforcing anti-discrimination laws.

### Recent Trends

Since the 1964 Civil Rights Act was passed by Congress, the overall trend has been toward increasing legal protections from discrimination. All levels of government have become involved, resulting in increased enforcement. Rather than attempt to preempt the field with its legislation, the federal government has encouraged state and local governments to enact protections that go beyond its laws.

Protections have been extended from racial, ethnic, and religious groups to groups defined by sex, age, and physical or mental disability. On the State level, even marital status is no longer a valid criteria for treating someone differently.<sup>18</sup> Even the definition of handicapped has changed to encompass persons with mental or emotional illness and to include individuals diagnosed with AIDS or as HIV positive.<sup>19</sup>

Anti-discrimination laws have also been applied in

A forest of masts and spars crowd the harbor at Annapolis.

various aspects of life. Employment, housing, and public accommodations are now all subject to legal scrutiny. Local governments have even gone further than the State. While Maryland law specifically defines a public accommodation to mean a place that provides food, drink, lodging, or entertainment,<sup>20</sup> the Howard County Human Rights Commission recently interpreted its local public accommodation ordinance to apply beyond physical establishments to anyone who provides or offers goods or services to the public.<sup>21</sup>

### Americans with Disabilities Act

As broad as the present anti-discrimination laws are, the ADA goes even further. Unlike the Rehabilitation Act of 1973 which only applied to recipients of federal funds, the ADA applies to anyone who employs twenty-five or more people as of July 26, 1992 and fifteen or more people after July 26, 1994.<sup>22</sup> An employer is

prohibited from discriminating against a qualified individual with a disability with regard to job application procedures, hiring, discharge, compensation, advancement, job training, and any other "terms, conditions, and privileges of employment."<sup>23</sup> Enforcement will be handled through the EEOC or the Maryland Human Relations Commission.<sup>24</sup>

Beginning January 26, 1992, the Act also applies to any private entity that owns, leases, or operates a place of public accommodation. A "public accommodation" is broadly defined to include almost any business that provides or offers to provide goods or services to the public, specifically mentioning a "professional office of a health care provider, hospital, or other service establishment."<sup>25</sup> A business may not deny a disabled individual the right to participate in, or benefit from its goods, services, facilities, privileges, advantages, or accommodations. Further, the business may not provide disabled persons with goods, services, or facilities that are separate or different from those provided non-disabled persons, unless it is necessary to ensure that the goods, services, and facilities are as effective for the disabled as for others.<sup>26</sup> The Justice Department will enforce these provisions, but private lawsuits will also be allowed.<sup>27</sup>

The impact of the ADA is also greater than its predecessors. Not only must an employer or public accommodation assure that it avoids actions with discriminatory intent, but it must also make "reasonable accommodations" for individuals with disabilities.<sup>28</sup> This means that an employer or service provider must actively attempt to overcome barriers that confront the disabled. Whether the employer or provider must implement a particular "accommodation" will depend on whether it imposes an "undue hardship" to do so.<sup>29</sup> Although the goal of the ADA is full and equal access for the disabled, the Act itself makes some exceptions in compliance, such as the requirements for elevators.<sup>30</sup> Undoubtedly, the EEOC and Justice Department will provide further guidance in the regulations they are required to propose and adopt in the near future.<sup>31</sup>

### Preparing for Compliance

The fact that the term "disabled" encompasses a variety of medical and psychological conditions is expected to make compliance with the Act more difficult. Yet the Act challenges employers and service providers to consider the disabled in daily operations and to make accommodations for them. Although there is presently little guidance in how far it will be necessary to go to overcome the burdens of the disabled, a health care provider would be wise to begin preparing now for the law's implementation.

The first action a physician should take is to reexamine his or her practice to assure that there are no actions taken with discriminatory intent. Next, the physician should attempt to identify all of the various types of disabling conditions likely to be encountered

in daily practice. For each type of disability, the physician should determine if there are any barriers that make access to services more difficult for a disabled person seeking care. Means of overcoming each of these barriers should then be sought, and the costs associated with these solutions should be determined. With this information, the physician will need to decide which accommodations should be implemented and which would pose an undue burden for financial or other reasons.

Throughout this process, the physician should document his or her actions. The more a physician can demonstrate that serious thought and planning went into decisions, the less likely it is that he or she will be vulnerable to charges of discrimination. While only time and experience (and court decisions) will confirm how far health care providers will have to go to comply with the new law, physicians should not wait for events to overtake them, but should take steps now to anticipate the law's effect. If ever called on to justify actions, the best defense is documentation that serious and thoughtful planning has been done.

# Where there's smoke...there may be bronchitis

"Recent research has delineated early, more subtle changes in lung and immune functions. These alterations directly predispose smokers to respiratory tract infection."

Am Fam Phys 1987;36:133-140

**Cecilor<sup>®</sup>**  
Pivules<sup>™</sup>  
250 mg  
**cefactor**

**Established therapy  
for today's patients**

For respiratory tract infections due to  
susceptible strains of indicated organisms

#### **Brief Summary.**

Consult the package literature for prescribing information.  
**Indication:** Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A  $\beta$ -hemolytic streptococci).

**Contraindication:** Known allergy to cephalosporins.  
**Warnings:** CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

#### **Precautions:**

- Discontinue Cefclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of non-susceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Cefclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Cefclor penetrates mother's milk. Exercise caution in prescribing for these patients.

#### **Adverse Reactions:** (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Hypersensitivity reactions have been reported in about 1.5% of patients and include morbilliform eruptions (1 in 100). Pruritus, urticaria, and positive Coombs' tests each occur in less than 1 in 200 patients. Cases of serum-sickness-like reactions have been reported with the use of Cefclor. These are characterized by findings of erythema multiforme, rashes, and other skin manifestations accompanied by arthritis/arthralgia, with or without fever, and differ from classic serum sickness in that there is infrequently associated lymphadenopathy and proteinuria, no circulating immune complexes, and no evidence to date of sequelae of the reaction. While further investigation is ongoing, serum-sickness-like reactions appear to be due to hypersensitivity and more often occur during or following a second (or subsequent) course of therapy with Cefclor. Such reactions have been reported more frequently in children than in adults with an overall occurrence ranging from 1 in 200 (0.5%) in one focused trial to 2 in 8,346 (0.024%) in overall clinical trials (with an incidence in children in clinical trials of 0.055%) to 1 in 38,000 (0.003%) in spontaneous event reports. Signs and symptoms usually occur a few days after initiation of therapy and subside within a few days after cessation of therapy; occasionally these reactions have resulted in hospitalization, usually of short duration (median hospitalization—two to three days, based on postmarketing surveillance studies). In those requiring hospitalization, the symptoms have ranged from mild to severe at the time of admission with more of the severe reactions occurring in children. Antihistamines and glucocorticoids appear to enhance resolution of the signs and symptoms. No serious sequelae have been reported.
- Stevens-Johnson syndrome, toxic epidermal necrolysis,

and anaphylaxis have been reported rarely. Anaphylaxis may be more common in patients with a history of penicillin allergy.

- Gastrointestinal (mostly diarrhea); 2.5%
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertension, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1% and, rarely, thrombocytopenia and reversible interstitial nephritis.

**Abnormalities in laboratory results of uncertain etiology.**

- Slight elevations in hepatic enzymes.
- Transient lymphocytosis, leukopenia, and, rarely, hemolytic anemia and reversible neutropenia.
- Rare reports of increased prothrombin time with or without clinical bleeding in patients receiving Cefclor and Coumadin concomitantly.
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinistix<sup>®</sup> tablets but not with Tes-Tape<sup>®</sup> (glucose enzymatic test strip, Lilly).

## The Legislative Process \*

---

### From Hopper to Enactment

The drafting of legislation requires the skill of experienced and trained personnel. This service is rendered by the Department of Legislative Reference. A bill or joint resolution may be introduced in advance of regular sessions and is styled a "prefiled bill." A bill is filed ("is dropped into the hopper") with the Secretary of the Senate or the Clerk of the House, is given a number, and is readied for its first reading on the floor. Bills may be introduced in either chamber until the last thirty-five days of the session. After that, bills may be introduced only with the consent of two-thirds of the membership.

**First Reading** The Reading Clerk, when the session has convened, reads the title and the presiding officer assigns the bill to the appropriate committee.

**Reference to Committee** The committees meet daily during the session to receive testimony and take action on bills assigned. Citizens are encouraged to present their views on the subject matter by mail or by personal appearance. Legislative agents (lobbyists), representing organized interest groups, speak at these hearings, either to oppose or support the proposed legislation. The Department of Fiscal Services prepares a fiscal analysis for each bill and these fiscal notes are considered during the committee deliberations.

Unfavorable committee action, which may mean legislative "death," frequently requires as much, or more, committee discussion and time as favorable committee action, which sends the bill to the floor for second reading and floor consideration.

**Second Reading and Floor Consideration** The bill is reported to the floor by the committee (favorably, unfavorably, or without recommendation, and with or without committee amendment). It is open to amendment from the floor, and the ultimate form of the bill must be determined on second reading. Committee action may be reversed but this is infrequent.

**Third Reading** The bill must be printed for third reading with all amendments included in this final version. No amendments may be presented on third reading in the chamber of its origin, and the bill must be passed by a majority of the elected membership.

**Second Chamber** The procedure follows a pattern identical with that of the chamber in which the bill originated, except amendments may be proposed during third reading as well as second reading. If not amended in the second chamber, final passage may occur without reprinting.

\*Information provided by the State of Maryland Department of Legislative Reference, F. Carvel Payne, Director.

---

## Consideration of Bills

---

### Consideration of Bills Originating in One Chamber and Amended in Second Chamber

If amended in the second chamber, the bill is returned to the chamber of origin where a vote is taken on a motion to concur or reject the amendments. If concurrence is voted, the bill itself is voted on as amended and action is complete. The bill is reprinted, or enrolled, to include the added amendments before submitting it to the Governor.

If the amendments are rejected, two courses of action are possible: 1) the amending chamber may be requested to withdraw its amendments, or 2) upon refusal of withdrawal of amendments, either chamber may request a conference committee to resolve the differences between the two chambers.

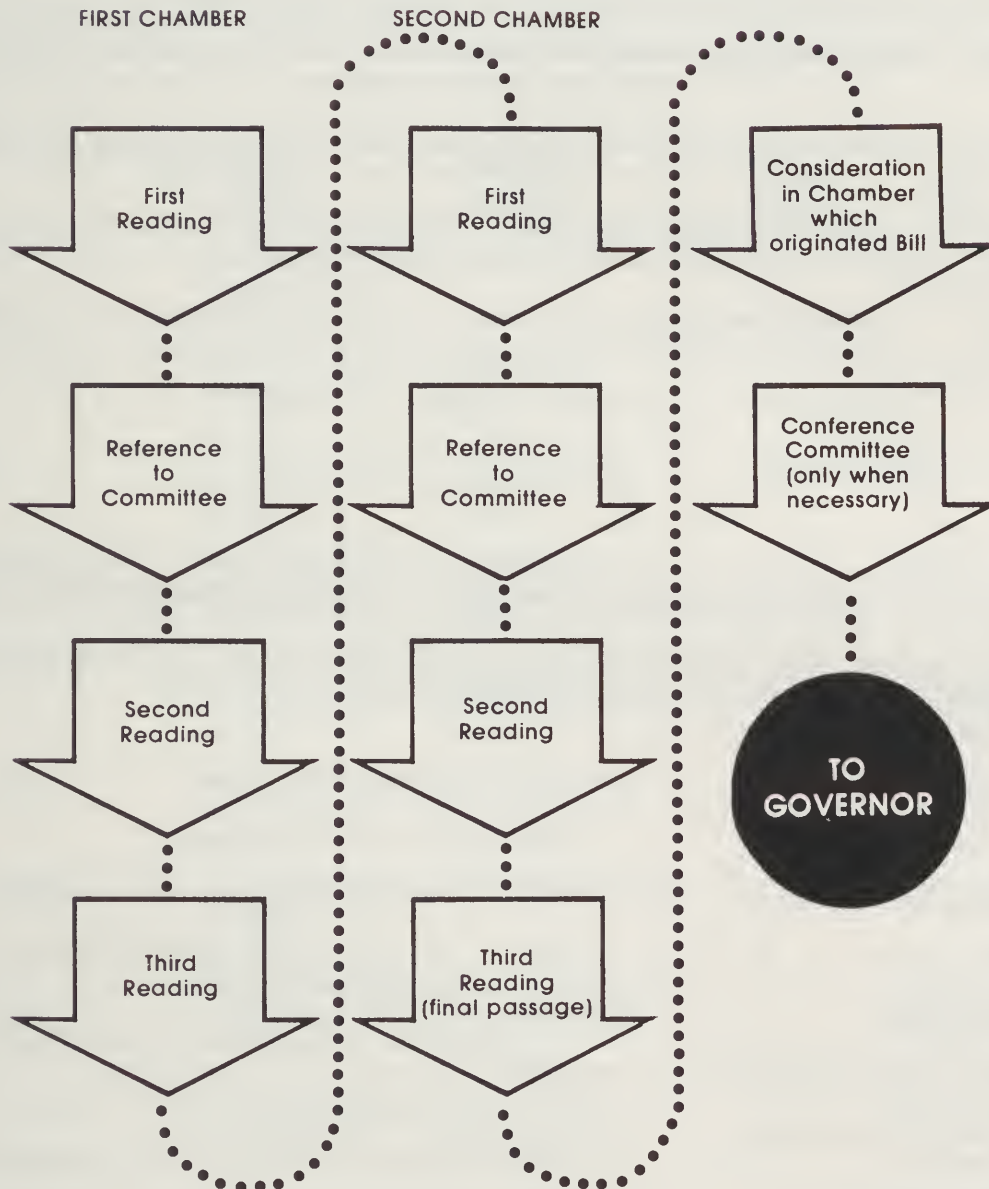

**Conference Committee** A report of a conference committee goes back to both chambers to be adopted or rejected without amendment. If the conference committee report is adopted, the bill is voted upon for final passage in each house. If the conference committee report is rejected by either house, the bill fails.

**Presentation of Bills to the Governor** Presentation of all bills, except the budget bill and constitutional amendments, to the Governor is mandatory. The budget bill becomes law upon its final passage and cannot be vetoed. Bills must be presented to the Governor within twenty days following adjournment of a session, and in the case of such bills, the Governor may veto within thirty days after presentation to him. If he does not veto a bill it becomes a law. He may not veto a constitutional amendment.

**The Power to Override a Veto** rests with the Legislature. If a bill is vetoed during a regular session, the veto message is considered immediately. If a bill presented after the session is vetoed, the veto message must be considered immediately at the next regular or special session of the Legislature, except that the Legislature during the first year of a new term may not override a veto. A three-fifths vote of the elected membership in each chamber is necessary to override a veto.

## The Progress of a Bill

---

## The 1991 Maryland General Assembly - Dates of Interest

---

January 9	Session convenes.
January 16	Budget must be submitted by Governor prior to this date.
January 22	Senate Bill and House Bill request guarantee date. (All bills filed by this date <i>must</i> be considered by committee.)
February 1	Senate Bill and House Bill introduction date. (Senate Bills introduced after this date are referred to the Senate Rules Committee.)
February 22	House Bills introduced after this date are referred to the House Rules Committee. (They are not guaranteed to have public committee hearings.)
March 19	Committee reporting courtesy date. Committees in each chamber should report out those bills they intend to pass favorably by this date.
March 25	Opposite chamber bill crossover date. The first chamber should pass those bills requiring consideration by the opposite chamber by this date.
April 1	Budget bill to be passed by both chambers by this date.
April 8	Adjournment.

# P.I.E.'s quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. P.I.E. Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

## **QRP FACTS:**

**Strict Underwriting Criteria** — Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

**Scheduled Premium Reductions** — Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

**High Limits** — Backed by our reinsurer, Lloyd's of London, P.I.E. is able to offer higher coverage limits for qualifying doctors: up to

\$7 million for individual doctors and \$13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

**Designed With Input from Doctors** — P.I.E.'s QRP plan is an innovative modified claims-made insurance specially designed with input from P.I.E.-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your P.I.E. representative, or our headquarters office today.

## Board of Physician Quality Assurance Actions

**In the Matter of  
Michael F. Corner, Physician Assistant  
Before the  
State Board of  
Physician Quality Assurance**

### Consent Order

Having reviewed certain information which came to its attention, the Board of Physician Quality Assurance (the Board), pursuant to its authority under *MD State Government Code Ann.* §10-405(b) (1989), on November 22, 1989, voted to summarily suspend the certification of Michael F. Corner PA (the Respondent), to practice as a physician assistant in the State of Maryland. The Order for Summary Suspension was executed on behalf of the Board by Israel H. Weiner MD, Chairperson of the Board, on November 29, 1989.

On February 28, 1990, the Board charged the Respondent pursuant to *MD Health Occ. Code Ann.* §14.5-312(3), specifically voting to charge the Respondent with a prohibited act under *MD Health Occ. Code Ann.* §14-504(b) (1989 Cum. Supp.). The pertinent provision of the Maryland Medical Practice Act (the Act) provides:

(b) Crimes involving moral turpitude.

- (1) Subject to the Administrative Procedure Act, the Board shall order the suspension of a license if the licensee is convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside.
- (2) After completion of the appellate process, if the conviction has not been reversed or the plea has not been set aside with respect to a crime involving moral turpitude, the Board shall order the revocation of a license subject to the hearing provisions of §14-505 of this subtitle.

The basis of the charge involved the results of an investigation conducted by the Baltimore City Police Department Sex Offense Unit into allegations of sexual abuse of a minor by the Respondent. As a result of this investigation, the Respondent was indicted by the Grand Jury for Baltimore City for the charge of third degree sexual offense. On December 12, 1989, the Respondent pled guilty to the charge of third degree sexual offense. Respondent was granted probation before judgment at sentencing on this same date.

On May 2, 1990, a Settlement Conference was held. As a result of negotiations during the Settlement Conference, the Respondent and the Board voted to accept the following Consent Order, which includes Findings of Fact, Conclusions of Law, and Order.

### Findings of Fact

1. At all times relevant hereto, Respondent was certified to practice as a physician assistant in the State of

Maryland. Respondent was indicted by the Grand Jury for Baltimore City on September 8, 1989 for the charge of third degree sexual offense.

2. On or about November 29, 1989, Respondent's State certification to practice as a physician assistant was summarily suspended by the Board as a result of an investigation by the Board into matters serving as the basis for the said indictment. A copy of the Order for Summary Suspension is attached hereto and is incorporated herein as Exhibit A.

3. On December 12, 1989, in the Circuit Court for Baltimore City, Respondent pled guilty to the aforementioned charges. Respondent was granted probation before judgment under Art. 27 §641 (1989 Cum. Supp.) of the *Annotated Code of Maryland*. Respondent was sentenced to a three-year period of supervised probation. As part of that probation, Respondent was ordered to perform seventy-five hours of community service, and to pay the court costs within thirty days.

4. A third degree sexual offense is a crime of moral turpitude.

### Conclusions of Law

Based on the foregoing Findings of Fact, the Board concludes that the Respondent has pled guilty to a crime of moral turpitude. Accordingly, the Board concludes as a matter of Law that the Respondent has violated §§14.5-312(3) and 14-504(b) of the Act.

### Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this twenty-second day of August 1990, by the Board, hereby:

ORDERED that pursuant to the authority vested in the Board by §14.5-312 of the Act, the Respondent's certification to practice as a physician assistant in the State of Maryland is hereby REVOKED; and be it further

ORDERED that on or after November 29, 1990, the Board will entertain a petition by Respondent for reinstatement of his certification to practice as a physician assistant, provided that Respondent, should he petition for reinstatement, complies with the following conditions:

1. The Respondent shall bear the burden of demonstrating, at the time of his petition for reinstatement before the Board, or upon a hearing granted thereto, that he is not a danger to the public;

2. The Respondent shall submit to a psychiatric evaluation by a Board-approved psychiatrist, as a condition precedent to the Respondent's petition for reinstatement, and shall agree, as part of his petition for reinstatement, to release to the Board copies of all

relevant psychiatric reports produced as a result of this evaluation, as the Board, in its discretion, requests;

3. The Respondent shall bear the costs associated with any psychiatric or other evaluations directed by the Board in fulfillment of the provisions of this Consent Order; and be it further

ORDERED that the Respondent shall agree that, should his certification to practice as a physician assistant be reinstated by the Board, the Respondent shall not treat any individuals under eighteen years of age in his capacity as a physician assistant; and be it further

ORDERED that the Board's Order for Summary Suspension, dated November 29, 1989, suspending Respondent's certification to practice as a physician assistant on an emergency basis, shall be and hereby is, immediately vacated upon the effective date of this Consent Order, that being the date on which the Board signs the Consent Order; and be it further

ORDERED that any public disclosure of the foregoing Consent Order shall consist of the contents of this CONSENT ORDER as permitted by *State Government Code Ann.* §10-617(h).

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

### Consent

I, Michael F. Corner PA, acknowledge that I am represented by Jack B. Rubin, Esquire, and I have had the opportunity to consult with counsel before entering into and signing this document. By this consent, I hereby admit the truth of the Findings of Fact, Conclusions of Law, and accept and submit to the foregoing Consent Order and its conditions, consisting of seven pages.

I acknowledge the validity of this Consent Order as if entered after the conclusion of a formal evidentiary hearing in which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my behalf, and to all other substantive and procedural protections provided by the laws of the State of Maryland. I acknowledge the legal authority and the jurisdiction of the Board to initiate these proceedings and to issue and enforce this Consent Order. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing.

By this consent, I acknowledge that my failure to abide by the conditions of the Consent Order may result in the Board's refusal to consider any reapplication for reinstatement of my certification to practice as a physician assistant.

I sign this Order after having an opportunity to consult with counsel, without reservation, and I fully understand and comprehend the language, meaning, and terms of this Consent Order.

MICHAEL F. CORNER

### Exhibit A

In the Matter of  
Michael F. Corner, Physician Assistant,  
Before the  
State Board of  
Physician Quality Assurance

#### Order of Summary Suspension of Certification to Practice as a Physician Assistant

The State Board of Physician Quality Assurance (the Board) herein sets forth the following background information as pertinent to this Order for Summary Suspension (the Emergency Suspension) with regard to the certification of Michael F. Corner, to practice as a physician assistant.

1. Respondent was and is presently certified to practice as a physician assistant in the State of Maryland.

2. On or about March 22, 1989, Subject A<sup>1</sup> reported an act of alleged sexual abuse involving Respondent and her nine-year old daughter, Subject B, to the State of Maryland Department of Social Services (DSS). DSS then referred the matter to the Baltimore City State's Attorney's Office (SAO).

3. On or about August 17, 1989, representatives of the SAO Sex Offense Unit interviewed Subject B, who stated that Respondent, whom Subject B identified as Subject A's boyfriend, on several occasions between January 1988 and June 1989, entered her bedroom and placed his hands between her legs on what Subject B referred to as her "private part" (denoting vagina).

4. On or about September 14, 1989, detectives of the Baltimore City Police Department interviewed Respondent in relation to these allegations. Respondent, after being advised of his Fifth Amendment rights against self-incrimination, and, after agreeing to waive those rights, admitted to nonconsensual, involuntary sexual contact with Subject B; and further admitted another instance of involuntary sexual contact with another young female while living in Indiana in 1974.

5. After the conclusion of this statement, Respondent was placed under arrest by detectives of the Baltimore City Police Department. Respondent was then indicted by the Grand Jury for Baltimore City on September 8, 1989 for the charge of third degree sexual offense. Said charges are scheduled for trial in Baltimore City Circuit Court on December 12, 1989, Part 2.

#### Findings of Fact

Based on the background information set forth above and the exhibits hereto, the Board has reason to believe that the following facts are true:

1. Respondent was and is presently certified to practice as a physician assistant in the State of Maryland.

2. On or about May/June 1986, Respondent was employed as a physician assistant by the Mount Royal Medical Center, Baltimore, MD. At that time, Respondent, in his capacity as a physician assistant, treated Subject A, a patient who sought medical attention at the Center.

3. Thereafter, Subject A sought employment as a secretary at a Mount Royal Medical Center branch facility, the Northwest Medical Center, Baltimore, MD. Respondent then transferred his place of employment to this facility, and then became involved in a continuing personal relationship with Subject A.

4. During the course of this personal relationship, Respondent cohabitated with Subject A and her children, among whom was her nine-year old daughter, Subject B.

5. On September 14, 1989, Respondent was interviewed by Detective Joan McEntyre of the Baltimore City Police Department in which Respondent, after being advised of his Fifth Amendment

1. Subject names are not used in the Summary Suspension. The Board maintains a list of subject names which corresponds to the alphabetical letter used in the Summary Suspension.

rights against self-incrimination, and after agreeing to waive those rights, admitted the following:

- (A) That during an eighteen-month period of time from early 1988 until the time of the statement, Respondent, while cohabitating with Subject A and her family, on eight to ten occasions engaged in nonconsensual, involuntary sexual conduct with nine-year old Subject B;
- (b) That the conduct occurred primarily in Subject B's bedroom when Respondent perceived Subject B to be asleep;
- (c) Respondent's contact consisted of "rubbing her back or stomach or something of that nature and also mak(ing) genital contact with my hand...";
- (d) That Respondent answered affirmatively when asked if he, Respondent, had fondled Subject B's vagina;
- (e) That Respondent engaged in similar nonconsensual, involuntary sexual conduct with another woman friend's daughter, while living in Indiana in 1974.

6. In his practice as a physician assistant, Respondent is certified to perform delegated medical acts under the supervision of a physician. These acts consist, but are not limited to, screening patients, performing physical examinations, performing developmental screening examinations on children, collecting specimens for laboratory tests, and performing clinical procedures involving close physical contact with patients. Respondent, in admitting to engaging in involuntary and nonconsensual sexual contact with at least two young females, poses a grave risk and imminent danger to the public health, safety, and welfare of the citizens of Maryland in that, in his capacity as a physician assistant, Respondent maintains the opportunity, through the delegated acts to which he is authorized to perform, to come into unsupervised, intimate physical contact with both children and adults.

#### Conclusions of Law

Based on the foregoing facts, the Board concludes that the public health, safety, and welfare imperatively require emergency action in this case pursuant to State Government Article §10-405(b), *Annotated Code of Maryland*.

#### Order

It is this twenty-ninth day of November 1989 by the State Board of Physician Quality Assurance:

ORDERED that pursuant to the authority vested in the Board by the State Government Article, §10-405 of the *Annotated Code of Maryland*, Respondent's State certification to practice as a physician assistant in the State of Maryland be and hereby is **SUMMARILY SUSPENDED**, and be it further

ORDERED that if a hearing is requested to consider this **SUMMARY SUSPENSION**, it shall be held before the Board at its next regularly scheduled meeting, Wednesday, December 13, 1989.

PLANNING FOR OUR CLIENTS FINANCIAL FUTURE

(Left to Right) Angelo J. Troisi, FACHE, Executive Director of Med Chi presents Delegate Joan Breslin Pitkin, Prince George's County Legislative District 23; and Prince George's County States Attorney Alexander Williams, Esq. with MAADA certificates.

### First Annual Drug Abuse Education Conference Was a Success

At the conference, "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician," held October 20-21, 1990 at the Baltimore Convention Center, Floyd Pond, Executive Director of the Governor's Drug and Alcohol Abuse Commission, presented the opening remarks. He extended greetings from Governor William Donald Schaefer and Lt. Governor Melvin A. Steinberg, expressing the Governor's appreciation for Med Chi's involvement in drug abuse education. Mr. Pond congratulated Med Chi physicians, stating that this program was "an excellent example of the initiative and commitment of Med Chi to educate primary care physicians and other health care professionals on drug abuse and should be used as a national model." In his concluding remarks, Mr. Pond discussed the work of the Commission which sets policies, establishes program priorities, and monitors and evaluates the State's substance abuse efforts. The Commission works with local governments as well as a variety of professional, service, fraternal, civic, and youth organizations around the State on the subject of substance abuse.

Delegates Joan B. Pitkin and Brian K. McHale were

among the 300 professionals who attended the weekend conference. Physicians, legislators, and health care professionals were offered information by fourteen different speakers on topics such as the epidemiology of drug abuse, the legal aspects of treating an addict, the recognition of the addict, and cocaine as it relates to AIDS and pregnancy.

This drug abuse education conference, which fulfilled twelve CME credits in Category I of the Physicians Recognition Award, was sponsored by the Med Chi Physician Rehabilitation Committee and the Committee on Drugs, in cooperation with the Med Chi Alliance Against Drug Abuse (MAADA) - MAADA is Med Chi's latest effort to unite civic and professional groups against the ever increasing problem of drug abuse in our society.

Professional audio tapes of the conference will be made available and will qualify for 12 CME credits in Category II of the Physicians Recognition Award. If you would like to receive the tapes, please call Vivian Smith, Public Relations Coordinator, at (301) 539-0872 or 1-800-492-1096. ■

J. Leonard Lichtenfeld MD, FACP

*J. Leonard Lichtenfeld MD, FACP*, an attending physician in the Department of Medicine at Sinai Hospital of Baltimore, was recently named to the Board of Trustees of the American Society of Internal Medicine (ASIM), an organization representing 24,000 internists throughout the United States.

A much published author, Dr. Lichtenfeld has been an active member of numerous Med Chi committees including Preventive Medicine and Public Health, Drugs, and Legislative, and was presented with the Med Chi Committee Chairman Recognition Award in 1988.

Currently Vice-president of the Maryland Society of Internal Medicine (MSIM), he received the MSIM's Internist of the Year Award in 1987.

Dr. Lichtenfeld is an Instructor in the Department of Medicine, Johns Hopkins University and hosts a twice-weekly radio show on health issues on WCBM (680 AM, Baltimore).

*Marvin B. Trotsky MD* was recently installed as President of the American Academy of Otolaryngic Allergy (AAOA), an organization for which he has served as

*Physicians' Quality Assurance Board Actions appear regularly in MMJ.*

Membership Chairperson, Co-chairperson for Resident Education, Board Examiner for Fellowship, and as a member of the Council.

An Affiliate Member of Med Chi, Dr. Trotsky is currently a Clinical Assistant Professor of Otolaryngology at Wayne State University College of Medicine. He has four publications to his credit and has presented numerous papers on allergies.

Charles J. Lancelotta MD

*Charles J. Lancelotta MD*, a board certified neurosurgeon, was recently elected Head of the Department of Surgery at Howard County General Hospital. He is the first non-general surgeon to be elected chairman of this ninety-five member department in the seventeen-year history of the hospital.

Dr. Lancelotta is a graduate of Loyola College (summa cum laude) and of the University of Maryland Medical School where he has remained active as a Clinical Assistant Professor of Neurosurgery.

A past president of the Howard County Medical Society, Dr. Lancelotta is currently secretary-treasurer of the Maryland Neurosurgery Society. ■

**MMJ** announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

## **LETTERS FROM THE EDITOR** LETTER

### **Rave Reviews for PPD**

**W**e are all well aware that physicians have a broad range of information needs. Since its inception, *MMJ* has made every effort to address the need for top quality clinical information among Maryland physicians. However, as Medicine and our lives have become more complex, we need an information source that addresses a variety of other topics, not all of which are directly related to Medical Science.

We are happy to announce that Med Chi's new publication, *Physician's Practice Digest (PPD)*, is that source.

*PPD's* first issue, sent to physicians this past fall, included articles on Medicare fraud and abuse, centralized credentialing, marketing, computerization, and financial planning. Comments from readers have been overwhelmingly positive, including:

*"Keep it up! I read this issue cover-to-cover and found (it) timely and very relevant..."*

*"If you continue the same quality magazine, you will have no trouble keeping my attention."*

*"I want to congratulate you, members of the Editorial Board and your staff on the publication...it is very attractive and full of pertinent and useful articles."*

*"...I am most impressed with Physician's Practice Digest. You have done an excellent job in your premiere issue. It is a quality magazine with an excellent focus."*

The second issue of *PPD* will be published this spring. It is our hope and the hope of the Editorial Boards of both *PPD* and *MMJ* that these two publications can work together in the future to insure that Med Chi can address all the information needs of its members.

To submit articles to *PPD*, write:

Executive Editor  
*PPD*  
1211 Cathedral Street  
Baltimore, MD 21201-5585

**MICHAEL R. DOBRIDGE MD**  
Editor, *PPD*

**VICTOR R. HREHOROVICH MD**  
Editor, *MMJ*

### **NOTICE TO AUTHORS** *Floppies Requested*

When submitting manuscripts for review by *MMJ's* Editorial Board, please send an IBM compatible floppy disk with the document entered in a Word Perfect, Multimate, or Wordstar program. At your request *MMJ* will return your disk after your article is published or if your manuscript is not accepted.

### Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

#### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degrees, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles.

Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both the principal author and **MMJ**.

\* \* \*

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

## The choices you make now may make all the difference later.

The decisions you make in a crisis will have a lasting impact on your patient's health. In the same way, the medical malpractice insurer you choose now may make all the difference to your professional and financial well-being in the years ahead.

When you choose Princeton, you're choosing a company with a solid track record. A company with years of experience providing professional liability insurance for physicians, and a history of successfully defending policyholders against meritless claims.

You're also choosing a company that's flexible enough to design policies that meet your individual coverage needs. Our innovative

*Occurrence Plus* policy, for example, combines the best features of standard occurrence and claims-made and offers you the broadest insurance protection available.

And coverage is only half the story. Princeton has seasoned specialists working on your behalf -- so service is prompt and professional. Plus, our team of risk management consultants is ready to answer your questions, or arrange on-site educational programs.

Whether it's your patient's future, or your own, that's on the line, making the right choices is critical. Choose the insurer that offers experience, flexibility and service. Choose Princeton. Call your independent insurance agent today.

# Our Members Are Not Dying For A Free Tail.

Strangely enough, some companies are trying to sell Maryland physicians a professional liability policy that requires them to die or become permanently disabled in order to get a free tail. At Medical Mutual, our members can get a free tail while they are very much alive.

We make the tail available at no extra cost for those of you who are planning to retire from the practice of medicine after five consecutive years on our claims made and/or occurrence policy. If retirement is not in your plans, our tail is free at any age after 15 consecutive years on our claims made policy. As an added feature, you may step down from a higher rated specialty to a lower rated one with no tail charge for making the change.

Your broker or our Member Services Representatives can answer your questions about tail provisions for Medical Mutual members.

Of course, we also give a free tail in the event of your permanent disability or death.

We just don't think this should be your only choice.

## Making the right choices means asking the right questions.

know the questions to ask your insurance agent. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical practice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you should consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which

questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

## Maryland Medical Journal

FEBRUARY 1991

VOLUME 40 NO 2

### ARTICLES

Dr. Handwerger's in-depth and thorough treatise on the utilization of blood tests in the diagnosis of connective tissue diseases offers an excellent preview of the March issue which will focus on the Department of Medicine of the University of Maryland School of Medicine.

#### **Blood Tests in the Diagnosis of Connective Tissue Diseases . . . . . 97**

*Barry S. Handwerger MD*

Obtaining a complete rheumatological and medical history, performing a thorough physical examination, and carefully evaluating the laboratory data are all absolutely essential in making a diagnosis of connective tissue disease.

#### **Maryland's Cytology Labs: 1989-90 Proficiency Testing Results . . . . . 107**

*John M. DeBoy DrPH and Barbara R. Jarboe CT (ASCP, IAC)*

In 1990, the Department of Health and Mental Hygiene provided proficiency testing to 73 cytology laboratories, and 293 technical employees. Sixty-three of these labs, 132 of 154 pathologists, and 130 of 139 cytotechnologists passed without having to undergo retesting or retraining. Failing laboratories accounted for approximately 2 percent of the cervicovaginal slides diagnosed in 1989. Labs with the lowest passing rates were small ones operated by single pathologists not employing cytotechnologists. Eight pathologists either surrendered their state permit or were required to obtain additional training; no cytotechnologist required additional training.

#### **Magnetic Resonance Imaging Diagnosis of an Intracranial Metastasis of Adenocarcinoma of the Prostate: Case Report . . . . . 113**

*Paul R. Capito MD, Henry Wang MD, Henry Brem MD, Hyo S. Ahn MD, and R. Nick Bryan MD, PhD*

Adenocarcinoma of the prostate is the second most common cancer of American males over age 50. However, the reported instances of cerebral metastases have been exceedingly rare and are usually diagnosed at postmortem. This report describes an unusual case of brain metastasis from an occult adenocarcinoma of the prostate confirmed by craniotomy and tumor resection.

# Our Pictures Are Worth A Thousand Words.™

## Case #13

69 year old female complaining of severe pain in the neck and both arms with no known past medical problems.

**DIAGNOSIS: EPIDURAL METASTATIC MASS originating from the C7 vertebral body protruding into the spinal canal and compressing the spinal cord.**

The sagittal T1 and T2 weighted images in this elderly patient demonstrate spondylosis and exaggerated spinal curvature. Both images demonstrate abnormal signal within the C2, C3, C4 and C7 vertebral bodies (decreased on T1 and increased on T2). A soft tissue mass, contiguous with the C7 vertebral body, protrudes posteriorly into the spinal canal, effacing the subarachnoid space and causing definite compression of the spinal cord. Spinal cord compression is easily demonstrated by sagittal and axial MRI. In many cases, the etiology can be differentiated as to herniated disc, spondylotic bar, metastatic disease, lymphoma, etc. In this particular patient there is further compromise of the spinal canal by spondylotic hypertrophy of the facets at the C7-T1 level.

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and weekend hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

**You work hard to gain your patients' trust and confidence. At Drs. Copeland, Hyman & Shackman, we'll help you keep it.**

### Gastroenteritis: Causative Pathogens, Specimen Collection and, Traveler's Diarrhea

The following information is abstracted from Recommendations for Collection of Laboratory Specimens Associated with Outbreaks of Gastroenteritis (MMWR 1990; 39[No RR-14]:1-12).

#### I. Pathogens of Diarrhea

##### A. Viruses

Table 1 summarizes information relevant to outbreaks of viral gastroenteritis. Non-bloody diarrhea is frequently seen and vomiting, fever, and abdominal cramps are also common symptoms. All are most likely spread by fecal-oral transmission, usually person-to-person but sometimes through food or

**TABLE 1. Information relevant to outbreaks of viral gastroenteritis**

Causative agent	Patient age groupings	Selected symptoms*		Incubation period	Duration of illness	Mode of transmission
		Vomiting	Fever			
Astrovirus	young children and elderly people	occasional	occasional	1-4 days	2-3 days; occasionally 1-14 days	food, water, fecal-oral
Calicivirus	infants, young children, and adults	common for infants; variable for adults	occasional	1-3 days	1-3 days	food, water, nosocomial, fecal-oral
Enteric adenovirus	young children	common	common	7-8 days	8-12 days	nosocomial, fecal-oral
Norwalk virus	older children and adults	common	rare or mild	18-48 hours	12-48 hours	food, water, PTP, <sup>†</sup> ?air, fecal-oral
Rotavirus, group A	infants and toddlers	common	common	1-3 days	5-7 days	water, PTP, ?food, ?air, nosocomial, fecal-oral
Rotavirus, group B	children and adults	variable	rare	56 hours (average)	3-7 days	water, PTP, fecal-oral
Rotavirus, group C	infants, children, and adults	unknown	unknown	24-48 hours	3-7 days	fecal-oral

\*Diarrhea is common and is usually loose, watery, and non-bloody when associated with gastroenteritis.

<sup>†</sup>PTP = person-to-person.

? = not confirmed.

water. Incubation periods are characteristically short (1-2 days) except for enteric adenovirus which can have an incubation period of 7-8 days. Most patients shed these viruses in the greatest amounts during the acute phase of illness and up to 48-72 hours post recovery.

## B. Bacteria

Many different bacteria cause outbreaks of diarrhea (Table 2). The cause of illness can be hypothesized based on the symptoms and their severity, the suspected incubation period and the duration of illness. A patient may name a possible source that is incompatible with the symptoms and incubation period. Only by interviewing the patient in

detail about all exposures to food, others with similar illness, pets, travel, etc. for an entire incubation period can possible source(s) be determined.

The recent identification of new strains of *Escherichia coli* suggests that this pathogen may be a more important cause of diarrheal illness than was previously recognized. Diarrheagenic *E. coli* are currently categorized into four groups: enterotoxigenic, enteropathogenic, enteroinvasive and enterohemorrhagic *E. coli* (EHEC). EHEC (of which *E. coli* O157:H7 is the prototype) is frequently reported in this country. *E. coli* O157:H7 is now known to be the major cause of hemolytic uremic syndrome in the US.

TABLE 2. Information relevant to outbreaks of bacterial gastroenteritis

Causative agent	Patient age groupings	Selected symptoms			Incubation period	Duration of illness	Mode of transmission
		Vomiting	Fever	Diarrhea			
<i>Bacillus cereus</i> and <i>Staphylococcus aureus</i>	all	common	rare	usually not prominent	1-6 hours	<24 hours	food
<i>Campylobacter jejuni</i>	all groups, especially <1 year old and young adults	variable	variable	may be dysenteric	3-5 days (1-7 days)	1-4 days, occasionally >10 days	food, water, pets, fecal-oral
Enterotoxigenic <i>Escherichia coli</i>	adults, infants, children	occasional	variable	watery to profuse watery	12-72 hours	3-5 days	food, water, PTP,* fecal-oral
Enteropathogenic <i>Escherichia coli</i>	infants	variable	variable	watery to profuse watery	2-6 days	1-3 weeks	food, water, PTP, fecal-oral
Enteroinvasive <i>Escherichia coli</i>	adults	occasional	common	may be dysenteric	2-3 days	1-2 weeks	food, water, PTP, fecal-oral
Enterohemorrhagic <i>Escherichia coli</i>	<10 years (50%), 15 months-73 years	common	rare or mild	first watery, then grossly bloody	3-5 days	7-10 days (1-12 days)	food, PTP, fecal-oral
<i>Salmonella</i>	all groups, especially infants and young children	occasional	common	loose, watery, occasionally bloody	8-48 hours	3-5 days	food, water, fecal-oral
<i>Shigella</i>	all groups, especially 6 months-10 years	occasional	common	may be dysenteric	1-7 days	4-7 days	food, water, PTP, fecal-oral
<i>Yersinia enterocolitica</i>	all groups, especially older children and young adults	occasional	common	mucoid, occasionally bloody	2-7 days	1 day-3 weeks (average 9 days)	food, water, PTP, pets, fecal-oral
<i>Vibrio cholerae</i>	all groups	common	variable	may be profuse and watery	9-72 hours	3-4 days	fecal-oral, food, water

\*PTP = person-to-person.

Cattle appear to be a common reservoir for this organism.

### C. Parasites

In general, the incubation period, duration of illness, and period of pathogen excretion are usually longer in association with diarrheal infection caused by parasites than with diarrhea caused by viruses or bacteria.

Table 3 shows information relevant to parasites that commonly cause gastroenteritis.

## II. Specimen Collection

### Diarrhea in Travelers

The following information is a summary of an article by Timothy Holtz, M.P.H., and Mary D. Nettleman, M.D.: "Emporiatrics: Diarrhea in Travelers" which appeared in *Infection Control and Hospital Epidemiology* 1990;11:606-610.

#### Epidemiology:

The attack rate for short-term travelers is 30-40%--more frequent in neophytes to international travel, young adults, those traveling under primitive conditions, and those with prior gastrointestinal disorders.

#### Etiology:

No pathogen has been identified in 50-70% of cases. Of the known pathogens, bacteria are most frequent. Mixed infection is common. Pathogens include *E. coli*, *Salmonella*, *Shigella*, *Campylobacter*, *Vibrio*, *Aeromonas hydrophila*, *Plesiomonas*, rotavirus, and other viruses. *Entamoeba histolytica*, *Giardia*, and other parasites including helminths are possible. Non-infectious causes are also possible.

#### Symptoms:

In addition to diarrhea, symptoms include, cramps (73%), vomiting (18%), and fever (15%). An average of 4.6 stools/day are experienced by persons with diarrhea; 11% show blood in their stool.

#### Precautions:

Although the majority of travelers will have only a few days of symptoms and then recover completely, travelers should follow food and

Table 4 shows general information for collection of stool specimens. These instructions were primarily intended for public health agencies that collaborate with the Centers for Disease Control in investigating outbreaks of gastroenteritis and, therefore, the number of specimens to collect and the type of collection medium may vary for the individual practitioner. Please consult with your reference laboratory for the tests available, and the type of specimens required. Report confirmed or suspected outbreaks to your local health department.

water precautions below. In general, "boil it, cook it, peel it, or forget it:"

- \* **AVOID** tap water, food washed with tap water, food at room temperature, uncarbonated bottled water, ice, leafy vegetables and salads, fruits that can't be peeled, dairy products, sandwiches with mixed fillings, sauces, dressings, raw oysters, and undercooked meat and seafood.

#### Treatment and prophylaxis:

Strong consideration should be given to allowing the adult traveler to carry antibiotics with instructions to **begin taking if diarrhea occurs:**

- \* trimethoprim/sulfamethoxazole (160/800 mg twice daily for 3 days), or
- \* ciprofloxacin (500 mg twice daily for 5 days), or
- \* norfloxacin (400 mg twice daily for 3 days), and

also start an antimotility agent (such as loperamide).

Patients with bloody diarrhea, severe abdominal pain, shaking chills, or significant fever, or when diarrhea lasts more than 3 days or results in dehydration, however, should seek medical attention.

**Prophylaxis** has been shown to effectively prevent traveler's diarrhea but might be reserved for the traveler who will stay only a few days and to whom even a few hours of diarrhea might be extremely disadvantageous.

TABLE 3. Information relevant to outbreaks of parasitic gastroenteritis

Causative agent	Patient age groupings	Selected symptoms			Incubation period	Duration of illness	Mode of transmission
		Fever	Diarrhea	Abdominal			
<i>Balantidium coli</i>	unknown	rare	occasional mucous or blood	mild to severe pain	unknown	unknown	food, water, fecal-oral
<i>Cryptosporidium</i>	children, adults with AIDS	occasional	profuse, watery	occasional cramping	1-2 weeks	4 days-3 weeks	food, water, PTP,* pets, fecal-oral
<i>Entamoeba histolytica</i>	all groups, adults	variable	occasional mucous or blood	colicky pain	2-4 weeks	weeks-months	food, water, fecal-oral
<i>Giardia lamblia</i>	all groups, children	rare	loose, pale, greasy stools	cramps, bloating, flatulence	5-25 days	1-2 weeks to months and years	food, water, fecal-oral
<i>Isospora belli</i>	adults with AIDS	unknown	loose stools	unknown	9-15 days	2-3 weeks	fecal-oral

\*PTP = person-to-person.

TABLE 4. General instructions for collection of stool specimens

Instructions for collecting specimens	Type of agent to be tested for		
	Virus	Bacterium	Parasite
When to collect	Within 48-72 hours after onset of illness.	During period of active diarrhea (preferably as soon after onset of illness as possible).	Any time after onset of illness (preferably as soon after onset of illness as possible).
How much to collect	As much stool sample from each of 10 ill persons as possible (at least 10 cc each person); samples from 10 controls may also be submitted.	Two rectal swabs or swabs of fresh stool from each of 10 ill persons; samples from 10 controls may also be submitted.	A fresh stool sample from each of 10 ill persons; samples from 10 controls may also be submitted.
Method of collection	Place fresh stool specimens (liquid preferable), unmixed with urine, in clean, dry containers, (e.g., urine specimen cups).	For rectal swabs, moisten each of two swabs in Cary-Blair medium first, then insert sequentially 1-1.5 inches in rectum and gently rotate. Place both swabs into the same Cary-Blair medium tube. Break off top portions of swab sticks and discard.	Collect a bulk stool specimen, unmixed with urine, in a clean container. Place a portion of each stool sample into 10% formalin and polyvinyl alcohol preservatives at a ratio of 1 part stool to 3 parts preservative. Mix well.
Storage of specimen after collection	Immediately refrigerate at 4 C. DO NOT FREEZE if electron microscopy is anticipated.	Immediately refrigerate at 4 C if testing is to be done within 48 hours after collection; otherwise, freeze samples at -70 C.	Store at room temperature, or refrigerate at 4 C. DO NOT FREEZE.
Transportation	Keep refrigerated. Place bagged and sealed specimens on ice or with frozen refrigerant packs in an insulated box. Send by overnight mail. DO NOT FREEZE.	Refrigerate as directed for viral specimens. For frozen samples: place bagged and sealed samples on dry ice. Mail in insulated box by overnight mail.	Refrigerate as directed for viral specimens. For room-temperature samples: mail in water-proof containers. DO NOT FREEZE.

# A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

# Where there's smoke...there may be bronchitis

"Recent research has delineated early, more subtle changes in lung and immune functions. These alterations directly predispose smokers to respiratory tract infection."

*Am Fam Phys* 1987;36:133-140

**Ceclor**<sup>®</sup>  
Pulvules<sup>®</sup> 250 mg  
**cefactor**

**Established therapy  
for today's patients**

For respiratory tract infections due to  
susceptible strains of indicated organisms

#### Brief Summary.

Consult the package literature for prescribing information.  
**Indication:** Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A  $\beta$ -hemolytic streptococci).

**Contraindication:** Known allergy to cephalosporins.  
**Warnings:** CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

#### Precautions:

- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of non-susceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

#### Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Hypersensitivity reactions have been reported in about 1.5% of patients and include morbilliform eruptions (1 in 100). Pruritus, urticaria, and positive Coombs' tests each occur in less than 1 in 200 patients. Cases of serum-sickness-like reactions have been reported with the use of Ceclor. These are characterized by findings of erythema multiforme, rashes, and other skin manifestations accompanied by arthritis/arthralgia, with or without fever, and differ from classic serum sickness in that there is infrequently associated lymphadenopathy and proteinuria, no circulating immune complexes, and no evidence to date of sequelae of the reaction. While further investigation is ongoing, serum-sickness-like reactions appear to be due to hypersensitivity and more often occur during or following a second (or subsequent) course of therapy with Ceclor. Such reactions have been reported more frequently in children than in adults with an overall occurrence ranging from 1 in 200 (0.5%) in one focused trial to 2 in 8,346 (0.024%) in overall clinical trials (with an incidence in children in clinical trials of 0.055%) to 1 in 38,000 (0.003%) in spontaneous event reports. Signs and symptoms usually occur a few days after initiation of therapy and subside within a few days after cessation of therapy; occasionally these reactions have resulted in hospitalization, usually of short duration (median hospitalization = two to three days, based on postmarketing surveillance studies). In those requiring hospitalization, the symptoms have ranged from mild to severe at the time of admission with more of the severe reactions occurring in children. Antihistamines and glucocorticoids appear to enhance resolution of the signs and symptoms. No serious sequelae have been reported.
- Stevens-Johnson syndrome, toxic epidermal necrolysis,

and anaphylaxis have been reported rarely. Anaphylaxis may be more common in patients with a history of penicillin allergy.

- Gastrointestinal (mostly diarrhea): 2.5%
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonía, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1% and, rarely, thrombocytopenia and reversible interstitial nephritis.

#### Abnormalities in laboratory results of uncertain etiology:

- Slight elevations in hepatic enzymes.
- Transient lymphocytosis, leukopenia, and, rarely, hemolytic anemia and reversible neutropenia.
- Rare reports of increased prothrombin time with or without clinical bleeding in patients receiving Ceclor and Coumadin concomitantly.
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinistest<sup>®</sup> tablets but not with Tes-Tape<sup>®</sup> (glucose enzymatic test strip, Lilly).

## Conservative Treatment of Adenocarcinoma of the Lower Rectum

It is estimated that 45,000 new cases of adenocarcinoma of the rectum are diagnosed in the U.S. each year, and that almost 17,500 will be initially diagnosed as stage I (inside the bowel wall) or stage II disease (through the bowel wall). Although early detection carries better survival, many patients are fearful of surgical management because of the associated morbidity and mortality. Most of these carcinomas, especially of the middle and lower rectum, require abdominoperineal resection (APR) with permanent colostomy, an operation that carries a mortality rate of about 4 percent. In addition, this operation is associated with a 5 to 20 percent rate of impotence and urologic dysfunction. The overall local failure rate of APR for all stages of the disease can be as high as 32 percent.<sup>1</sup>

While several studies are being conducted to lower local recurrences and improve the survival of patients with Dukes' B (Astler Collier B<sub>2</sub>) and C, i.e., stage II and III disease, others are considering conservative approaches to eliminate the need for APR in selected cases, especially in patients with Dukes' A (Astler Collier's A+B<sub>1</sub>), i.e., stage I. Four such conservative methods have been used; some are not new and can be traced back over five decades. The experiences thus far have been encouraging and have demonstrated that certain rectal cancers can be conservatively managed in selected situations.<sup>2</sup>

**Fulguration and Electrocoagulation:** These methods destroy the tumor locally either by heat from a probe inserted into the tumor or by a sparking wire loop that cauterizes the tumor by layers. While several reports claim satisfactory results in selected cases, several disadvantages must be noted. These include imprecise control of the tissues destroyed and lack of pathological assessment of tumor invasion. Without such prognostic information, comparison with other surgical methods is impossible. Furthermore, moderate to severe complications, particularly rectal bleeding, have occurred in 8 to 28 percent of the patients so treated, with local recurrence rates of 12 to 60 percent.<sup>3-7</sup>

**Laser Therapy:** This approach will probably give results similar to those of electrocoagulation. It has controlled low grade of penetration and fulguration which makes it safe to utilize, not only in rectal cancers, but also in colonic lesions.

**Endocavitary Radiation:** During the last decade, endocavitary radiation has become an acceptable method of therapy for clinically T<sub>1</sub> and T<sub>2</sub> lesions (Dukes' A and B<sub>1</sub>). There is minimal morbidity and the procedure is performed on an outpatient basis. Papillon reported an absolute five-year survival rate of 78 percent<sup>8</sup> without recurrence. Again, such an approach does not allow for exact pathological staging of the disease, and makes evaluation of the results difficult.

**Local Surgical Excision:** Local excision of rectal carcinoma via a transanal approach in selected groups of patients has resulted in five-year survival rates ranging from 78 to 89 percent.<sup>9-15</sup> This survival is comparable to results achieved with radical surgery for a similar stage of the disease.<sup>16</sup> The size, pattern of growth, and cell differentiation of the primary tumor are important criteria for patient selection.<sup>17</sup> Exophytic, well-differentiated lesions less than 4 cm in diameter were shown to have a 12.5 percent incidence of positive perirectal lymph node involvement. On the other hand, ulcerated, invasive, well-differentiated lesions less than 4 cm had a 50 percent incidence of positive regional lymph nodes. Exophytic, moderately-differentiated lesions less than 4 cm in diameter had a 20 to 27 percent incidence of regional lymph node metastases; this is similar to the 21 percent local recurrence rate reported in selected patients treated by local excisions.<sup>2</sup>

**Local Excision and Postoperative Radiotherapy:** The success of conservative management of rectal cancers requires skilled clinical selection of patients with T<sub>1</sub> or T<sub>2</sub> lesions so that it can result in local control similar to that of radical surgery. The use of 5000 rads (50 Gy) of external beam radiotherapy after local excision of the rectal lesion has improved local control in such patients.<sup>18</sup> In seventeen patients who had their gross tumor removed (65 percent had positive margins and of these, 35 percent had positive deep margins) and received postoperative external irradiation, only one developed local recurrence for an incidence rate of 6 percent. To further improve these results, the addition of chemotherapy to postoperative irradiation has resulted in better local control and survival.<sup>19,20</sup> Furthermore, it has been shown that local failure can successfully be salvaged by radical resection,<sup>2</sup> and that pelvic nodal resections after radiation therapy are not complicated in previously undissected tissues.<sup>21</sup>

The Surgical Oncology Program and the University of Maryland Cancer Center have been involved in a national study for conservative treatment of adenocarcinoma of the distal rectum (CALGB 8984). Patients with T<sub>1</sub> or T<sub>2</sub> tumors located within 10 cm above the dentate line are candidates for such management. They will undergo computerized tomography scan and transrectal ultrasound scan of the pelvis which may add further objective information for the staging of their disease. The lesions will then be locally resected via a transanal approach. Those who are found to have positive margins will undergo radical resections. Those who are found to have negative margins will receive 50 Gy/28 fraction, and 5-Fluorouracil 500 mgm/m<sup>2</sup> on days one to three and twenty-nine to thirty-one. This is to be initiated within two weeks of the date of resection. Furthermore, the tumor will be

studied by flow cytometry and for DNA (S-phase) characteristics. All such data will be correlated to the survival.

# *Catastrophic Illness is Rare and the Treatment is Critical.*

You know the patient. The one with chronic psychosis that hasn't responded to general inpatient care. The patient has comprehensive coverage so you've been able to admit him time and time again for inpatient care. But there's been little if any improvement, and you're frustrated. It's time to refer him to a hospital that is committed to treating the long term refractory patient and has the resources to do it. Sheppard Pratt.

Today's literature discourages long term hospitalization, and we agree. That same literature does, however acknowledge that a small group of chronic patients cannot be treated any other way. In 1984, Sheppard Pratt opened an 18 bed unit that treats only those types of patients.

We are not talking about custodial care nor do we treat patients who spend years talking about delusions. We provide long term, active, behavioral, psychopharmacological treatment for those patients who can genuinely be helped.

In addition to managing systematic and aggressive medication trials, our patients live within an established token economy. Patient education and social skills programming, and specialized activity therapy are provided daily throughout treatment. Formalized psychoeducation is also a vital component of treatment and family involvement. Comprehensive discharge planning is given attention equal to inpatient care. Sheppard Pratt provides many options for aftercare including a quarterway house, supervised housing, vocational training, outpatient therapy and medications management, and day hospitals.

Sheppard Pratt is a comprehensive network of psychiatric services. In addition to our 322 bed hospital we maintain the 16 bed Mt. Airy House, numerous community outreach programs and the National Center for Human Development. For more than 100 years, Sheppard Pratt has earned its reputation for providing quality care to the chronically ill patient. And during these difficult economic times, we remain loyal to that heritage.

For further information or to make a referral contact the Adult Admissions Office at:

effectively meet your needs as a Maryland physician, Med Chi must maintain an extensive framework of committees to uphold prior commitments, manage current programs, and formulate new policy. It is essential that these committees be comprised of interested members so that Med Chi will remain a strong, viable, and active organization.

Please indicate your willingness to serve by checking your committee preference and special interests on the reply card. Every effort will be made to appoint you to the committee of your choice.

We intend to appoint as many members as possible to committees to ensure Med Chi's continued growth as a leading voice for medicine in Maryland.

Thank you for your support.  
J. David Nagel MD  
President-elect

1991-1992  
Committee Selection  
Cards Attached

---

## Committee Selection Cards

---

Med Chi members interested in serving on a Med Chi committee during 1991-1992 should complete the committee selection card following this newsletter. All members should complete this card by March 31, 1991 in order to be considered for appointment to a Med Chi committee.

---

## 1991 Annual Meeting

---

"American Medicine Today, Perspectives from Maryland" is the theme for Med Chi's 193rd Annual Meeting to be held on Wednesday, May 8 thru Saturday, May 11, 1991 at the University of Maryland Center of Adult Education in College Park, Maryland. AMA President John C. Tupper MD has accepted Med Chi's invitation and will address the House of Delegates on May 8th. Med Chi has also invited Mrs. Marilyn Quayle and Senator John D. Rockefeller, IV (D-WV) to speak during the meeting. Mark your calendar, send in the pre-registration form sent with the January MMJ and watch future issues of the *Maryland Medical Journal* for more details about the meeting. To pre-register by phone or for additional information, call Michael Moran at 301-539-0872 or 1-800-492-1056.

---

## 1991 Med Chi Directory

---

Due to a computer error, the names of physicians from Montgomery and Worcester counties were inadvertently omitted from the combined alphabetical index to the 1991-1992 *Med Chi Membership Directory*. Med Chi has arranged with the printer to publish a corrected index for the *Directory* which will be distributed with a future issue of the MMJ. Other corrections to the *Directory* will be published along with the index. To update your *Directory* listing or to order an additional copy contact Wanda Griebel in the Finance Department at 301-539-0872 or 1-800-492-1056.

---

## Radiation Technologists Regulations

---

Emergency regulations governing radiation technologists and nuclear medical technologists became effective February 16, 1990, requiring physicians to use certified technologists for x-rays and other diagnostic and treatment procedures. The emergency regulations are a temporary measure to allow the State time to draft permanent regulations. The permanent version of these regulations have not been promulgated by the Board of Physician Quality Assurance (BPQA), and Med Chi has an opportunity to provide input before that occurs.

Since the emergency regulations went into effect, Med Chi has received numerous questions and comments from physicians regarding these regulations and their impact on private office practices. Most physicians are concerned that they may have to employ a certified radiation technologist to perform a relatively small number of routine procedures. The resulting cost could be a significant burden to small practices, especially those in rural areas.

When the Maryland General Assembly enacted legislation providing for the certification of radiation and nuclear medical technologists, it delegated to the BPQA the authority and responsibility for defining what constitutes the practice of "medical radiation technology" and "nuclear medical technology." The legislature also delegated responsibility for defining the qualifications for individuals to practice in this area.

After discussion with representatives of the BPQA, it has been determined

that revisions to these regulations may be appropriate. To assure that these procedures are conducted safely and effectively, Med Chi is proposing that these procedures be performed in accordance with procedures established by a supervising physician and by individuals who have undergone a course of instruction relevant to the specific procedures and who receive periodic proficiency testing.

Med Chi is drafting language for the Board's consideration that would exempt specific procedures from the requirement that a certified technologist be employed. To assist in this process, Med Chi has requested that each component and specialty society consult its members and provide input on what procedures could be performed safely and effectively without the use of certified technologists. Anyone wishing to submit information or to serve on an ad hoc committee, please call or write Stephen C. Buckingham, Esq., legal counsel for Med Chi, at 1211 Cathedral Street, Baltimore, MD 21201-5585, 301-539-0872 or 1-800-492-1056.

---

## *Maryland Medical Assistance Program Updates*

---

### *"Brand Medically Necessary" Prescriptions*

Effective November 26, 1990, the Maryland Medical Assistance Program no longer reimburses for "brand medically necessary" invoices submitted by tape. Only hard copy invoices are accepted for original and refill prescriptions for Medical Assistance and Pharmacy Assistance recipients. The specification of "brand medically necessary" and the justification for its use must be written on the original invoice form in the prescriber's own handwriting. Verification copies are not required to be submitted to the Medical Assistance Compliance Administration for services rendered on or after November 26, 1990.

### *Hospice*

Under the regulations for Hospice Care (COMAR 10.09.35), a terminally ill Medical Assistance recipient may, under certain conditions, elect to become a hospice care enrollee in lieu of receiving regular Medical Assistance benefits. An eligible recipient, who elects hospice care, must obtain services for conditions related to the terminal illness directly from, or under arrangements by, a designated hospice care provider and the physician identified as the recipient's attending physician at the time of election of hospice care. The hospice care provider will act as the care manager for the recipient and reimbursement for services will not be available without clearance from the hospice care provider. Recipients enrolled in the Hospice Care Program will receive a special blue-and-white identification card with the notation "HOSPICE CARE." The Eligibility Verification System (EVS) message will state the customary eligibility information and add "but restricted" when the recipient is enrolled in hospice care. For further information about the program or providing services not related to the recipient's terminal illness, contact the DHMH Managed Care Program (Hospice Care Program) at 301-225-1678 (M-F, 8:30 AM - 4:30 PM).

---

## *MPA Advisement*

---

The Maryland Pharmacists Association (MPA) recently advised Med Chi that staff pharmacists for Medco, the country's largest mail-order prescription house, will be calling physicians to request they prescribe one particular drug over another. This initiative may not be based on better care for the patient but rather may be business-oriented.

Many third-party prescription programs are now asking pharmacists to work with prescribers to optimize the cost-effectiveness of therapy. In some cases, pharmacists may need to request a change in product selec-

tion in order to meet the requirements of the patient's insurance company or HMO. The MPA encourages pharmacists who have full medication profiles to contact physicians when they believe the patient should be getting a different or less expensive drug.

---

## *RBRVS Update*

---

Phase II of the Resource-Based Relative Value Scale (RBRVS) for physician services went to the Health Care Financing Administration (HCFA). Under Phase II, the Harvard study group added 15 additional specialties; cardiology, emergency medicine, gastroenterology, hematology, oncology, infectious disease, nephrology, neurology, neurosurgery, nuclear medicine, osteopathic medicine, physical and rehabilitative medicine, plastic surgery, pulmonary medicine, and therapeutic radiology. Three Phase I specialties (internal medicine, general surgery and orthopedic surgery) were resurveyed and refined. Furthermore, Phase II expands the number of procedures for which Harvard has compiled relative values to 2,700 procedure codes which cover 95 percent of Medicare charges (Phase I had relative values for 1,400 procedures).

In Phase III of the study, pre- and post-work associated with some difficult surgical cases will be further studied along with diagnostic tests and certain packages of care (e.g., kidney dialysis patients).

---

## *MMR Vaccine*

---

Based on a recommendation by the Subcommittee on Immunization and Infectious Diseases, Med Chi recently adopted the position that a second dose of the MMR Vaccine be given to all children age 12 with the option to give the vaccine to younger children ages 4-6.

Med Chi also recommends that the Haemophilus b Conjugate Vaccine distributed by Lederle Laboratories as HibTITER, be given as follows:

2-6 mos. 4 doses (2, 4 & 6 mos.; booster at 15 mos.)

7-11 mos. 3 doses, at least 1 month apart, booster at 15 months (can be incorporated in well baby schedule, i.e. 9, 12, 15 mos.)

12-14 mos. 2 doses -- (12 and 15 mos.)

15-16 mos. 1 dose

Med Chi is seeking practicing licensed Maryland physicians who are interested in serving as members of the Board of Physician Quality Assurance. Med Chi is responsible for submitting a list of physicians who meet this requirement to the Governor. Med Chi is soliciting for volunteers from component medical societies as well as advertising in the news media (*The Baltimore Sun* and *Washington Post*) to insure that all Maryland physicians are aware of the vacancy.

Med Chi membership is not a requirement for appointment to the Board of Physician Quality Assurance.

If you are interested in serving on the Board of Physician Quality Assurance please send your curriculum vitae to:

Executive Director  
Medical and Chirurgical Faculty of Maryland  
1211 Cathedral Street  
Baltimore, MD 21201-5585

For more information contact the Executive Director at 301-539-0872 or 1-800-492-1056.

## Doctor/Lawyer/ Teacher Partnership Against Drugs Update

---

Under the leadership of Hiroshi Nakazawa MD, more than 100 physicians statewide have volunteered to participate in the Doctor/Lawyer/Teacher Partnership Against Drugs. In Baltimore City, many physicians and lawyers attended training sessions throughout January to speak in the more than 15 participating schools in Baltimore. On the Eastern Shore, Stephen F. Waters MD reported that doctor/lawyer teams have visited schools in Worcester County, and John Seymour MD and Susan Hayman, Esq. spoke with seventh-grade students at Galena Middle School in December. In Western Maryland, Charles Wright MD and Ann Herbert Rollins, Esq. of Frederick County met with students at West Frederick Middle School in January. In Southern Maryland, Anne Arundel County coordinator Ronald C. Sroka MD reported that his county has more than enough physicians and lawyers for every school in the county.

Other counties in Maryland are currently coordinating the inception of their programs. Mike Massumi MD and Debbie Sweet, Esq., representing Baltimore County doctors and lawyers, recently met with representatives from Baltimore County schools to work the program into the county's current drug education curriculum. Prince George's County is working with Prince George's County schools to coordinate training of physicians and lawyers. Montgomery County is currently testing a pilot of the doctor/lawyer program in its schools.

If you are interested in participating in the Doctor/Lawyer/Teacher Partnership Against Drugs, contact your local component society or Med Chi's Public Relations Department at 301-539-0872 or 1-800-492-1056.

---

## Medicare 'Disenrollment'

---

Maryland physicians are advised that the 'disenrollment' period for Medicare ends February 15, 1991. For physicians who 'disenroll,' their non-participating status will become effective March 1, 1991. To 'disenroll,' contact your Medicare provider representative by February 15, 1991.

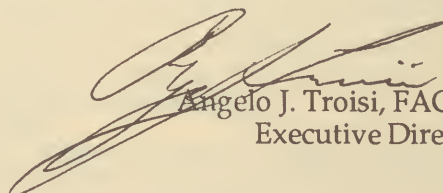

---

## Evaluating Permanent Impairment

---

The AMA *Guides to the Evaluation of Permanent Impairment* (3d ed), which had been out of print, has now been updated and will be available in February 1991. Copies of the new revision may be purchased by contacting the Order Department OP-254/8, AMA, P.O. Box 10946, Chicago, IL 60610. A supplement containing the updated material only is available for those who have previously purchased the 3d Edition of this publication.

The Maryland Workers' Compensation Commission has adopted the 3d Edition of the AMA *Guides* for use by physicians in evaluating the nature and extent of permanent impairments of workers' compensation claimants, except that physicians may continue to use the goniometer evaluation technique for measuring spinal impairment (as outlined in the 2d edition of the *Guides*) or they may use the inclinometer technique specified in the 3d Edition. Evaluations performed should contain a statement as to which edition was used by the the physician. Copies of the 3d edition are on file and may be referred to at public depositories located throughout Maryland. A listing of these depositories was published in the *Maryland Register*, Volume 17, Issue 1 (January 12, 1990).

Angelo J. Troisi, FACHE  
Executive Director

# The Maryland Medical Laboratory Network

## **Quality and Accessibility...**

An industry leader, Maryland Medical Laboratory, Inc. is renowned for its high standards of performance and quality. The advanced technology of Maryland Medical Laboratory, Inc. is available around the clock and easily accessible via an extensive transportation and telecommunication network.

## **Caring with Excellence...**

Maryland Medical Laboratory, Inc. is people serving people. With years of combined laboratory experience, the Maryland Medical Laboratory, Inc. staff of caring Pathologists, medical technologists, and hundreds of administrative and support personnel stand ready to serve you and your patients.  
**INQUIRIES WELCOME**

## **MARYLAND MEDICAL LABORATORY, INC.**

1901 Sulphur Spring Road Baltimore, Maryland 21227

## **THE MARK OF EXCELLENCE**

# WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, P.I.E. Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality.

P.I.E. Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

**Physician Managing Boards**, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

**Quality Rated Insurance Program:** a modified claims-made plan which works in the physician's favor to reward loss-free physicians

and provides added protection not available in other policies.

**A Financially Sound Reinsurance Program** with Lloyd's of London, the world's most prestigious reinsurer.

**An Aggressive Defense Team**, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

### Management of Hypoglycemic Reactions in Obese Non-insulin-dependent Diabetes Patients.

*Doctor: I am a non-insulin-dependent diabetic patient (Type II). I can no longer control my diabetes with sulfonylurea drugs. My doctor has me taking thirty units of Lente insulin each morning. Everytime I reduce my food intake to lose some extra pounds, I get an insulin reaction. What can I do? I want to lose weight but I am afraid to reduce my food intake.*

This brief history describes a patient who has had inadequate diabetes education. The patient should talk with his or her physician about a total review of the diabetes management program. Eighty percent of non-insulin-dependent diabetic patients are overweight and many of them have fallen into the care pattern seen here. They are first given a meal plan, usually without instruction. (A recent survey revealed that 25 percent of patients are *not* given a meal plan.) If there is no improvement in the blood glucose level or weight loss by the next office visit, a sulfonylurea drug is prescribed. After a few more office visits, the blood glucose remains elevated and a failure of the oral agent is concluded. Insulin therapy is often the next step; the dose is gradually increased to phenomenal amounts without adequate control of the blood glucose and, if anything, a weight gain. By this time the physician is frustrated and the patient is depressed.

A better approach to the management of this type of patient would be to discontinue all diabetes therapy and begin anew as follows:

**Diabetes Education.** The physician should either have a diabetes education program available or refer the patient to an adequate program. Unfortunately, in Maryland, most of the health insurance plans do not cover the cost of such programs. However, if the value of the program is pointed out to the patient, he or she will usually accept the expense. The savings on excessive food consumption, sulfonylureas, and insulin therapy will more than compensate for this expense in the long run. For those persons with inadequate or no funds, educational programs will often offer a reduced rate, or the United Way or other help program will assist in providing the needed funds.

**Diet Education.** In most instances, meal plan instruction is a part of the diabetes education program. If it is not or it is inadequate and a patient wants individual guidance, this should be encouraged and provided. Patients will go to more expensive television-advertized diet programs when the physician fails to provide adequate guidance.

**Exercise Program.** Any prescribed exercise or increase in physical activity should be tailored to an individual patient's capacity, preferences, age, and lifestyle; people should choose exercises that are likely to

be repeated frequently and continued over a lifetime. The ideal exercise should be about the same amount each day and at about the same time each day. An ideal exercise could be walking at a pace of 3.5 miles per hour which would use about 300 calories each hour. The cost of stationary bicycles, and rowing or walking machines would be better spent in a diabetes education refresher course. Exercise increases sensitivity to insulin, improves blood glucose control, reduces risk of heart disease, and promotes weight loss.

**Psychosocial Therapy.** Sometimes a weight loss program fails because the patient is depressed or has an alcoholic spouse or children on drugs and cannot cope with the situation. Such problems must be addressed. An assessment of personal and family problems are essential and play an important part in the management of diabetes.

**Sulfonylurea Drug Therapy.** These preparations should be used only after an adequate trial of diet and exercise over a six-month to one-year period have failed to bring about normoglycemia. If a sulfonylurea drug is used, a low dose should be started and the amount increased to the maximal recommended dose if necessary before declaring the drug a failure. If a generic sulfonylurea preparation is prescribed, it is the responsibility of the physician and pharmacist to select one manufactured by a reputable firm, not necessarily the least expensive one.

**Insulin Therapy.** This should be used only after a long-term trial of diet has proved ineffective, there has been sulfonylurea drug failure, or in the presence of a complication such as infection that cannot be satisfactorily treated until the hyperglycemia has been corrected.

If the management of diabetes or any other medical problem is not progressing satisfactorily when it should be doing so, a review of the total care and a fresh start will often produce gratifying results.

## Which Box Would You Rather Deposit Your Insurance Reimbursements In?

If you process your claims through the mail, it takes an average of two months before your reimbursements make it to the bank.

And that can really put you in a box in terms of cash flow.

But not if you join the more than 1800 physicians who are now using HCS electronic claims systems. On the average, they receive payments in days, instead of months. Reason enough to consider using our custom designed systems.

What's more, our systems are labor savers. Stacks of claims that used to take weeks to process by mail can be sent through our claims

network in a matter of hours. Saving you enormously in administrative time. Not to mention postage.

And since HCS has the backing of a billion dollar health care organization, you can depend on us for long term support, service, and solutions as your office needs change.

Call Toll-Free 1-800-543-6711 for more information. Because in rain, snow, sleet or hail, we can deliver insurance reimbursements faster.

Cash Flow, Not Your Overhead.*

## AMA Awarded SuperPRO Contract

Roseanne M. Matricciani RN, Esq.

**T**he Health Care Financing Administration (HCFA) has awarded the Physician Consultant Contract to the American Medical Association (AMA). This contract, which will run for one year but is renewable for four more years, will provide local physicians with input into disagreements between the PROs (Peer Review Organizations) and their overseer, the SuperPRO (Systemetrics, Inc. in Santa Barbara, California).

Since 1986, the PROs have been reviewed by the SuperPRO which looks at a sample of cases and evaluates the appropriateness and quality of the local PROs' review decisions for both approvals and denials. The SuperPRO, however, reviews the medical record only. There is no interaction with the physician who has delivered the care to the patient. Furthermore, as this process has evolved, the SuperPRO's findings have become a formal part of the assessment process for the PROs. Therefore, disagreements between the two organizations may result in the local PRO losing its Medicare contract. (The local PRO for Maryland is the Delmarva Foundation for Medical Care, Inc.)

Under the current Physician Consultant Contract, cases that have been unsuccessfully rebutted to the SuperPRO involving severity or medical practice questions, can be appealed by the PRO to the AMA or HCFA's regional office after receiving the SuperPRO's final determination. When the AMA receives an appeal, each appeal will be referred to a physician volunteer in the area where the case occurred. Physician volunteers chosen to arbitrate disagreements between the SuperPRO and the local PRO will be given medical records and documentation on the PRO and SuperPRO decisions. The physician volunteers will be asked to review the information, choose between the two positions presented, and submit a one-page summary outlining the rationale for their decision.

At the present time, the AMA has approximately 2,100 physician volunteers to review about 1,000 appeals. Volunteers must be board-certified or board-eligible doctors with current hospital admitting privileges. Since the AMA is still accepting volunteers, interested physicians may contact Rose Matricciani RN, JD, c/o Med Chi, 1211 Cathedral Street, Baltimore, MD 21201. If you would like to volunteer, send your name, address, phone number, specialty, subspecialty, and whether your practice is urban or rural, fee-for-service or associated with a health maintenance organization. Physicians who derive in excess of five percent of their income from work with the local PRO are not eligible to be volunteers. ■

# Blood Tests in the Diagnosis of Connective Tissue Diseases

---

Barry S. Handwerger MD

---

*Dr. Handwerger is Professor of Medicine and of Microbiology and Immunology, in the Rheumatology and Clinical Immunology Division, Department of Medicine, University of Maryland School of Medicine, Baltimore. Reprints: Barry Handwerger MD, Rheumatology and Clinical Immunology Division, University of Maryland School of Medicine, 10 South Pine St., Room 8-24, Baltimore, MD 21201.*

---

*Obtaining a complete rheumatological and medical history, performing a thorough physical examination, and carefully evaluating the laboratory data are all absolutely essential in making a diagnosis of connective tissue disease.*

---

The practicing physician is frequently faced with patients who present with symptoms suggesting the presence of an underlying connective tissue disease such as rheumatoid arthritis (RA), systemic lupus erythematosus (SLE), mixed connective tissue disease (MCTD), scleroderma, Sjogren's syndrome, systemic vasculitis or polymyositis/dermatomyositis. In many cases, a detailed history and physical examination will allow the clinician to decide whether or not the patient has a connective tissue disease and, if so, what disease. Over the past several decades, a number of laboratory tests have been developed which can aid the clinician in making a proper diagnosis of a connective tissue disease. This article will review a number of those tests.

## Rheumatoid Factors<sup>1,2</sup>

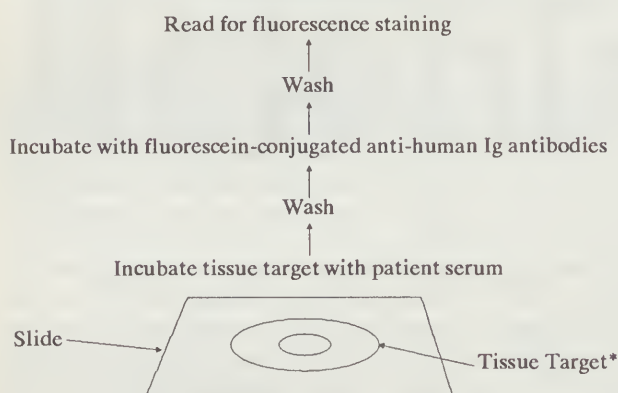

Rheumatoid factors (RF) are antibodies directed toward the crystalizable fragment (Fc) portion of the immunoglobulin (Ig) G molecule. The tests used in most clinical laboratories to detect rheumatoid factors are the latex fixation test and the sheep red blood cell agglutination (Rose-Waaler) test. Both of these tests measure the presence of IgM RF and do not readily detect rheumatoid factors of other Ig isotypes.

The presence in serum of a rheumatoid factor neither makes nor rules out the diagnosis of rheumatoid arthritis. Early during the course of rheumatoid arthritis, only 40 to 50 percent of RA patients are RF-positive. Ultimately, 75 to 80 percent of patients with rheumatoid arthritis will develop RF-positivity; however, 20-25 percent will remain RF-negative. The presence of high-titered ( $> 1:320$ ) RF in a patient with symmetric polyarthritis strongly suggests the diagnosis of RA. RA patients with high-titered RF tend to have more destructive joint disease than RF-negative RA patients. Extra-articular manifestation of RA, including subcutaneous nodules, cutaneous or systemic vasculitis,

**Table 1. Conditions Commonly Associated with Rheumatoid Factor**

1. *Normal individuals* (2 to 4 percent of population)
2. *Asymptomatic relatives of patients with RA*
3. *Aging* (10 to 20 percent of patients > 60 years)
4. *Connective tissue diseases*: RA, SLE, scleroderma, MCTD, dermatomyositis, Sjogren's syndrome
5. *Acute viral infections*: EBV-induced infectious mononucleosis, hepatitis, influenza, and many others
6. *Post-vaccination*: May yield falsely elevated titers of anti-viral antibodies
7. *Parasitic infections*: Trypanosomiasis, kala-azar, malaria, schistosomiasis, filariasis, etc.
8. *Chronic bacterial infections*: Tuberculosis, leprosy, yaws, syphilis, brucellosis, SBE, salmonellosis
9. *Hyperglobulinemic states*: Hypergammaglobulinemic purpura, cryoglobulinemia, dysproteinemias, paraproteinemias
10. *Chronic liver diseases*: cirrhosis of the liver, chronic active hepatitis
11. *Chronic pulmonary diseases*: sarcoidosis, idiopathic pulmonary fibrosis
12. *Neoplasms*: After irradiation or chemotherapy

**Table 2. Patterns of FANA Immunofluorescence**

Pattern	Antigens	Diseases
1. Homogeneous	DNP, histones	Any CTD, drug-induced SLE, several non-rheumatic diseases
2. Rim	dsDNA	SLE
3. Speckled	ENA*	Most CTD
4. Nucleolar	RNA polymerase I, nucleolar RNP, PM-Scl antigen, NOR-90k protein, undefined nucleolar antigens	Primarily scleroderma, but also Sjogren's, polymyositis, and SLE
5. Centromeric	centromere	CREST variant of scleroderma, scleroderma

DNP = deoxyribonucleoprotein; dsDNA = double stranded deoxyribonucleic acid; ENA = extractable nuclear antigens; CTD = connective tissue disease

\* See Table 4

mononeuritis multiplex, serositis, parenchymal lung disease, scleromalacia perforans, and Felty's syndrome, occur almost exclusively in RA patients with high-titered serum rheumatoid factor.

As demonstrated in Table 1, a large number of conditions other than rheumatoid arthritis are also associated with the presence of serum rheumatoid factors. Asymptomatic relatives of patients with rheumatoid arthritis have an increased incidence of RF-positivity. Approximately 2 to 4 percent of normal individuals and 10 to 20 percent of people over 60 years of age will have low-titered rheumatoid factors. Rheumatoid factors are seen in more than 90 percent of patients with Sjogren's syndrome and approximately 20 to 30 percent of patients with SLE, scleroderma, mixed connective tissue disease, or dermatomyositis. A number of acute viral infections and chronic parasitic or bacterial infections are associated with RF-positivity. Patients with subacute bacterial endocarditis will frequently develop serum rheumatoid factors which disappear with successful therapy of the disease. Rheumatoid factors may develop in patients with hypergammaglobulinemic states, chronic liver disease, and chronic pulmonary disease, and following irradiation or chemotherapy for malignancy. In all of these conditions, except RA and Sjogren's syndrome, rheumatoid factors are usually low-titered.

### The Lupus Erythematosus (LE) Cell Test<sup>3</sup>

The LE cell or LE clot test reflects the phagocytosis of nuclei and/or nuclear material coated with complement-fixing IgG anti-deoxyribonucleoprotein (DNP) antibodies. This test is of historic interest only. It is not as sensitive as the fluorescent antinuclear antibody test (FANA) and does not give as much useful information as FANA.

### Fluorescent Antinuclear Antibody Test<sup>3-6</sup>

Patients with SLE and many patients with other connective tissue diseases produce autoantibodies directed against nuclear antigens. These antibodies are usually detected by use of a fluorescent antinuclear antibody test. As illustrated in Figure 1, a FANA is performed by adding patient serum to a slide containing an appropriate tissue target. If the patient's serum contains antinuclear antibodies, the antibodies will bind to the nuclei in the cells of the tissue target. Following the addition of a fluorescein-conjugated antihuman immunoglobulin antibody, the nuclei, which have bound antibody, will fluoresce.

As illustrated in Table 2, five distinct patterns of fluorescence may occur in the FANA test. A homogeneous pattern, in which the nucleus is diffusely and uniformly fluorescent, occurs in patients who make antibodies against deoxyribonucleoprotein or histones. This fluorescence pattern can be seen in patients with any connective tissue disease and in patients with a variety of nonrheumatic diseases (Table 3). The rim

pattern of fluorescence is seen in patients whose serum contains antibodies against double-stranded (ds) deoxyribonucleic acid (DNA). Since anti-dsDNA antibodies are found almost exclusively in patients with SLE, the presence of a rim pattern on a FANA is almost pathognomonic of SLE. A speckled FANA results from the presence of antibodies to nuclear antigens that are extractable in physiological saline - extractable nuclear antigens (ENA). A positive speckled FANA can be seen in most connective tissue diseases. Further characterization by other immunological assays of the antigen specificity of the antibodies responsible for a patient's speckled FANA can be of help in differential diagnosis. A nucleolar pattern of immunofluorescence is seen mainly in patients with scleroderma, but can occur in patients with primary Sjogren's syndrome, polymyositis, or SLE. A centromeric FANA, due to anti-centromere antibodies, is seen primarily in patients with the CREST (calcinosis, Raynaud's syndrome, esophageal dysfunction, sclerodactyly, telangiectasis in scleroderma) variant of scleroderma, but can also be seen in patients with scleroderma who do not have the CREST syndrome and in about 12 percent of patients with primary biliary cirrhosis, approximately half of whom have features of scleroderma. The presence of anti-centromere antibodies in patients with idiopathic Raynaud's syndrome may suggest a transition to scleroderma.

A positive FANA is seen in 95 percent of patients with SLE, 5 to 10 percent of patients with discoid lupus without systemic involvement, 52 percent of patients with RA, 55 percent of patients with scleroderma, 95 percent of patients with MCTD, 40 percent of patients with polymyositis/dermatomyositis, and 33 percent of patients with systemic vasculitis.

Although in the proper clinical setting the presence of antinuclear antibodies (ANAs) in a patient's serum can strongly support the diagnosis of a connective tissue disease, the mere presence of antinuclear antibodies does not definitively prove that the patient has a connective tissue disease. Asymptomatic relatives of

patients with lupus have an increased incidence of ANA-positivity. Approximately 25 percent of normal, healthy females over the age of 60 have low-titered ANA in their sera, while approximately 5 percent of older individuals have positive ANA in significant titers. As illustrated in Table 3, ANAs have been detected in a variety of nonrheumatic illnesses. In addition, a number of drugs can induce ANA-positivity, with or without other evidence of a lupus-like syndrome. When a positive ANA occurs in a nonrheumatic disease, the ANA is usually low-titered. The presence of low-titered ANA-positivity, therefore, is nondiagnostic. The proper interpretation of a positive ANA must be made in the context of the patient's history, physical examination, and other laboratory findings.

### Anti-DNA Antibodies<sup>7-12</sup>

Antibodies against single-stranded (ss) DNA may be present in the sera of patients with any connective tissue disease or in the sera of patients with nonrheumatic diseases, such as chronic active hepatitis or primary biliary cirrhosis. In addition, a small percentage of normal, healthy individuals have low-titered anti-ssDNA antibodies. As a result, the presence of anti-ssDNA antibodies is of little diagnostic help in the differential diagnosis of connective tissue diseases.

In contrast, antibodies to double-stranded (native) DNA are found almost exclusively in the sera of patients with SLE. Anti-dsDNA antibodies tend to be present in SLE patients during periods of active disease, especially active renal disease. Although the titer of anti-dsDNA antibodies frequently parallels the activity of renal lupus, high-titered anti-dsDNA antibodies can be seen without active renal involvement.

In most clinical laboratories, anti-dsDNA antibodies are detected by radioimmunoassay or enzyme-linked immunoabsorbent assay (ELISA). In performing either of these assays, the laboratory must be extremely careful to exclude the presence of any single-stranded DNA in their DNA antigen preparation. A *Crithidia luciliae* immunofluorescence assay can also be used for the detection of anti-dsDNA antibodies. *Crithidia* is an organism which has a kinetoplast that contains helical native DNA, free of other nuclear antigens, including single-stranded DNA. Since immune reactivity with the kinetoplast indicates the presence of anti-native DNA antibodies, the *Crithidia* assay is more specific for antibodies to dsDNA than either the radioimmunoassay or ELISA; however, it is less sensitive.

### Anti-ENA Antibodies<sup>5,6,13-20</sup>

Antibodies to a large number of extractable nuclear antigens have been described in patients with connective tissue diseases. As illustrated in Table 4, antibodies against the Sm or Smith antigen are found exclusively in patients with SLE; however, only about

**Table 3. Nonrheumatic Diseases with (+) ANA**

1. Asymptomatic relatives of SLE patients
2. Aging (present in up to 25 percent of normal women over 60 years of age)
3. Chronic active hepatitis
4. Primary biliary cirrhosis
5. Myasthenia gravis
6. Hashimoto's thyroiditis
7. Diabetes mellitus
8. Ulcerative colitis
9. Uveitis
10. Idiopathic pulmonary fibrosis
11. Pneumoconiosis
12. Burns
13. Leprosy
14. EBV-induced infectious mononucleosis
15. Thymomas and selected other malignancies
16. Drugs (hydralazine, procainamide, anticonvulsants, chlorpromazine, alpha-methyl dopa, isoniazide, sulfonamides, penicillins, tetracyclines, oral contraceptives, propylthiouracil, D-penicillamine)

25 percent of patients with SLE have anti-Sm antibodies. Patients who are anti-Sm antibody-positive are almost always also anti-RNP antibody-positive. Anti-RNP antibodies can be found in the sera of patients with many different connective tissue diseases, including SLE, RA, scleroderma, and hypocomplementemic urticarial vasculitis, but are especially common in patients with mixed connective tissue disease. Antibodies to the Ro and La antigens (or SS-A or SS-B antigens, as they are also called) occur in patients with primary Sjogren's syndrome, and in patients with SLE, scleroderma, or RA who have secondary Sjogren's syndrome. Patients who are anti-La antibody-positive are almost always anti-Ro antibody-positive. The opposite, however, is not true. Anti-Ro antibodies, in the absence of anti-La antibodies, are also seen in patients with classical SLE in the absence of Sjogren's syndrome, ANA-negative SLE, subacute cutaneous lupus, and lupus associated with C2 deficiency. Anti-Ro antibodies appear to play an important role in the skin lesions and the complete heart block that occur in children with neonatal SLE. Anti-Ro antibodies are uniformly present in the sera of these children and their mothers.

Antibodies to PL-7, PL-12, and alanine tRNA are rare, but are highly specific for myositis. Antibodies against Jo-1 and PM-Scl (PM-1) occur in patients with polymyositis and in patients with dermatomyositis-myositis and polymyositis-scleroderma overlap syndromes, respectively. Antibodies to Mi<sub>2</sub> are found in 25 percent of patients with dermatomyositis and only rarely in patients with other connective tissue diseases. Antibodies against Scl-70 (topoisomerase I) are found almost exclusively in patients with scleroderma. Forty-three percent of patients with diffuse scleroderma and 18 percent of patients with limited scleroderma are anti-Scl-70 antibody-positive. Anti-Ku antibodies are found in 35 to 50 percent of patients with SLE, MCTD, and polymyositis-scleroderma overlap. Approximately 2 to 10 percent of SLE patients have antibodies to the proliferating cell

nuclear antigen (PCNA or cyclin), which is an auxiliary protein of DNA polymerase-delta. Antibodies to RNA polymerase have been reported to be present in 100 percent of patients with SLE and MCTD, 78 percent of patients with RA, and 4 percent of scleroderma patients.

Although most clinical laboratories are able to measure anti-ENA antibodies directed against Sm and RNP, only a few clinical labs measure antibodies to Ro and La. Assays for the detection of antibodies to other ENA are only performed in a few clinical or research laboratories and are not generally available as clinical diagnostic tests.

### Anti-histone Antibodies<sup>21</sup>

Histones are the most abundant nuclear proteins. Anti-histone antibodies are present in the sera of almost all patients with drug-induced lupus and 25 to 60 percent of patients with idiopathic SLE.

### Anti-phospholipid Antibodies<sup>22-26</sup>

Lupus anticoagulants are IgG or IgM antibodies directed against the acidic phospholipids important in the formation of the prothrombinase complex. Lupus anticoagulants cause a prolongation in all phospholipid-dependent coagulation tests, including the partial thromboplastin time (PTT or aPTT), Russell's viper venom time, kaolin plasma clot time, and kaolin PTT. The prothrombin time (PT) is usually normal or only slightly prolonged, and the thrombin time is normal. When a lupus anticoagulant is present in plasma, the prolonged PTT is not corrected by a 1:1 mix of the plasma containing the lupus anticoagulant with normal plasma. Moreover, when a PT or PTT is performed using diluted thromboplastin, the time to clot formation is disproportionally prolonged by the presence of a lupus anticoagulant.

Although plasma containing a lupus anticoagulant does not clot as rapidly as normal plasma in phospholipid-dependent coagulation tests, patients with lupus anticoagulants only rarely have any associated bleeding disorder, and then only when there is concomitant thrombocytopenia, hypoprothrombinemia, or vasculitis. Patients with a circulating lupus anticoagulant, in fact, have a very high incidence of arterial or venous thrombosis, recurrent spontaneous abortions, and intrauterine fetal death.

Six to 16 percent of lupus patients will develop a lupus anticoagulant sometime during the course of their disease. As illustrated in Table 5, lupus anticoagulants can also be found in some patients with other rheumatic diseases, nonrheumatic autoimmune diseases such as idiopathic thrombocytopenic purpura (ITP) or autoimmune hemolytic anemia, and several neoplasms. In addition, lupus anticoagulants can occasionally be seen in patients treated with drugs that can induce a lupus-like disease and in a small percentage of otherwise healthy individuals. Patients

**Table 4. Antibodies to Extractable Nuclear Antigens (ENA): Disease Associations**

EDN	Connective Tissue Diseases (CTD)
Sm	SLE
RNP	MCTD, SLE, RA, scleroderma, other CTD
Ro/SS-A	Sjogren's, SLE, other CTD
La/SS-B	Sjogren's, SLE
PL-7 (threonyl-tRNA synthetase)	polymyositis
PL-12 (alanine-tRNA synthetase)	polymyositis
Jo-1 (histidyl-tRNA synthetase)	polymyositis, dermatomyositis
PM-Scl (PM-1)	polymyositis, polymyositis-scleroderma overlap
Mi <sub>2</sub>	dermatomyositis
Scl-70 (topoisomerase I)	scleroderma
Ku	SLE, MCTD, polymyositis-scleroderma overlap
RNA polymerase I	SLE, MCTD, RA, scleroderma
PCNA (Cyclin)	SLE

with circulating lupus anticoagulants have a higher than normal incidence of ANA-positivity, anti-erythrocyte antibodies (with or without autoimmune hemolytic anemia), anti-cardiolipin antibodies, a false positive Venereal Disease Research Laboratory (VDRL) test for syphilis, thrombocytopenia, and cryoglobulinemia.

Cardiolipin (diphosphatidylglycerol) is a major component of the VDRL antigen. Anti-cardiolipin antibodies are found in patients with SLE and other connective tissue diseases, and in a small percentage of otherwise healthy individuals. Clinically, anti-cardiolipin antibodies are associated with a false positive VDRL test for syphilis and the presence of a circulating lupus anticoagulant. Patients with anti-cardiolipin antibodies, like patients with a circulating lupus anticoagulant, have a high incidence of arterial or venous thrombotic episodes, recurrent spontaneous abortions, and intrauterine fetal deaths.

### Complement<sup>27-29</sup>

Complement is a series of proteins found in the serum and body fluids which, when activated, interact in a defined sequential manner to produce a number of biologically active products which are important in inflammation and which can destroy cells that have bound activated complement components to their cell surfaces. As illustrated in Figure 2, there are two pathways of complement activation, the classical pathway and the alternative pathway. Activation of the classical pathway is initiated when IgG- or IgM-containing antibody-antigen complexes fix the first component of complement (C1q) to the Fc portion of the immunoglobulin molecule. In contrast, the alternative pathway can be activated without antibody. Its activation can be triggered by inflammatory proteases or polymeric substances, such as pneumococcal polysaccharide SIII. Activation of either complement pathway involves the conversion of proenzymes to active proteolytic enzymes, with the subsequent sequential proteolysis of other components of complement.

As illustrated in Table 6, during the course of complement activation, a number of biologically active molecules are generated. These molecules can lead to increased vascular permeability, the activation of mast cells and basophils, adherence of complement-coated cells or particles to glomeruli and various immune cells (immune adherence), enhanced phagocytosis, chemoattraction of monocytes, macrophages and polymorphonuclear leukocytes, modulation of B cell function, and cell lysis mediated by the terminal membrane attack complex of complement.

In a number of connective tissue diseases, the activation of complement appears to be a central component in the production of tissue pathology. The deposition of circulating immune complexes in tissues leads to complement activation, with the subsequent generation of complement-derived chemotactic factors (C5a, C5b67). Polymorphonuclear leukocytes (PMNs) are

**Table 5. Diseases Associated with Circulating Lupus Anticoagulants**

1. *SLE* (6-16 percent patients)
2. *Other rheumatic diseases*: RA, JRA, MCTD, Sjogren's, polyarteritis nodosa, scleroderma, systemic and pulmonary vasculitis, Behcet's disease
3. *Other autoimmune diseases*: ITP, autoimmune hemolytic anemia
4. *Neoplasia*: Multiple myeloma, Hodgkin's lymphosarcoma, prostatic and cervical cancer
5. *Drug-induced*: chlorpromazine, procainamide, hydralazine
6. *No associated disease* - "normals"

**Figure 2. The Two Pathways of Complement Activation**

**Table 6. Biologically Active Products of the Complement System**

Complement Product	Biological Activity
C4, C2 kinin	Increased vascular permeability
C3Bb	Chemoattractant for neutrophils and monocytes
Bb	Spreading of monocytes
C3a	Anaphylatoxin; suppresses B cell responses
C5a	Anaphylatoxin; chemoattractant for neutrophils and monocytes
C3b	Multiple effects depending on cell bearing C3b receptors; immune adherence; enhances phagocytosis
iC3b	Binding to glomeruli, monocytes, granulocytes and natural killer cells
C3d	May modulate B cell function
C567	Can bind to "innocent bystander" cells and initiate formation of C5b-C9 complex
C5b-C9	Membrane attack complex

attracted to the site by the chemotactic complement components. The PMNs attempt to phagocytize the deposited immune complexes and in so doing become activated and release their lysosomal enzymes, which results in tissue damage.

Several different assays are utilized in clinical laboratories to quantitate complement levels. The most commonly used is a total hemolytic complement

or CH<sub>50</sub> assay. This assay measures the ability of a test specimen to lyse antibody-coated sheep erythrocytes. The reciprocal of the dilution of test specimen which results in the lysis of 50 percent of the antibody-coated cells is reported as the complement titer. This assay measures the integrity of the entire classical pathway of complement activation. The concentration of individual components of complement can also be measured in either functional assays or in immunological assays. Clinically, the most commonly measured of the individual complement components are C3 and C4.

Low serum complement levels are indicative of complement consumption, decreased synthesis of complement compounds, or an inherited complement deficiency. Decreased serum complement levels secondary to complement consumption can be seen in patients with SLE, particularly those with active lupus nephritis; essential cryoglobulinemia; systemic vasculitis; nonrheumatic, immune complex-mediated diseases such as post-streptococcal glomerulonephritis and membranoproliferative glomerulonephritis; and systemic infections such as subacute bacterial endocarditis, infected atrioventricular shunts, pneumococcal sepsis, gram-negative sepsis, viremias, or parasitemias. Patients with severe hepatic failure and severe malnutrition may have low serum complement levels due to decreased synthesis of complement components. Decreased complement synthesis can be distinguished from increased complement consumption by measurement of the plasma levels of complement activation factors such as C3a. C3a is a split product of C3, which is found in measurable quantities in serum only during periods of active complement activation.

Inherited deficiencies of all eleven classical pathway proteins and several of the control proteins have been described. C2 deficiency is by far the most common complement deficiency, occurring in about 1 percent of the normal population; all of the other inherited component deficiencies are relatively rare. C1 esterase inhibitor deficiency causes hereditary angioedema. Inherited deficiency of C1q, C1r, C1s, C2, C4, C5, C6, C7, or C8 have been associated with lupus-like connective tissue disease or Raynaud's syndrome. Deficient processing of immune complexes is thought to be the pathogenic mechanism responsible for the association of complement deficiencies with rheumatological diseases. Inherited deficiency of C3 is associated with recurrent pyogenic infections. And, inherited deficiencies of C5, C6, C7, C8, and C9 are associated with recurrent sepsis with *Neisseria* species, presumably due to failure of complement-mediated lysis of the microorganisms.

**Muscle Enzymes<sup>30-33</sup>**

Creative phosphokinase (CPK), aldolase, serum glutamic oxaloacetic transaminase (SGOT), and lactate dehydrogenase (LDH) activities are elevated at some time during the course of disease in essentially all

patients with polymyositis, dermatomyositis, or the myositis associated with SLE, MCTD, scleroderma, or rheumatoid arthritis.

**Hepatitis B Serologies<sup>34-36</sup>**

In several different clinical settings, infections with hepatitis B virus are associated with rheumatic symptoms. During the prodromal phase of hepatitis B virus infection, patients frequently complain of diffuse polyarthralgias and may have frank polyarthritis. In 10 to 54 percent of patients with polyarteritis nodosa, the disease is associated with hepatitis B infection, the demonstration of hepatitis B surface (HB<sub>s</sub>) antigen in involved arteries, and the formation of hepatitis B virus-anti-hepatitis B virus immune complexes. One-third to two-thirds of patients with "essential" cryoglobulinemia have HB<sub>s</sub> antigen or anti-HB<sub>s</sub> antibodies present in their sera or cryoprecipitates. In each of these clinical situations, appropriate hepatitis B serology can be of help in differential diagnosis.

**Cryoglobulins<sup>37-39</sup>**

Cryoglobulins are cryoprecipitable immunoglobulins or immune complexes, which redissolve on warming to 37°. The intravascular deposition of cryoglobulins *in vivo* can lead to the production of cutaneous or systemic vasculitis and glomerulonephritis. It should be remembered that whenever blood is drawn for quantitation of cryoglobulin levels, the blood must be kept at 37° prior to and during clotting, otherwise a significant portion of the cryoglobulin may be removed from the blood with the clot. Cryoglobulins are usually quantitated by allowing serum to cryoprecipitate at 0 to 5° C for twenty-four to seventy-two hours and then measuring either the cryocrit or the amount of cryoprecipitate formed per ml of serum.

As illustrated in Table 7, cryoglobulins can be broadly classified into three types. Types I and II cryoglobulins are found most commonly in patients with immunoproliferative diseases. Type III cryoglobulins, which are found in approximately half the patients

**Table 7. Cryoglobulins**

Type	Ig Type(s)	Usual Associated Diseases
I (25%)	monoclonal IgM, IgG, IgA or light chain	immunoproliferative disease
II (25%)	mixed cryo with monoclonal RF (IgM, IgG, IgA) against polyclonal IgG	immunoproliferative disease
III (50%)	Mixed cryo with polyclonal RF against polyclonal IgG, may contain non-Ig molecules as well	(1) autoimmune and rheumatic diseases (SLE, RA, Sjogren's systemic vasculitis), ITP, AIHA (2) infectious diseases (hepatitis, EBV-induced mononucleosis, CMV, SBE, leprosy, syphilis, trypanosomiasis) (3) essential cryoglobulinemia

with cryoglobulinemia, contain polyclonal rheumatoid factors and polyclonal IgG, and may contain non-immunoglobulin molecules. Type III cryoglobulins are found in patients with rheumatic diseases such as SLE, RA, primary Sjogren's syndrome, and systemic vasculitides, and in patients with idiopathic thrombocytopenia purpura, autoimmune hemolytic anemia, a number of viral, bacterial and parasitic infections, and essential cryoglobulinemia.

### Immune Complex Assays<sup>40-42</sup>

Clinically, circulating immune complexes are most commonly measured by quantitating C1q binding to the immune complexes by the Raji cell assay, which measures the binding of complement-fixing immune complexes to complement receptors on Raji cells, and by an anti-C3 solid-phase radioimmunoassay. These assays are plagued by problems of standardization and by a number of potential artifacts, including the *ex vivo* formation of immunoglobulin aggregates which can be mistakenly quantitated as immune complexes. The immune complex assays vary in specificity and sensitivity, and because of inherent idiosyncracies, none of the assays are able to detect all species of immune complexes. As a result, the quantitation of circulating immune complexes is of limited clinical usefulness. These assays are best used as research tools.

### Synovial Fluid Analysis<sup>43,44</sup>

The examination of synovial fluid from a clinically involved joint can be an extremely useful test in the differential diagnosis of rheumatic diseases. Synovial fluids can generally be classified into three groups - noninflammatory, inflammatory, and septic. Noninflammatory synovial fluids are straw to yellow in color, transparent, and have a high viscosity and a white blood cell count (WBC) of  $< 2000/\text{mm}^3$ , generally with  $< 25$  percent polymorphonuclear leukocytes. Noninflammatory synovial effusions can be seen in a number of diseases, including osteoarthritis, traumatic arthritis, mechanical derangement, hypothyroidism, acromegaly, hyperparathyroidism, hemochromatosis, ochronosis, villonodular synovitis, sickle cell disease, Ehlers-Danlos syndrome, and amyloidosis.

Inflammatory synovial fluids are yellow in color, translucent, and have a low viscosity and a white cell count generally in the range of  $2000-75,000/\text{mm}^3$  usually with greater than 50 percent PMN. Inflammatory synovial effusions are seen in patients with rheumatoid arthritis, juvenile rheumatoid arthritis (JRA), SLE and other connective-tissue diseases, ankylosing spondylitis and other seronegative spondyloarthropathies, Behcet's disease, familial Mediterranean fever, Whipple's disease, sarcoidosis, subacute bacterial endocarditis, serum sickness, multicentric reticulohistiocytosis, and the crystal-induced arthritides (gout, pseudogout and hydroxyapatite arthritis).

Septic joint fluids are of variable color and viscosity,

are generally opaque, and often contain  $100,000 \text{ WBC}/\text{mm}^3$  with greater than 95 percent PMN. Fluids containing more than  $100,000 \text{ WBC}/\text{mm}^3$  should be considered to be septic until proven otherwise. Even the demonstration of crystals in such a fluid does not rule out coexisting infection. When synovial fluid cell counts are between  $50,000$  and  $100,000 \text{ WBC}/\text{mm}^3$ , differential diagnosis is more difficult. Septic fluids can have white cell counts in this range or even lower, particularly in immunocompromised hosts or in patients whose infections have been partially treated with antibiotics. Patients with tuberculosis or gonococcal joint infections do not usually have high synovial fluid white cell counts. Moreover, synovial fluids from patients with crystal-induced arthritis, rheumatoid arthritis, and Reiter's disease will frequently have WBC counts in this intermediate range, and occasionally even higher.

Whenever septic arthritis is considered in the differential diagnosis, synovial fluid should be sent for culture and Gram-stained. All inflammatory synovial fluids should be examined by compensated polarized light microscopy for the presence of urate or calcium pyrophosphate dihydrate crystals to rule in or out the diagnoses of gout and pseudogout.

### HLA Typing<sup>45,46</sup>

The major histocompatibility (transplantation antigen) complex in man is called the HLA (human leukocyte antigen) system. There are three classes of HLA antigens. The class I antigens are the antigens of the HLA-A, -B and -C loci; class II HLA antigens are the antigens of the HLA-DP, -DQ and -DR loci. Genes controlling the synthesis of C4, C2 and Factor B of the complement system are located within the HLA gene complex on human autosomal chromosome 6. These three complement components are the class III HLA proteins.

Over the past two decades, it has been recognized that a number of diseases occur with increased frequency in individuals who have certain HLA antigens. Table 8 lists some of the reported associations of HLA with rheumatic diseases. The recognition of the association of specific HLA antigens with specific diseases has significantly enhanced our understanding of the genetics and epidemiology of those diseases.

HLA typing of any given individual patient, however, is of little or no clinical diagnostic value. None of the diseases which are HLA-associated are 100 percent associated with any specific HLA antigen; as a result, there are patients who have the disease and do not have the specific HLA marker for that disease. Moreover, most individuals in the population who possess a specific disease-associated HLA antigen do not have the disease in question. As a result, HLA typing should not be used as a diagnostic tool.

During the past five years, sophisticated molecular techniques, including analyses of restriction fragment length polymorphisms and DNA sequencing, have begun to be applied to the study of HLA and disease

**Table 8. Reported Associations of HLA and Rheumatic Diseases**

Disease	HLA Antigen
Ankylosing	B27
Inflammatory spondylitis	B27
Inflammatory bowel disease-associated spondylitis	B27
Reiter's syndrome	B27
Reactive arthritis	B27
Isolated sacroiliitis	B27
Whipple's disease	B27
Psoriatic arthritis (axial and peripheral arthritis)	B13, Bw16, B17, B27, B38
Behcet's disease	B5, (w51)
Takayasu's Disease	B5, DRw52, DR2
SLE	DR2, DR3, DQw1, DQw2, C4AQO
Sjogren's (primary)	DR2, DR3
JRA	B27, Bw35, DR4, DR5, DRw8 (with different clinical subsets of JRA)
Dermatomyositis	DR3
Rheumatoid arthritis	DR4, DR1
Giant cell arteritis	DR4

associations. Over the next few years, these techniques should permit a much more refined analysis of the mechanisms responsible for the association of specific HLA antigens with various disease processes.

### Summary

Making the diagnosis of connective tissue disease can at times be extremely difficult. Obtaining a complete rheumatological and medical history, and performing a thorough physical examination are absolutely essential. This article has reviewed several of the laboratory parameters which can aid the clinician in the differential diagnosis of connective tissue diseases. Which tests should be ordered in any given individual patient should be determined by the clinical setting. Careful evaluation of the laboratory data, in the context of the patient's history and physical examination, should, in general, allow the clinician to make the proper rheumatological diagnosis.

## ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

7120 Contee Road  
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- Excellent suburban location;
- A radiologist is available for professional consultation;
- Immediate reports;
- A FAX is on site for scheduling or processing reports;
- We hand deliver duplicate films to your office.
- Evening hours available.

Most Maryland area insurers cover MRI.

### Acknowledgments

The author thanks Ms. Shirley Harrington for excellent secretarial assistance in the preparation of this manuscript. This work was supported by United States Public Health Service grants AR 37628 and AI 27885, and by grants from the Veterans Administration (Merit Review) and the Maryland Lupus Foundation. ■

THE MRI CENTER  
AT MARYLAND  
GENERAL HOSPITAL —  
A NEW RESOURCE  
FOR MARYLAND  
PHYSICIANS

Maryland General Hospital has installed a Picker Vista MRI 1.0 Telsa Scanner. This system permits high resolution, thin slice imaging capability and small fields of view, all with superior image quality.

Our System and services offer many benefits to area physicians...

- Convenient patient appointments.
- A dictaphone voice retrieval system which allows instant access to dictated MRI reports from any telephone including home, office or even car phones.
- A large magnet gantry and table to accommodate large or obese, and claustrophobic patients up to 300 lbs.
- Twenty-four hour or less report turn around.
- A financial counselor to facilitate MRI payments.
- Actual copy of study available to physician upon request.

The MRI Center at Maryland General Hospital  
827 Linden Avenue Baltimore, Maryland 21201  
301-225-8121

# Maryland's Cytology Labs: 1989-90 Proficiency Testing Results

---

John M. DeBoy DrPH and Barbara R. Jarboe CT (ASCP, IAC)

---

*From the Community Health Surveillance and Laboratories Administration's Division of Laboratory Licensure, Certification and Training, Department of Health and Mental Hygiene, Baltimore. Reprints: John DeBoy DrPH, Division of Laboratory Licensure, Certification and Training, Laboratories Administration, 201 West Preston St., Baltimore, MD 21201.*

---

*In 1990, the Department of Health and Mental Hygiene provided proficiency-testing to seventy-three cytology laboratories, and 293 technical employees. Sixty-three of these labs, 132 of 154 pathologists, and 130 of 139 cytotechnologists passed without having to undergo retesting or retraining. Failing laboratories accounted for approximately 2 percent of the cervicovaginal slides diagnosed in 1989. Labs with the lowest passing rates were small ones operated by single pathologists not employing cytotechnologists. Eight pathologists either surrendered their state permit or were required to obtain additional training; no cytotechnologist required additional training.*

---

In the fall of 1987, the Laboratories Administration of the Maryland Department of Health and Mental Hygiene (the Department) recruited expert volunteers to help the Department develop and implement a proficiency-testing (PT) program covering all cytology laboratories holding a Maryland permit to operate. A Maryland law<sup>1</sup> mandating this PT program took effect July 1, 1988, and state regulations<sup>2</sup> implementing the program were promulgated effective October 30, 1989. Pilot-testing was conducted from February through July 1989. The first full, regulatory testing cycle for in-state laboratories was conducted from January through August 1990. This paper presents and discusses the PT results from the pilot-tests in 1989 and the first, fully-implemented regulatory cycle in 1990.

## Materials and Methods

The methods and procedures used to develop Maryland's cytology PT program have already been described in detail.<sup>3,4</sup> Each pathologist and cytotechnologist being tested received a test set of ten glass, cervicovaginal (Papanicolaou) slides of actual patient material. Examinees were required to diagnose each slide by assigning it to one of four diagnostic test categories which had been defined using standardized diagnostic terminology.<sup>3</sup> Each categorized slide received ten, five, or zero points, depending on whether the diagnosis was correct, partially incorrect, or incorrect, respectively.<sup>4</sup> All test slides had been previously evaluated and accepted by a panel of expert pathologists who had assigned each test slide to the correct diagnostic test category.

Maryland's cytology PT program resembles the way cytology is actually practiced in the field; PT procedures allow pathologists who routinely employ cytotechnologists to have a randomly selected cytotechnologist first screen the test set for the pathologist. Pathologists who do not employ cytotechnologists are required to screen their own slides when taking a test.

Examinees were required to obtain at least ninety out of a possible hundred points to pass an exam, where each of ten correctly diagnosed slides was worth ten points. Examinees who failed their first test during the 1990 cycle were required to sit for a second examination within thirty days. Those who failed a second test had to obtain five days of documented retraining before being allowed to sit for a mandatory third test. Each cytotechnologist received two test scores. The first, an educational score, was derived utilizing the same grading system used in grading pathologists; full credit was based solely on direct correlation with the correct answer. The second, a regulatory score, graded cytotechnologists less stringently. Full or partial credit was awarded if the cytotechnologist's incorrect answer would not affect the follow-up of the patient (e.g., a dysplasia versus a cancer diagnosis would still warrant that the slide be seen by a pathologist).

The pilot cycle in 1989 consisted of a single test being given to each examinee. No retests were given in 1989. In this paper, unless stated otherwise, all test results from the 1990 cycle were those obtained from the first tests taken in that cycle. Data from retests in 1990 were excluded from most Tables to allow for comparison with the pilot-test cycle's results and to preclude possible skewing of the 1990 data. All cytotechnologist test results in this paper, unless otherwise noted, were based on educational scores to allow for comparison with pathologist test results. All data in this paper come only from cytology labs located physically within the State of Maryland.

## Results

Administrative data collected as part of the 1990 cytology PT cycle showed that seventy-three in-state cytology laboratories held a Maryland permit to operate in 1990 and that these laboratories processed approximately 1.17 million cervicovaginal slides in 1989. Table 1 shows that a majority (68.4 percent) of these labs processed fewer than 10,000 cervicovaginal slides per year. Seven large labs accounted for about 700,000 (60 percent) of all the cervicovaginal slides processed in the State. Table 2 shows that most labs are small operations employing only one to three technical personnel.

Laboratory PT scores by passing rates, lab workloads, and numbers of cytotechnologists are given in Tables 3-5, respectively. Table 6 shows the types and distribution of 528 examinees who sat for an initial examination. Breakdowns of pathologists' and cytotechnologists' test scores are given in Tables 7-10. Table 11 lists the PT scores of pathologists required to sit for retests. Statistics on retests are presented in Tables 12 and 13. None of the nine cytotechnologists who failed a first test failed a retest. Sixteen (73 percent) of the twenty-two pathologists required to sit for a retest did not employ a cytotechnologist (Table 10). No pathologist who employed a cytotechnologist failed a retest (Table 13). Error rates involving false

	Passing Rate (%)	
	1989	1990
Pathologists		
Did employ cytotechs.	84/97 (86.6)	106/112 (94.7)
Did not employ cytotechs.	16/32 (50.0)	26/42 (61.9)

negatives, false positives, and unsatisfactory slides are presented in Table 14. None of the differences in comparable proportions of Maryland data in Table 14 were significant (i.e., the probability that a difference was due to chance was 0.05 calculating  $\chi^2$  tests for equality of any two independent proportions).

### Discussion

There was a 13.3 percent increase from 1989 to 1990 in the number of cytology laboratories in Maryland which passed their first test; this increase was statistically significant (Table 3). Improvement was expected because most examinees in 1990 had participated in the pilot-testing cycle in 1989 and were familiar and

more at ease with the PT process. This improvement would probably have been even greater if the fifty-six (19.1 percent) of the 293 examinees who did not participate in 1989 had been able to do so (Table 6). This addition of more than fifty first-time examinees was a surprise to the authors who made a concerted effort to identify all potential examinees in 1989 and provide them with the opportunity to take the pilot test. Many of the first-time examinees in 1990 chose not to participate in the pilot, were new graduates, or were employees of cytology laboratories who had previously worked outside of Maryland.

The drop, from nineteen to ten, in the number of laboratories that failed their first test (Table 4) is very important when one looks at the size of these laboratories. In 1989, 68 percent of the laboratories failing a first test screened fewer than 5,000 slides per year. In 1990, laboratories of this size accounted for 90 percent of these failures; no laboratory reading more than 20,000 slides per year failed a test. This means that the total number of slides diagnosed in Maryland laboratories failing the first test in a PT cycle dropped from approximately 155,000 slides (14 percent) in 1989 to approximately 23,500 (2 percent) in 1990. As a group, the State's larger laboratories achieved the highest passing rate. This may be attributable to greater experience associated with larger workloads and to the fact that all of the larger laboratories employed cytotechnologists. Small laboratories, operated by one or more pathologists, that do not employ cytotechnologists exhibited the highest failure rates in both 1989 and 1990 (Table 5).

The number of pathologists passing the first test in the 1990 PT cycle increased by 8.2 percent compared to 1989 (Table 7). Cytotechnologists' regulatory and educational pass rates increased by 5.8 percent and 7.6 percent, respectively (Table 7). Improving individual scores are due, at least in part, to increasing familiarity with the test on the part of examinees. In a few tests during the pilot cycle, pathologists' poor performances were associated with blanket acceptance of their cytotechnologists' screening results. The number of very low educational scores by pathologists (i.e., less than eighty) dropped from nine to five (Table 8); the number of low scores by cytotechnologists increased from three to seven (Table 9). The increased number of very low scores for cytotechnologists, while not statistically significant, may be associated with more marginally competent or less experienced cytotechnologists sitting for their first test in 1990.

As in 1989, pathologists in 1990 who screened their own set of test slides were more likely to fail their first test in the PT cycle (Table 10). The passing rate for pathologists who employed cytotechnologists improved by 8.1 percent. The passing rate for those who did not employ cytotechnologists improved by 12.0 percent. The greater rate of improvement in the latter group is encouraging. As these solo practitioners are being made aware of their shortcomings, more of them are obtaining additional training or, as in three cases

(Table 11), voluntarily surrendering their State permit to operate a cytology laboratory.

Fourteen (63.5 percent) of twenty-two pathologists who failed their first test in the 1990 PT cycle, passed their first retest (Table 11). Nine (40.9 percent) of these same twenty-two pathologists passed that retest with a score of one-hundred. Eight pathologists who failed their initial test also either failed their first retest or voluntarily surrendered their State permit (Tables 11 and 12). This shows that the mandatory retesting aspect of Maryland's PT program is effective in separating competent pathologists from those truly in need of retraining. The authors realize that the effectiveness of the existing system subjects a few competent pathologists to a retest, but from the authors' public health point of view, this is acceptable compared to some less stringent alternative testing process that would fail to identify marginally competent or incompetent examinees.

Requiring a score of ninety to pass also appears justified under the existing grading system. Four pathologists who failed a retest and had to obtain retraining would not have been identified if the passing score had been set at eighty (Table 11). Including the three pathologists who surrendered their permit, there are eight pathologists who either failed or might have failed a retest. This means that 5.2 percent (8/154) of the State's pathologists would have required retraining in 1990. This percentage is equivalent to the 4 to 7 percent of pathologists that New York State's cytology PT program annually identified for retraining between 1980 and 1988.<sup>5</sup>

A comparison of the number of total errors and several individual types of errors made in 1989 and 1990 shows that none of the differences were significant at the 0.05 probability level. However, the tendency toward a reduction in error rates is present in all cases (Table 14). Although a direct comparison with error rates in the New York State PT program<sup>6</sup> cannot be performed because the Maryland and New York programs used different grading systems, the overall error rates in both states are very close. This provides additional evidence that Maryland's cytology PT program, which is based on many of the same methods pioneered in New York, is functioning effectively.

The federal Clinical Laboratory Improvement Amendments of 1988 and final rules<sup>7</sup> published by the Health Care Financing Administration (HCFA) require all cytology laboratories in the country to enroll in an approved PT program that meets very specific federal standards by January 1, 1991. The PT standards called for under the HCFA rules differ in a number of ways from those in Maryland's program. These differences are quite controversial and a full discussion of the advantages and disadvantages of these differences will be published elsewhere.

However, in its present form, Maryland's cytology PT program is functioning efficiently, and is effectively accomplishing both Maryland's and the federal government's PT objectives. These include providing

PT samples which will be tested the same as patient specimens, identifying the incompetent laboratory or laboratorian in an equitable and legally defensible manner, and providing a monitored retraining and retesting mechanism for identified laboratorians. The authors, the State's Laboratory Advisory Committee, and the Department's Cytology Advisory Committee are not sure that these same goals will be met by a cytology PT program based on the published federal cytology PT standards. There is also a strong belief that the federal standards will undergo further amendment. For these reasons, both the authors and the State's advisory committees are urging a wait-and-see approach before the Department modifies its program. Such an approach is practical as it would take from six months to a year to fully modify Maryland's

## When it's time to send in The Special Team.

Here at PSA Financial Center, we utilize a team approach to financial problem solving, and we put together special teams as they are required to deal with special situations.

PSA Professional Liability, Inc., for example, specializes in Medical Malpractice Insurance. Our associates can call upon both in-house staff and outside specialists for their expertise when needed. And because our clients have confidence in our special teams, PSA Professional Liability is now among the largest Malpractice Insurance Agencies in Maryland.

Contact any of our affiliates to enjoy the satisfaction that comes from having a team of financial service specialists working for you.

# When You're Facing Open Heart Surgery, The Last Thing You Should Have To Do Is Wait.

## Announcing the opening of The Heart Center at Sinai.

It's hard to imagine that you might actually have to wait your turn for a serious heart operation. But the fact is that there's a critical shortage of cardiac care facilities in Maryland.

The opening of the new Heart Center at Sinai is helping to alleviate that problem.

One of only four open heart surgery units in the metropolitan area, The Heart Center is a comprehensive, state-of-the-art facility, featuring a 56-bed cardiac unit with two operating rooms, two fully equipped catheterization labs and a Cardiac Surgical Intensive Care Unit. Our staff includes five cardiac surgeons, over 70 cardiologists and dozens of highly skilled cardiovascular nurses and technicians.

We're committed to providing the latest in diagnostic technology and therapeutic intervention. And we're making as many procedures as possible available on an outpatient basis. We also offer counseling and consultation, home care follow-up and a personally tailored rehabilitation program to help you get back to normal living as quickly as possible.

If you'd like more information about The Heart Center, or need a physician referral, give us a call at 578-5435. We're ready and waiting to help.

# Magnetic Resonance Imaging Diagnosis of an Intracranial Metastasis of Adenocarcinoma of the Prostate: Case Report

---

Paul R. Capito MD, Henry Wang MD, Henry Brem MD,  
Hyo S. Ahn MD, and R. Nick Bryan MD, PhD

---

*Drs. Capito, Wang and Bryan are from the Neuroradiology Division, of the Russell H. Morgan Department of Radiology and Radiology Science and Dr. Brem is from the Department of Neurosurgery, Johns Hopkins Medical Institutions, Baltimore. Dr. Ahn is from the Department of Radiology, Sinai Hospital, Baltimore. Reprints: Henry Wang MD, Meyer 8-140, Johns Hopkins Hospital, 600 N. Wolfe St., Baltimore, MD 21205.*

Adenocarcinoma of the prostate is the second most common cancer of American males over age fifty. However, the reported instances of cerebral metastases have been exceedingly rare and are usually diagnosed at postmortem.<sup>1,2</sup> This report describes an unusual case of brain metastasis from an occult adenocarcinoma of the prostate confirmed by craniotomy and tumor resection. The magnetic resonance imaging (MRI) findings of this intracranial metastasis would suggest the importance of MRI vs other imaging techniques in differentiating the type of tumor. A review of the literature is also presented.

## Case Report

A previously healthy sixty-five-year-old man was admitted to the hospital for evaluation of neurologic symptomatology. He presented with a one-month history of ataxia with progressive worsening in gait and an increasing frequency of falls, a two-week history of severe intermittent headaches and drowsiness, and a one-week history of slight dysarthria, intermittent left hemiparesis, and a few episodes of vomiting. The patient was free of any urological symptoms. Physical examination demonstrated tongue deviation to the right, mild left eye ptosis, mild diplopia and nystagmus with right lateral gaze, mild dysmetria, and hyperreflexia of the left side with a positive Babinski on the left.

The patient underwent magnetic resonance imaging (MRI) of the head with and without intravenous gadolinium diethylene triamine pentaacetic acid (Gd-DTPA) contrast injection. The spin-echo pulse sequences T-1 weighted (TR/TE 600/20) [Figure 1], and T-2 weighted (TR/TE 2500/80) [Figure 2] images were obtained from a magnet with a field strength of 1.5 Tesla. A large lobulated lesion was situated posterior to the fourth ventricle involving the inferior and medial portions of the left and right cerebellar hemisphere; edema and mass effect were associated with this lesion. The lesion was hypointense on T-1 weighted images and hyperintense on T-2 weighted images. The posterior and in-

---

**Figure 1.** A large extra-axial mass abutting the inner table of the occipital bone in the posterior fossa; the mass and the involved calvarium display hypointense signals on spin-echo T-1WI.

**Figure 3.** Post contrast (I.V. Gd-DTPA) T-1W coronal MRI shows intense enhancement of the mass lesion and mild enhancement of the diseased occipital bone.

**Figure 2.** Spin-echo T-2W axial head MRI, the posterior fossa mass demonstrates hyperintense signals. The adjacent bone shows expanded diploic space with abnormal signal intensities.

ferior border of this lesion abutted the inner table of the cranium. That portion of the occipital bone overlying the mass lesion had an expanded diploic space with indistinct cortical margin, as well as containing abnor-

mal intensity signals which were low on the T-1 weighted images and slightly high on the T-2 weighted images. Following intravenous (I.V.) Gd-DTPA administration, the lesion in the cerebellum showed abnormal, diffuse, intense enhancement. The involved portion of the skull also demonstrated mild abnormal enhancement (Figure 3).

Computerized tomography (CT) of the head, unenhanced and I.V. enhanced, showed contrast enhancement of the posterior fossa mass lesion. A cerebral angiogram revealed that the mass lesion in the posterior fossa had a dense vascular blush with abnormal, large draining veins. The predominant feeding vessels to this mass arose from the muscular and the posterior meningeal branches of the right vertebral artery. A radionuclide bone scan demonstrated multiple focal areas of abnormal increased uptake of isotopes involving the base of the skull; the first, fourth, and fifth ribs on the left; the shaft of the left humerus; the proximal shaft of the left femur; and the right pedicle of the L-5 vertebral body - a pattern consistent with metastatic cancer. CT of the chest and the abdomen were negative except for the bony metastases. MRI examination of the prostate gland showed a focal lesion in the peripheral zone of the gland on the left side compatible with carcinoma. There was also evidence of capsular penetration and involvement of the left seminal vesicle.

The patient underwent surgery for tumor decompression consisting of a suboccipital craniotomy and C-1 laminectomy with tumor excision of the posterior cranial fossa mass. Upon intraoperative exploration, the bulk of the tumor appeared to be dural-based with minimal extension into the adjacent bone and

parenchyma of the right and left cerebellar hemispheres. Histologic examination of the excised specimen revealed metastatic adenocarcinoma involving the dura, cerebellar tissue, and bone. Immunoperoxidase-staining for prostate specific antigen and prostate acid phosphatase were positive in the tumor. Serum acid phosphatase was within the normal reference range being 0.6 U/L, with a repeated value of 0.4 U/L (normal range is 0.2-0.8 U/L). However, prostatic specific antigen was markedly elevated at 31.5 U/L. A needle biopsy of the prostate yielded a specimen diagnostic for a grade-3 adenocarcinoma of the prostate.

### Discussion

Intracranial metastases from prostatic carcinoma occur very infrequently and are most often found upon autopsy.<sup>2</sup> Prostatic carcinoma is the second most common malignancy found in American males.<sup>3</sup> It most commonly metastasizes to the bone, lungs, and liver, but rarely intracranially to the brain or meninges.<sup>4-6</sup> Much more common than intracranial metastasis from prostatic cancer is metastasis to the cranium or spinal column.

Several autopsy studies and literature reviews on intracranial metastases have been performed. In a review of the literature in 1976, Catane and associates found only nine cases (1.1 percent) of intracranial metastases in 792 autopsied patients with prostatic carcinoma.<sup>7</sup> Chung and Thannikkary reviewed the tumor registry of 1,314 patients with the proven diagnosis of prostatic carcinoma and found that only eight (0.6 percent) of 1,314 patients had intracranial metastases.<sup>4</sup> Two of the patients had metastasis only to the dura. After performing an extensive review of the literature in 1988, Cheng and associates found only thirty reported cases of metastatic prostatic carcinoma to the brain.<sup>3</sup> They found that it was even rarer for prostatic carcinoma to metastasize to the dura and subdural space. In October of 1988, Demierre and Berney of the University Hospital of Geneva, Switzerland reported that among 17,812 brains studied at autopsy over the previous nineteen years, 872 (4.8 percent) were found to have intracranial metastases. Of these, only twenty-one (2.4 percent) stemmed from prostatic carcinoma as the primary. Of the twenty-one cases, twelve involved the dura and only seven involved both the dura and the brain.<sup>8</sup>

Even more rarely does a patient with prostatic cancer present with neurological symptomatology from intracranial metastases prior to presenting with other signs and symptoms caused by the primary prostatic cancer or its metastasis to other more common tissues of the body, e.g., bone. From a review of the literature, only five patients with prostatic carcinoma who presented with neurological symptomatology from intracranial metastases could be found.<sup>2,4,9,10</sup> Therefore, besides the unusual intracranial metastasis of the prostatic carcinoma in our patient, the presentation of the patient neurologically with no signs or symptoms of prostatic disease is extremely uncommon. Signs and symptoms of intracranial metastases most commonly

begin after the diagnosis of prostate cancer is made. Intracranial metastasis of prostatic carcinoma is most often found at autopsy.<sup>2</sup> In this report, MRI was useful in depicting the exact compartment where the tumor was located by virtue of its multiplanar imaging capability. The extra-axial location of the tumor favored the diagnosis of a primary brain tumor such as meningioma or a metastatic neoplasm. The cerebral angiogram confirmed that the blood supply to the tumor was from the extracranial branches of the right vertebral artery, but it did not rule out the possibility of being a meningioma. However, on the MRI, the tumor lacked the tissue characteristics of meningioma which usually has signal intensity isointense to the gray matter of the brain. This lesion had long T-1 and T-2 relaxation time and enhanced intensely after Gd-DTPA injection. The presence of multiple bony lesions on CT and radionuclide studies suggested that the lesion in the posterior fossa could well be another metastatic focus with a large dural component. The involved skull did not show sclerotic changes on CT and plain x-ray, thus metastasis from prostate origin was the least suspected.

It has been postulated that the mechanism by which prostatic cancer metastasizes to the intracranial area may occur directly through the paravertebral venous plexus, avoiding bone and viscera, or as part of a multistep process in which initial metastatic foci in bone or lung metastasize to the brain.<sup>1,2</sup> In our case, the intracranial metastasis represents invasion of the brain from a diploic deposit.

The case reported here is unique, both for the nature of the tumor and for the site of metastasis. The MRI appearance of the metastatic lesion and the application of Gd-DTPA are also illustrated.

Meridian Nursing Center—Heritage

#### ***Partners in Healthcare***

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer’s patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there’s our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—  
The Professional Choice.

### The Omnibus Budget Reconciliation Act of 1990

#### Medicare Issues

**T**he Omnibus Budget Reconciliation Act of 1990 (OBRA-90) was signed by the President on November 5, 1990. As a result of that legislation, some significant changes have occurred with regard to Medicare. The following synopsis highlights several important issues.

#### Anti-Hassle Legislation

With the Senate and House narrowly approving the final budget reconciliation package in October 1990, Medicine was able to claim several major Medicare successes. For example, four of the five elements of the Rowland/Baucus (Representative J. Roy Rowland and Senator Max Baucus) Anti-Hassle Bills (H.R. 4475, S. 2591) were adopted:

1. Reciprocal billing arrangements (cross-coverage billings) are permitted with a maximum limit of sixty days for Medicare, fourteen continuous days for Medicaid, and ninety days for locum tenens.
2. A Practicing Physicians Advisory Council to the Health Care Financing Administration (HCFA) is established. The Secretary of the Department of Health and Human Services (HHS) will appoint fifteen physicians to the Council from nominations submitted by medical organizations representing physicians. Each nominee must have submitted 250 Medicare claims in the previous year. The Council will include participating and non-participating physicians, as well as physicians practicing in rural and underserved urban areas.
3. The Secretary of HHS will conduct a study of the effects of the release of prepayment review screen parameters on physician billing for services to which the parameters apply.
4. The Secretary of HHS will conduct a study in at least four carrier areas on the effects of permitting physicians to aggregate claims denials involving common issues of fact and law, and to make joint appeals for the reversal of the denials to the carrier involved.

The passage of this legislation alleviates some of the regulatory burdens that have been placed on physicians who treat Medicare patients.

#### Medicare Physician Payment Reform

For 1991, the balance billing limits placed on physicians' evaluation and management services will be increased from the current limit of 125 percent of the prevailing charge to the lesser of the updated 1990 MAAC (Maximum Allowable Actual Charge) or 140 percent of the prevailing charge for the service in the locality.

Although the limits on actual charges for 1991 for physicians' services increased, reductions occurred in other aspects of the payment reform. For example, in 1991, primary care services will receive a 2 percent Medicare Economic Index (MEI) update but there will be no MEI update for non-primary care services. In determining the Medicare Volume Performance Standards (MVPS) for surgical services and all other physicians' services for fiscal year 1991, the Secretary's projected baseline rate of growth will be reduced by 2 percent.

Anesthesiologists, radiologists, and pathologists face significant reductions in their Medicare rates. Prevailing charge levels for physician pathology services will be reduced by 7 percent in 1991. Radiologists face a maximum reduction of 9.5 percent below the conversion factor currently applied, while anesthesiologists are looking at a 15 percent maximum reduction. (Radiology or Anesthesiology payments cannot go lower than 60 percent of the national weighted average conversion factor.) Radiologists will also experience a 10 percent drop in payments for magnetic resonance imaging (MRI) and computerized tomography (CT) scans.

Once again, new physicians are targeted for reductions. These reductions will be extended from a two-year phase-in to a four-year phase-in, limiting payments to 80 percent of the prevailing charge ceiling in the first year, 85 percent in the second year, 90 percent in the third year, and 95 percent in the fourth year of practice.

Medicare will limit payments for assistants at surgery to 16 percent of the allowance for the global surgical service. In surgical procedures where an assistant is used less than 5 percent of the time, payment for the assistant will be eliminated.

Under the new law, payment for the technical component for certain high volume diagnostic tests (identified by Medicare officials) will be limited to the average national payment. After 1992, separate payments for the interpretation of electrocardiograms (EKGs) will be eliminated when payment has also been made for a physician visit or consultation.

Prevailing charge levels for previously identified overpriced services will be further reduced in 1991 by the lesser of 15 percent or one-third of the amount they exceed the previously set locally adjusted reduced prevailing amount. For primary care services, however, the prevailing charge floor will be increased from 50 percent to 60 percent. This floor prevents payments for services from falling below 60 percent in any area of the country.

#### Living Wills

While physicians are not required to inform patients about living wills, hospitals, skilled nursing facilities,

HMOs, home health agencies, and hospice programs must maintain written policies and procedures for their adult patients regarding advance directives (living wills or durable power of attorney for health care) as a condition of their provider agreement with Medicare. The providers must:

- a. Provide written information about the patient's rights under state law to accept or refuse treatment and formulate advance directives;
- b. Provide information about the provider's policies regarding implementation of patients' rights and advance directives;
- c. Document in the medical record whether or not the patient has an advance directive;
- d. Ensure compliance with state law concerning advance directives; and
- e. Educate staff and the community on issues concerning advance directives.

It should be noted that providers cannot condition admission or treatment on the basis of the presence or absence of an advance directive.

### **Disclosure Requirements**

Many providers of Part B services, who receive payment on an assignment-related basis, will be affected by the expansion of the disclosure of ownership requirements under OBRA-90. No Part B payment will be made to reporting providers unless they have provided the Secretary of HHS with full and complete information on the identity of each person with an ownership or control interest in the provider or in any subcontractor in which the provider directly or indirectly has a 5 percent or more ownership interest. With respect to any person so disclosed or any managing employee of the provider, information must be provided on the identity of any entities providing items or services with respect to which the disclosed individual or managing employee has had a control or ownership interest at the time such information is supplied or at any time during the three-year period ending on the date the information is supplied. Furthermore, changes or updates in the information must be disclosed no later than 180 days after they take effect. Failure to provide information will be grounds for exclusion from the Medicare program, and criminal penalties will apply for providing false information.

The disclosure requirement will become effective January 1, 1993 for providers who have furnished services paid for under Part B on or before enactment of OBRA-90 or January 1, 1992 for other providers.

### **Clinical Diagnostic Laboratory Tests**

Effective January 1, 1991, the national cap on local laboratory fee schedules will be reduced to 88 percent of the national median from a rate of 93 percent. The

scheduled update for the laboratory fee schedule will be set at 2 percent for 1991, 1992, and 1993. Furthermore, the law is clarified to state that the mandatory assignment requirement for clinical laboratory services also applies to physicians' offices.

Under OBRA-89, physicians were prohibited from referring patients to clinical diagnostic laboratories in which they had a financial relationship. The reporting requirement for ownership arrangements was scheduled to become effective on October 1, 1990. However, OBRA-90 has delayed implementation of the reporting requirement until October 1, 1991. Furthermore, the reporting requirement is amended to require reporting of the names and Unique Physician Identifier Numbers (UPINs) of all physicians with an ownership or investment interest. Additionally, the legislation exempts financial relationships between hospitals and physicians if the relationship does not relate to the provision of clinical laboratory services.

### **Patient Transfers**

When considering allegations of an improper patient transfer, the liability standard to impose civil monetary penalties against a physician has been changed under OBRA-90 from knowingly to negligently. The standard of liability for physician exclusion from Medicare is changed from "knowing and willful or negligent" to "gross and flagrant or is repeated."

### **Physician Payment Review Commission**

The jurisdiction of the Physician Payment Review Commission (PPRC) has been expanded to include the authority to review and make recommendations concerning: physician licensure and certification; options to help constrain the costs of health care to employers including incentives under Medicare; Resource-based Relative Value Scale (RBRVS) implementation issues; physician manpower and graduate medical education costs; policies to provide payment incentives to increase access including policies regarding physician payment under Medicaid; utilization review and the quality of care including the effectiveness of peer review programs, quality assurance programs, and medical malpractice reforms.

### **Medicare Successes**

With all of the budgetary cutbacks, it is sometimes difficult to remember that there were Medicare successes. However, through the efforts of organized medicine, the following victories occurred:

1. Congress rejected Representative Stark's proposal to mandate triplicate prescription programs in all fifty states.
2. The final bill rejected the Administration's proposal to impose a one-dollar charge against physicians for every claim filed non-electronically.

3. The proposal to reimburse non-board certified physicians 5 percent less than certified physicians under Medicare was rejected.
4. Representative Stark's efforts to require periodic Medicare certification of physicians was rejected.
5. The proposal mandating that Physician Review Organizations (PROs) furnish copies of initial sanction notices to licensing boards was defeated.
6. The Uniformed Services University for the Health Sciences will have continued funding and its supervision will be switched to the Secretary of Defense.

### Medicaid Issues

Although much of the focus of the Omnibus Budget Reconciliation Act of 1990 concerned Medicare issues, there also have been significant legislative changes regarding Medicaid. A brief summary of these issues follows.

### Prescription Medications

In order to receive *federal* Medicaid payments for outpatient medications, drug manufacturers must participate in a rebate program, and states must participate in drug use review programs. Under OBRA-90, states are prohibited from maintaining restrictive formularies that would apply to the drug products of manufacturers who participate in the rebate program.

Starting in 1991, a drug manufacturer must agree to provide rebates to every state Medicaid program in order to participate in the rebate program. The amount of the rebate is the difference between the drug's average manufacturer price (AMP) and the lowest price at which the drug is sold (best price). The states will receive the rebate amount for every dose of the medication paid for through the states' Medicaid program. There is an alternative minimum rebate of 12.5 percent for 1991 and 1992, with 15 percent thereafter. There is also a maximum ceiling for the rebate of 25 percent for 1991 and 50 percent for 1992. Generic drug manufacturers must pay a rebate of 10 percent through 1993 and 11 percent thereafter. An additional rebate will be due if the drug manufacturer raises the price of a medication faster than the rate of inflation. Medications not in the rebate program will have federal payment authorized if:

- a. the state has determined the medication is essential to the health of Medicaid beneficiaries;
- b. the drug was rated A-1 by the Food and Drug Administration;
- c. there was approval through a state's prior authorization program; or
- d. the state's determination was reviewed and approved by the Secretary of Health and Human Services (HHS).

While the federal government has conditioned

medication payments on specific criteria, states may have prior authorization programs if they provide a response within twenty-four hours of a request and they provide for the dispensing of at least a seventy-two-hour supply of a requested covered drug in an emergency situation. In certain circumstances, the state Medicaid program can restrict the use of drugs, even those in the rebate program. For example, drug use may be restricted for the following reasons:

1. The medication is not being prescribed for a medically accepted indication.
2. The prescription vitamin and mineral products are not prenatal vitamins or fluoride preparations.
3. The medication is a barbiturate, benzodiazepine, drug efficacy study implementation (DESI) drug, nonprescription drug, or a drug which requires that associated tests or monitoring be purchased exclusively from the manufacturer or its designee.
4. The medication falls into one of the following classes:
  - a. agents used for anorexia or weight gain;
  - b. agents that promote fertility;
  - c. agents used for hair growth or cosmetic purposes;
  - d. agents used for symptomatic relief of cough and colds; and
  - e. agents used to promote smoke cessation.

Also, federal payment will not be authorized for a brand name drug when, under state law, a cheaper generic medication could be substituted.

Furthermore, by 1993, each state must have a drug use review (DUR) program which assures that prescriptions under Medicaid are appropriate, necessary, and not likely to result in any adverse medical problems. The DUR program must include a prospective and retrospective review. It must also establish a DUR Board to carry out the educational component of the program which is aimed at educating practitioners about common drug therapy problems. The DUR Board must consist of at least 33 percent, but no more than 51 percent, licensed and actively practicing physicians. At least 33 percent must be licensed and actively practicing pharmacists. Also, states are being encouraged to establish point-of-sale electronic claims management systems for processing Medicaid drug claims; the federal government will pay 90 percent of the cost of developing a system for 1991 and 1992.

### Unique Physician Identifiers

The Secretary of HHS must have a system by July 1, 1991 that provides for a unique identifier for every physician who furnishes services paid for under a state Medicaid plan. The system *may* be the same as the Medicare UPIN system. Once the identifier system is established, claims will have to include the identifier.

Under the identifier system, no foreign medical

graduate may be issued an identifier unless the individual has:

- a. passed the FMGEMS (foreign medical graduate examination in medical sciences) examinations;
- b. previously received certification from or previously passed the examination of the Educational Commission for Foreign Medical Graduates; or
- c. held a license continuously from one or more states since 1959.

States will also be required to maintain a list of the unique identifiers of all physicians certified to participate under the state plan, and it must be updated monthly.

### Advance Directives

OBRA-90 requires states to have requirements for advance directives (living wills, durable power of attorney) that will be distributed to hospitals, nursing facilities, home health care providers, personal care services, HMOs, and hospice programs receiving Medicaid funds. The requirements for advance directives are basically the same as those required under Medicare. The above-named providers must maintain written policies and procedures regarding advance directives for adult patients, provide these patients with information about the right to formulate advance directives and the right to accept or refuse treatment, document in the medical record whether the patient has an advance directive, and provide for education of staff and the community on issues concerning advance directives. The provision of care cannot be conditioned upon whether or not the patient has an advance directive. Furthermore, state law must be complied with when instituting guidelines regarding advance directives.

Along with these requirements, the Secretary of HHS must develop and implement a national campaign informing the public about advance directives.

### Benefits Related to Pregnancy and First Year of Life

States are required to provide Medicaid benefits for eligible pregnant women throughout pregnancy and for children (born on or after January 1, 1991) for one year after birth, regardless of whether the woman becomes ineligible for benefits because of increased income from employment. The requirement does not apply to a woman who has been provided prenatal care during a *presumptive* eligibility period and is ultimately determined to be Medicaid ineligible.

### Services to Children and Pregnant Women

After January 1, 1992, Medicaid payment will not be

made for physician services provided to a child under twenty-one years of age unless the physician:

- a. is board certified in Family Practice or Pediatrics;
- b. is employed by or affiliated with a federally-qualified health center;
- c. holds admitting privileges at a Medicaid-participating hospital;
- d. is a member of the National Health Service Corps;
- e. documents a current, formal consulting and referral arrangement with a board-certified pediatrician or family practitioner for purposes of specialized treatment and admission to a hospital; or
- f. has been certified by the Secretary of HHS as qualified to provide physician services to a child under twenty-one years of age.

With respect to services provided to pregnant women, Medicaid payment will not be made unless the physician:

- a. is board certified in Family Practice or Obstetrics;
- b. is employed by or affiliated with a federally-qualified health center;
- c. holds admitting privileges at a Medicaid-participating hospital;
- d. is a member of the National Health Service Corps;
- e. documents a current, formal, consultation and referral arrangement with a board-certified obstetrician or family practitioner for purposes of specialized treatment and admission;
- f. has been certified by the Secretary of HHS as qualified to provide physician services to pregnant women.

### Outreach Locations

OBRA-90 provides that federally-qualified health centers are required to provide for the receipt and initial processing of separate applications for medical assistance. The way in which health centers will make provisions for this requirement of the law to be met is vague at this time.

### Conclusion

The total impact of many of these changes will not be known until they have been in effect for a period of time. Therefore, while Med Chi can project the possible impact this legislation will have on physicians' practices, we encourage our membership to keep us informed of their concerns and problems. The responsiveness of our membership helps us to address issues in a timely manner.

ROSEANNE M. MATRICCIANI RN, Esq.  
Assistant Executive Director for Health Care Policy  
Medical and Chirurgical Faculty of Maryland

# MRI UPDATE

Figure 1

Figure 2

**CLINICAL HISTORY:** This is a 26-year-old male with back pain and right lower extremity radiation.

**FINDINGS:** This is an example of a normal study on a young adult. **COMMENT:** MRI is the screening test of first choice for suspected disorders of the lumbar spine. Notice the clear depiction of the normal L5-S1 disc (figure 1, crossed arrow). The discs of this patient exhibit high signal intensity reflecting normal hydration and none of the discs are narrowed. None of the discs indent the thecal sac which is of intermediate signal intensity and appears as the gray band in the center

of the image. The vertebral bodies are homogeneous and free of destructive lesions. The conus medullaris (arrow) is normal. This sagittal image demonstrates the advantages of MRI over other screening modalities. Routine CT scanning will not display the conus medullaris, lesions of which may masquerade as disc herniation. The general area of coverage is superior with MRI. Disc detail is much better displayed with MRI.

The axial image at L5-S1 (figure 2) exhibits delineation of intraspinal detail far superior to that of CT. The right S1 nerve root is clearly displayed (arrow) surrounded by normal perineural fat

which is the bright high intensity material in the periphery of the spinal canal. State-of-the-art MR images clearly display the bony anatomy of the lumbar spine including the facet joints (crossed arrow). Degenerative diseases and bony neoplasm are routinely detectable.

MRI involves no ionizing radiation and no intrathecal contrast material is needed. It is a patient-friendly outpatient examination well suited for screening purposes.

## Board of Physician Quality Assurance Actions

### In the Matter of John L. Flowers MD Before the Maryland Board of Physician Quality Assurance

#### Consent Order

On February 13, 1989, the State Board of Physician Quality Assurance (the Board), pursuant to its authority under *MD Health Occ. Code Ann.*, §14-302 and COMAR 10.32.07, charged John L. Flowers MD (the Respondent) with violations of the Maryland Medical Practice Act (the Act). Specifically, the Board charged Respondent under COMAR 10.31.07.02B(1) and (2)(e), (f), and (i).

The pertinent provisions of COMAR provide as follows:

COMAR 10.31.07.02b(1): After investigation, the Commission may revoke or suspend an unlicensed medical practitioner's right to practice medicine in the State, or place him or her on probation on prescribed conditions or reprimand him or her for any of the causes listed below as unprofessional conduct.

COMAR 10.31.07.02B(2):

- (e) Immoral conduct of the unlicensed medical practitioner in the practice of medicine;
- (f) Practicing medicine other than in connection with the unlicensed medical practitioner's postgraduate training program;
- (i) Willfully making and filing false reports or records in the practice of medicine.

On April 5, 1989, a hearing was held. Respondent; Michael Schatzow, Counsel for Respondent; Debra G. Woodruff, Assistant Attorney General; and Hearing Officer Charles W. Fowler were present at the hearing. The State dismissed the charge of immoral conduct by an unlicensed medical practitioner in the practice of medicine (COMAR 10.31.07.02B(2)(e)). On April 18, 1989, Mr. Fowler issued a Recommended Decision. The Respondent filed exceptions to the Recommended Decision. On June 14, 1989, an exceptions hearing was held before the Board. The Board voted to permit Respondent to return to practice as a resident at the University of Maryland Medical Systems (UMMS) under an agreement between Respondent and UMMS but had not issued a Final Order in Case Number 85-0259.

On November 7, 1989, Respondent submitted an application for a license to practice medicine in Maryland. On June 30, 1990, Respondent completed the General Surgery Residency Program at UMMS. On August 1, 1990, a settlement conference was held to review Respondent's application for licensure and resolve Case Number 89-0259. John D. Stafford MD, Acting Chief of Settlement Conference, and Christine J. Moore attended on behalf of the Board. Also

present were Respondent; Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor; Sylvia J. Williams, Paralegal; Barbara Hull Foster, Assistant Attorney General, Board Counsel; and Virginia A. Guerra, Board Case Manager.

As a result of the evidence presented at the hearing on April 5, 1989, the discussion at the exceptions hearing on June 14, 1989, and materials presented at the conference on August 1, 1990, the Board and the Respondent agreed to enter into this Consent Order which resolves all issues in Case Numbers 89-0259, 89-0290, and 90-0443.

#### Findings of Fact

1. Since July 1, 1984, Respondent has been registered to practice medicine in Maryland at the UMMS in the General Surgery Residency Program, an approved postgraduate training program, pursuant to *MD Health Occ. Code Ann.*, §14-302 (1989 Cum. Supp.)

2. In September 1988, Detective Steven W. Maglidt of the Anne Arundel County Police Department conducted an investigation of prescriptions written in several area pharmacies. The investigation revealed that from November 23, 1985 to October 14, 1988, Respondent wrote prescriptions for Hycodan syrup, a Schedule III narcotic substance; Phendimetrazine (Bontril), a Schedule III non-narcotic substance; Oxycodone (Percocet), a Schedule II narcotic substance; and Vicodin, a Schedule III narcotic substance. Some of these prescriptions were written using fictitious names and some prescriptions were written for Respondent's wife.

3. On October 15, 1988, Respondent was arrested and charged with obtaining controlled dangerous substances by fraud in the *State of MD v John Lee Flowers*, in the Circuit Court for Anne Arundel County.

4. On October 15, 1988 and October 18, 1988, after being advised of his rights, Respondent gave a statement to Detective Maglidt in which he admitted to writing the prescriptions using fictitious names. Respondent admitted that he took the prescriptions to pharmacies where he received the drugs for himself and for his wife.

5. On October 22, 1988, UMMS suspended Respondent from the General Surgery Residency Program as a result of Respondent's arrest. UMMS reported Respondent's suspension to the Board (Case Number 89-0290).

6. On February 13, 1989, the Board charged Respondent with violations of COMAR 10.31.07.02B(2)(e), (f), and (i) in charges under the Maryland Medical Practice Act, attached hereto and incorporated herein as Exhibit A.

7. On May 3, 1989, Respondent received probation before judgment in *State of MD v John Lee Flowers*.

8. On July 1, 1989, UMMS reinstated Respondent in the General Surgery Residency Program. On December 14, 1989, Respondent enrolled in the Employee Assistance Program (EAP) at UMMS.

9. In January 1990, EAP began collecting urine specimens from Respondent.

10. Respondent's urine tested positive for cannabinoid (marijuana) on February 9, 1990; February 15, 1990; and February 26, 1990.

11. On March 7, 1990, UMMS suspended Respondent from patient care duties as a result of the urinalyses which were positive for marijuana as described in paragraph 10. UMMS notified the Board of Respondent's suspension (Case Number 90-0443).

12. From March 19, 1990 through April 2, 1990, Respondent attended the Oakview Residential Treatment Program at Oakview Treatment Center in Baltimore, MD.

13. On April 30, 1990, Respondent signed a Physician Rehabilitation Advocacy Contract with the Committee on Physician Rehabilitation of the Medical and Chirurgical Faculty of Maryland (Med Chi).

14. On May 21, 1990, Respondent signed a Professional Assistance Treatment Contract with UMMS, which provided that EAP would collect random urine samples from Respondent once a week from May 21, 1990 to July 1, 1990.

15. On May 24, 1990, UMMS reinstated Respondent in the General Surgery Residency Program. On June 30, 1990, Respondent completed the five-year General Surgery Residency Program.

16. On June 25, 1990, Respondent signed a Treatment Contract with Whitfield Associates which specifies that Respondent will submit a urine sample once a week.

17. On July 17, 1990, UMMS offered Respondent a position as Endoscopy Fellow in Surgery for a period of one year. The fellowship expires June 30, 1991. Licensure in the State of Maryland is a condition precedent to Respondent's participation in the fellowship.

18. Writing prescriptions for Respondent's wife constitutes practicing medicine other than in connection with Respondent's postgraduate training program.

19. Writing prescriptions using fictitious names in order to obtain drugs for the prescriber's personal use constitutes making and filing false reports or records in the practice of medicine.

### Conclusions Law

Based upon the Findings of Fact, the Board concludes, as a matter of law, that Respondent committed the following prohibited acts:

1. Practicing medicine other than in connection with the unlicensed medical practitioner's postgraduate training program (COMAR 10.31.07.02B(2)(f); and

2. Willfully making and filing false reports or

records in the practice of medicine (COMAR 10.31.07.02B(2)(i)).

### Order

Based on the foregoing Findings of Fact, it is this first day of October 1990, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED that Respondent's application for a license to practice medicine in the State of Maryland is GRANTED and Respondent is placed on PROBATION for a period of five years subject to the following conditions:

1. Respondent agrees to comply with all conditions of his Physician Rehabilitation Advocacy Contract which Respondent signed authorizing the Committee on Physician Rehabilitation of Med Chi to release any and all information to the Board whenever the Board requests any information.

2. Respondent agrees to comply with all conditions of his Professional Assistance Treatment Contract including authorizing the EAP at UMMS to release any and all information to the Board whenever the Board requests any information.

3. Mr. Robert K. White, Director, EAP, will make regular reports to the Board concerning Respondent's participation and submit copies of any and all urine screens. The reports are due October 1, 1990; December 1, 1990; February 1, 1991; and April 1, 1991.

4. Respondent agrees to comply with all conditions of his Treatment Contract with Whitfield Associates including authorizing Whitfield Associates to release any and all information to the Board whenever the Board requests any information.

5. During the period of Respondent's fellowship, Respondent agrees to write orders for controlled dangerous substances, when indicated, for inpatients and patients undergoing endoscopy, on the patients' charts.

6. During the period of Respondent's fellowship, Respondent agrees that he will not prescribe controlled dangerous substances for any individual, including outpatients, patients discharged from the hospital, himself, and his wife. In addition, Respondent agrees that he will not apply to the United States Drug Enforcement Administration (DEA) for a DEA Registration Number or the Maryland Division of Drug Control for a CDC Registration Certificate.

7. During the period of Respondent's fellowship, Respondent's supervisors will be Anthony Imbembo MD, Chief of the Department of Surgery; Carl Zucker MD; Robert Bailey MD; and Scott Graham MD. Drs. Imbembo, Zucker, Bailey, and Graham agree to report to the Board immediately if they believe Respondent is a danger to himself or to others, or that

he has used any drug or controlled dangerous substance.

8. Respondent shall continue to attend Narcotics Anonymous at least three times a week.

9. Beginning October 1, 1990, Respondent will give two supervised urine specimens per week on Mondays and Thursdays at 2:00 p.m. Respondent shall pay to Mr. White the amount of twenty dollars each time a urine specimen is collected on Mondays and Thursdays of each week for the duration of the protocol to cover the cost of performing each urine drug-screening test. In addition, the Respondent will pay twenty dollars to cover the cost of performing the secondary confirmatory test whenever a urine drug-screen test result is positive.

10. In the event that Respondent wishes to take a vacation or plans to leave the State of Maryland, Respondent must notify the Board of his intent in writing, at least one month prior to the vacation, using certified mail, return receipt requested. Respondent must arrange for supervised urine-testing twice a week at a facility approved by Mr. White whenever he leaves Baltimore. All vacations must be within the continental United States and either the Board, the Executive Committee, or the Monday Review Panel Committee must approve Respondent's request in advance.

11. In the event of an emergency which requires Respondent to be out of town, he must telephone J. Michael Compton, Acting Executive Director; Margaret T. Anzalone, Deputy Director; or Israel H. Weiner MD. After Respondent notifies one of the three persons mentioned, Respondent must send a letter to the Board, certified mail, return receipt requested, explaining the reasons for the emergency.

12. Respondent agrees that he will be responsible for all costs incurred under this Consent Order.

13. Respondent shall not violate any provisions of *MD Health Occ. Code Ann.* §§14-504 (1989 Cum. Supp.).

14. On or about June 1, 1991, Respondent will meet with representatives of the Board to discuss his future plans. At that time, any of these conditions of probation may be modified. This Order may continue in effect for five years, and it is further

ORDERED that if Respondent violates any of the conditions of probation specified by this Order, the Board will SUMMARILY SUSPEND Respondent's license. Within thirty days of the suspension, the Board will afford Respondent an opportunity for a hearing before the next regularly scheduled Board meeting; and it is further

ORDERED that this is a Final Order and as such is considered a public document pursuant to *MD State Govt. Code Ann.*, §§10-611.

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

## Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of twelve pages.

1. By signing this Consent, I hereby submit to this Order and its conditions.

2. I understand that if I fail to comply with the conditions set forth in this Order, the Board will revoke my license to practice medicine.

3. I am not represented by counsel at this time, but I understand both the nature of the matters against me and also this Consent Order fully. I make this decision voluntarily and knowingly.

JOHN L. FLOWERS MD

## Exhibit A

In the Matter of  
John Lee Flowers MD  
Before the  
Maryland Board of  
Physician Quality Assurance

### Charges Under the Maryland Medical Practice Act

Based on information received by the Maryland Board of Physician Quality Assurance (the Board), the Board hereby charges John Lee Flowers MD (the Respondent), under COMAR 10.31.07.02b(1) and (2)(e), (2)(f), and (2)(i).

The pertinent provisions of COMAR under which Respondent is charged provide as follows:

COMAR 10.31.07.02 B(1): After investigation, the Commission may revoke or suspend an unlicensed medical practitioner's right to practice medicine in the State, or place him or her on probation on prescribed conditions or reprimand him or her for any of the causes listed below as unprofessional conduct.

COMAR 10.31.07.02 B(2):

- (e) Immoral conduct of the unlicensed medical practitioner in the practice of medicine;
- (f) Practicing medicine other than in connection with the unlicensed medical practitioner's postgraduate training;
- (i) Willfully making and filing false reports or records in the practice of medicine.

The above disciplinary action is subject to COMAR 10.31.07.02C which provides that the Board may take disciplinary action only after a formal hearing at a regular or special meeting of the Board with a quorum of the Board members present and voting.

### Allegations of Fact

The Board bases its charges on the following facts that the Board has cause to believe are true:

1. Respondent is an unlicensed medical practitioner who is authorized to practice medicine in Maryland pursuant to *MD Health Occ. Code Ann.*, §14-302 (1988 Cum. Supp.). Pursuant to §14-302, the Board adopted regulations governing the practice of unlicensed medical practitioners.

2. COMAR 10.32.07.04 requires that the Chief of Service of the institution providing the postgraduate training program register each unlicensed medical school graduate with the Board.

3. The UMMS registered Respondent in its residency program in

General Surgery on or about July 1, 1984. Respondent continued in the residency program until he was suspended on October 22, 1988.

4. In September 1988, Detective Steven W. Maglidt of the Anne Arundel County Police Department conducted an audit of prescriptions written by Respondent and filed in the following pharmacies:

- a. Rite Aid, 7456 Ritchie Hwy., Glen Burnie
- b. Rite Aid, 312 Hospital Dr., Glen Burnie
- c. Rite Aid, Old Mill Rd. and MD Rt. 3, Millersville
- d. Revco, 661 Old Mill Rd., Millersville
- e. Giant, 7383 Baltimore-Annapolis Blvd., Glen Burnie
- f. Giant, 7940 Crain Hwy., Glen Burnie
- g. Giant, 6626 Ritchie Hwy., Glen Burnie
- h. Giant, 7927 Ritchie Highway, Glen Burnie
- i. Giant, 551 Ritchie Hwy., Glen Burnie

5. The audit revealed that Respondent wrote 129 prescriptions for Bontril, Valium, Tenuate, Hycodan, Soma Compound with Codeine, Vicodin, Percocet, and Oxycodone/Acetaminophen to Cindy Lyons, Cindy Daukantas, Mae Daukantas, Chris Buckley, Frank Fontaine, Jeffrey Shipley, Jeff Shipley, and Diane Buckley between November 23, 1985 and October 14, 1988.

6. On October 15 and 18, 1988, after being advised of his rights, Respondent gave statements to Detective Steven W. Maglidt, admitting that Jeff Shipley, Frank Fontaine, and Chris Buckley did not exist. When Respondent wrote prescriptions in the names of either Jeff Shipley, Frank Fontaine, or Chris Buckley, Respondent took the prescriptions to a pharmacy where he received the drugs for his personal use.

7. Respondent admitted that the purpose of writing prescriptions with the false names was to obtain drugs for "recreational" use.

8. Writing prescriptions for patients who do not exist and taking the prescription to a pharmacy where Respondent received the drugs constitutes willfully making and filing false records in the practice of medicine.

9. Writing prescriptions for patients who do not exist constitutes immoral conduct in the practice of medicine.

10. Respondent's wife is Cindy Daukantis Lyons. Respondent admitted to treating his wife for chronic bronchitis, low back pain, and weight control.

11. Respondent admitted that both he and his wife used Bontril, Hycodan, Percocet, and Vicodin for "recreational" use.

12. Writing prescriptions for Respondent's wife constitutes practicing medicine other than in connection with Respondent's postgraduate training program.

#### Notice of Possible Sanctions

If after a hearing, the Board finds the above allegations of facts to be true, the Board may revoke or suspend Respondent's right to practice medicine in the State or place Respondent on probation or reprimand Respondent.

#### Notice of Hearing, Pre-hearing Conference, and Settlement Conference

A hearing in this matter has been scheduled for April 5, 1988 at 10:00 a.m. in the Office of Administrative Hearings and Appeals, the O'Connor Building, 201 West Preston St., Baltimore, MD.

In addition, a settlement conference in this matter has been scheduled for March 8, 1989 at 12:00 p.m. in the O'Connor Building, Baltimore, MD, and a pre-hearing conference in this matter has been scheduled for March 22, 1989 at 9:00 a.m. in the Office of Administrative Hearings and Appeals, the O'Connor Building, Baltimore, MD. The nature and purpose of the settlement conference and the pre-hearing conference is described in a letter to the Respondent.

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

## In the Matter of Mark Davis MD Before the Maryland Board of Physician Quality Assurance

### Order for Summary Suspension of License to Practice Medicine

The Maryland Board of Physician Quality Assurance (the Board) herein sets forth the following background information as pertinent to this Order for Summary Suspension (the Emergency Suspension) with regard to the license of Mark Davis MD (the Respondent) to practice medicine in the State of Maryland:

1. Respondent is a physician licensed to practice medicine in the State of Maryland.

2. On October 24, 1990, the Board voted to summarily suspend Respondent's license to practice medicine in Maryland.

3. The Board's determination to summarily suspend Respondent's license was based upon the following information:

- a) Physician services deficiencies at Dukeland Nursing Home where Respondent was medical director and attending physician for certain patients.
- b) Interim Report (the Interim Report) of the Medical and Chirurgical Faculty Peer Review Committee (Med Chi PRC) dated July 2, 1990 which "concluded that there is evidence of instances of inappropriate care in [Respondent's] Dukeland Nursing Home practice..." and recommended an office practice review.\*
- c) Physician services deficiencies at Poplar Manor Nursing Home where Respondent is owner, medical director, and attending physician for all 157 patients.
- d) Report of practice review from Med Chi PRC dated October 3, 1990 (the October Report) which "concluded that there is evidence of instances of inappropriate care in [Respondent's] Dukeland Nursing Home practice, that [Respondent's] nursing home care, in general, is superficial at best, and that the outpatient care provided by [Respondent] is substandard for the practice of Internal Medicine."\*
- e) Report dated February 7, 1990 from Liberty Medical Center regarding continued restrictions on Respondent's privileges as a "result of a series of grossly negligent and substandard acts."

\* Health Occupations Article §14.602 and §14-601 require that reports of Med Chi PRC and a medical review committee be kept confidential and they are nondisclosable. Therefore, this report is not part of this public order but is included with Respondent's copy of the Summary Suspension.

f) Report dated October 17, 1990 from Meridian-Caton Manor Nursing Center revoking Respondent's privileges as attending physician because Respondent had not visited his patients since July 1990.

4. Based on information received by the Board, Respondent has a private office practice located at 9141 Baltimore National Pike. Respondent's practice is in the area of general Internal Medicine. In his private practice, Respondent sees approximately two to six patients weekly. Respondent has been engaged in the private practice of Internal Medicine since July 1981.

5. Based on information received by the Board, Respondent has privileges at Poplar Manor Nursing Home, Northwest Nursing Home, Armacost Nursing Home, Bon Secours Extended Care Facility, Liberty Medical Center, Bon Secours Hospital, Maryland General Hospital, and Howard County General Hospital. In addition, Respondent practices at certain domiciliary care facilities.

6. The majority of Respondent's practice involves treating patients in nursing homes. Based upon information received by the Board, Respondent has under his care 300 nursing home patients including twenty-nine patients at Northwest Nursing and Convalescent Center and 157 patients at Poplar Manor Nursing Home. Respondent also treats several patients in domiciliary care homes.

7. Beginning in February 1989, Respondent came under Board investigation in connection with his activities as medical director and attending physician at Dukeland Nursing Home.

8. As a result of a survey conducted May 24 to May 30, 1989 by the Office of Licensing and Certification (L&C), numerous deficiencies in the area of physician services were discovered. In particular, life-threatening deficiencies in the area of physician services were discovered with respect to Resident Nos. 88-067 and 87-021 for which Respondent was the attending physician. With respect to Resident 88-067, L&C found that Respondent had failed to assess an acute change in the patient's condition (elevated blood pressure). With respect to Resident No. 87-021, L&C found that Respondent had failed to note that a urine culture and sensitivity ordered on April 1, 1989 had not been performed as of May 30, 1989.

9. On or about July 2, 1990, Med Chi PRC reported "several instances that reflect serious consequences to [patients] as a result of reviews conducted of twenty patient charts at Dukeland Nursing Home." In general, the Interim Report found:

Each record [review] included a physical examination form which is a usual part of a nursing home record; however, the form for almost all patients was exactly the same. Skin sheets (nursing reports) included in each record were also uniform. The monthly notes consisted of a check-off list with no variation from one to the other, giving the appearance that physical contact was not made.

10. In the Interim Report, one peer reviewer noted as follows:

... progress notes are virtually 'pro forma.' They provide no interval information regarding the patient's status, include a perfunctory examination, no specific comments regarding laboratory information, and no indication of further treatment plan. There is no indication that the chart record has been reviewed, and there is never any comment regarding the interval problems [which may have been] experienced since the previous examination. Several of the charts reveal patients to have been hospitalized in the interim, and readmitted to the facility, without comment by [Respondent] as to the nature of the hospitalization or any interval note with respect to the diagnoses or treatment plans requiring adjustment as a result of this hospitalization.

The physician's orders are almost always telephone orders countersigned by the physician including the initial admission orders in every case. On several occasions, the [Respondent] saw the patient several days after admission to the facility.

Referring specifically to the requirements for a chart review as provided by the Peer Review Committee, I would summarize these requirements as they apply to all of these medical records as stating that in virtually every category, [Respondent's] records must be rated as inadequate. Legibility is variable, and the record does not allow for a rapid determination of the current medical status of the patient...

11. On September 18, 1990, a review of Respondent's office practice was conducted by Med Chi PRC. The conclusions are set forth in the October Report. The findings are consistent with the problems found at Dukeland Nursing Home. Specifically, the October Report found:

...that the randomly selected office records were difficult to read, poorly organized and reflected a lack of identification of patient problems...

An additional concern is the fact that [Respondent] has instructed hospitals not to provide them with any information (history, physical examination, pathology report, radiology report, etc.) concerning his patients' hospitalization. He stated that it is not his policy to accept this material nor his desire to maintain his files...

[Respondent] does not do any health maintenance procedures whatsoever, including performing true, comprehensive history and physical examinations and mammography for his female patients, and routine screening with sigmoidoscopy or stools for occult blood...

[Respondent] does not make any effort to maintain communication with referring or consulting physicians. He indicated that he does not contact previous treating physicians when their patients are admitted to his care at local hospitals; he does not feel that he has an obligation to follow patients seen in consultation beyond the need for immediate pre- and post-operative care when the patient is hospitalized; nor does he feel it is his responsibility to make sure that there is ongoing continuity of care for the medical problems of such patients when they are discharged.

12. On October 17, 1990, Poplar Manor Nursing Home was notified regarding several physician deficiencies at the facility. Respondent is owner, medical director, and attending physician for all 157 patients at Poplar Manor. Specifically, L&C found

that the following physician services requirements had not been met:

The facility has not provided for physician services that meet the residents' needs in providing for a total plan that includes maintaining physical function status and medication management of residents.

The [Respondent] has not supervised the residents' care in order to maintain or improve their highest practicable mental or physical function.

[With respect to Resident No 00738], physician services are deficient for continuing to prescribe a dose of Dilantin which had been demonstrated recently to be toxic.

[With respect to Resident No. 1786], physician services are deficient for not responding to an acute respiratory problem in a timely manner.

[With respect to Resident No. 1886], the [Respondent] failed to order Dilantin for a resident whom he believed clearly required it for approximately four weeks.

[With respect to Resident No. 1886], physician services are deficient for failure, on two occasions, to order Dilantin for a patient, who the [Respondent] obviously thinks requires it.

[With respect to Resident No. 1886], physician services are deficient for not ordering, for four days, insulin, for a brittle diabetic.

[With respect to Resident No. 1079], the [Respondent] was contacted and increased the Dilantin dose to 375 milligrams per day, a 150 percent increase from his previous dose. This order was started on July 1; there was no order to monitor the Dilantin level. On July 17, seventeen days after the Dilantin dose was increased by 150 percent, the resident developed lethargy and was hospitalized with Dilantin toxicity. Physician services are deficient for dramatically increasing Dilantin dose without monitoring the level.

[With respect to Resident No. 1886], physician services are deficient in not following up on a dangerously high serum potassium level for eight days.

[With respect to Resident No. 1915], physician services are deficient in that when the physician ordered serum electrolytes on July 23 for this resident known to develop hypokalemia in the past, it was his responsibility to determine the results of the test.

The above physician services deficiencies are not exhaustive of the findings from the L&C survey of Poplar Manor.

13. The cumulative information received by the Board since commencing its investigation of Respondent demonstrates that Respondent is not practicing in accordance with the accepted standards of an internist. In particular, the October Report and the finding of physician services deficiencies at Poplar Manor for the period October 2 to October 16, 1990, support the Board's finding that the public health, safety, or welfare imperatively require emergency action.

14. The Findings of Fact below set forth the deficiencies in care for specific patients which lead to the conclusion that the public health, safety, or welfare imperatively require emergency action.

### Findings of Fact

1. Based upon all the information received by the

Board in connection with its investigation including, but not limited to, the background information set forth above and incorporated herein, the Exhibits, and instances described in Paragraph 2 below, the Board has reason to believe that the following facts are true.

2. Respondent's treatment of his patients demonstrates a failure to meet the standard of care, unprofessional conduct, and professional incompetence in the following instances:

*Patient One:* On August 3, 1987, patient one was transferred from Liberty Medical Center where she was treated for syncope and urinary tract infection to Dukeland Nursing Home (Dukeland). Respondent was the patient's attending physician at Dukeland.

On August 5, 1987, Respondent completed a one-page standardized history and physical examination form. Respondent failed to note that the patient had a Foley catheter in place. In response to the category marked "skin (decubitus?)," Respondent wrote "see skin sheet." The skin sheet revealed a stage II decubitus ulcer on the left foot. On August 10, 1987, Respondent requested a surgical consultation for debridement of necrotic tissue on the left foot. On August 11, 1987, the skin sheet revealed a second decubitus ulcer, classified as stage II, on the inner aspect of the left foot. On August 12, 1987, Respondent completed a standardized progress note and described the skin condition as "good" despite the presence of two stage II decubitus ulcers. In order to write a progress note, a physician must examine the patient. It is apparent that Respondent failed to perform a physical examination before he completed the progress note because he described the skin condition as "good" when a physical examination would have revealed that the patient had two decubitus ulcers.

On August 6, 1987, a urinalysis report revealed white cells too numerous to count and heavy buddy yeast. Respondent failed to comment about the urinalysis results in the progress notes.

On August 11, 1987, Respondent was notified that the patient was unresponsive. On August 17, 1987, Respondent was notified that the patient's temperature was 100 degrees. Respondent ordered Tylenol 1 tablet when necessary for temperature above 100 degrees. On August 23, 1987 at 1:00 p.m., the patient was unresponsive; blood pressure was 40/20; the pulse was 70 and irregular; and the respirations were 18. Sometime later on August 23, 1987, the patient's temperature was 100 degrees. At 6:00 p.m., respirations were "slightly dyspneic" and the patient's color was fair. On August 24, 1987, the patient's temperature rose to 101.6 degrees. Respondent ordered Tylenol 2 tablets but did not appreciate the seriousness of the patient's symptoms in light of the patient's past medical history. Based on the patient's history of a urinary tract infection in the hospital, an untreated urinary tract infection at Dukeland, a recent hypotensive episode, and two instances of unresponsiveness,

the standard of care required Respondent to transfer the patient to an emergency room. Respondent failed to transfer the patient to an emergency room.

*Patient Two:* On September 14, 1988, patient two was transferred from St. Agnes Hospital where he was treated for hyponatremia to Dukeland. The patient had a history of seizures and hypertension, and was diagnosed as having chronic obstructive pulmonary disease (COPD). The patient was discharged from St. Agnes on the following medications:

Theragram 1 tablet every day;  
Theodur 300 mg three times a day;  
Catapres 0.1 mg three times a day; and  
Dilantin 100 mg three times a day.

On September 15, 1988, Respondent completed a one-page standardized history and physical examination form. On September 16, 1988, laboratory results revealed:

- a) red blood count of 3.39 (norm 4.4 to 6.0);
- b) hemoglobin 9.8 (norm 13.5 to 17.5);
- c) hematocrit 30.2 (norm 40 to 53);
- d) Dilantin level 8.4 mg/L (range 10 to 20); and
- e) Theophylline level 9.8 mg/L (range 5 to 20).

Respondent did not respond to the subtherapeutic Dilantin level until October 19, 1988 when he increased the Dilantin to 400 mg per day. Respondent failed to order a Dilantin level within one week after increasing the dose. Respondent's failure to order a Dilantin level in a timely manner resulted in a toxic Dilantin level of 33 on November 11, 1988.

Respondent failed to comment in the progress notes about the patient's abnormal red blood count, hemoglobin, and hematocrit values of September 16, 1988. Upon discharge from St. Agnes, the hematocrit was 35.7. The September 16, 1988 hematocrit of 30.2 represented a significant decrease which Respondent ignored. Respondent did not order a hemoglobin and hematocrit until December 20, 1988 which was too late under the circumstances. In addition, Respondent failed to order any diagnostic tests to determine the cause of the anemia. Respondent failed to order stools for occult blood.

On March 10, 1989, the Theophylline level was 2.5 which is less than therapeutic. On March 23, 1989, Respondent ordered a Theophylline level and discontinued the Theophylline. The results of the last Theophylline level are not in the chart. Respondent did not indicate why he discontinued the Theophylline. Since the patient had been diagnosed as having COPD, there is no indication to discontinue the Theophylline.

On March 26, 1989 at 3:00 p.m., the patient was sweating profusely and was short of breath; the blood pressures were 200/80 (right arm) and 220/100 (left arm). At 12:00 p.m., when the blood pressures were 200/110 (right arm) and 190/100 (left arm), the nurse called Respondent. At 1:15 p.m., Respondent ordered Lasix 40 mg. Respondent's treatment was below the

standard of care. The patient should have been sent to the emergency room. Respondent failed to recognize this medical emergency. Respondent failed to give instructions about monitoring the patient. Respondent failed to examine the patient. Respondent failed to ensure that his patient was attended to by another qualified physician in his absence. Respondent failed to have the patient transferred to a hospital emergency room when the patient's symptoms required immediate intervention. The patient died at 9:40 p.m.

Despite the patient's previous hospitalization in September 1988 for hyponatremia, Respondent failed to check the patient's sodium while the patient was at Dukeland. It is below the standard of care for the attending physician to fail to followup on a patient's problems which required a prior hospitalization.

*Patient Three:* Patient three sought treatment from Respondent at Respondent's office on May 10, 1988. The first note in the medical record is dated June 16, 1989 which indicated that Respondent ordered a refill of a prescription for Tetracycline. There is no indication why Respondent prescribed Tetracycline.

The chart does not contain a comprehensive history and physical examination.

Laboratory reports in the chart indicate that Respondent ordered blood tests on 7/7/88, 12/6/88, 4/11/89, and 8/22/89. Respondent failed to comment about any laboratory results in his progress notes.

There are several notes in the record from another physician who prescribed Calan-SR and Vasotec. There is no indication that Respondent followed the physician's treatment plan or advised the patient otherwise. Respondent failed to coordinate the patient's care with the other physician.

Respondent's failure to obtain a complete medical history, to conduct a complete physical examination, to coordinate the patient's care with other treating physicians, and to document his treatment of the patient all indicate that the care rendered by Respondent was below the standard of care.

*Patient Four:* Patient four sought treatment from Respondent at Respondent's office on February 14, 1990. Respondent failed to perform a comprehensive history and physical examination. Respondent noted that the patient had a history of seizures for twenty years and had been on Tegretol therapy. There is no further information about her seizure history; the date of her last seizure is important to make a decision whether Tegretol therapy should be continued. Respondent failed to order a Tegretol level before continuing the patient on Tegretol.

On February 14, 1990, Respondent ordered a complete blood count (CBC). The laboratory results showed:

white blood count - 32. (norm 4.3 to 10.5);  
granulocytes - 28 (norm 40 to 80); and  
atypical lymphocytes - 8 (norm 0 to 4).

On February 22, 1990, the date of the next office visit, Respondent failed to comment about the low white blood count which was potentially life-threatening. There is no indication that Respondent was aware that Tegretol can cause pancytopenia. *The Physicians' Desk Reference*, 1989 edition, cautions:

...complete pre-treatment hematological testing should be obtained as a baseline. If a patient in the course of treatment exhibits low or decreased white blood cell or platelet counts, the patient should be monitored closely. Discontinuation of the drug should be considered if any evidence of significant bone marrow depression develops.

Respondent failed to monitor the patient's blood count when he did not order serial CBCs.

On April 18, 1990, Respondent cleared the patient for cataract surgery "if lab normal." Respondent abrogated his responsibility for the patient's care by failing to alert the surgeon to the patient's abnormal lab results.

*Patient Five:* Patient five was transferred from Liberty Medical Center where she was treated for an infected stage III decubitus ulcer of the right heel to Dukeland on February 9, 1989. At the time of her transfer, she was receiving Coumadin 2.5 mg daily.

On February 9, 1989, Respondent completed a one-page standardized history and physical examination form. Respondent failed to indicate why the patient was receiving Coumadin. Respondent did not contact the patient's physicians at Liberty Medical Center to question the order for Coumadin or the previous coagulation studies. It is apparent from the history and physical that Respondent ordered Coumadin based on another physician's determination.

On February 10, 1989, the prothrombin time was 13.3 seconds with a control of 11.8 seconds for a ratio of 1.1. There is no indication in the progress notes to show that Respondent adjusted the Coumadin dose to achieve a level within the therapeutic range. There is no indication why Respondent selected a lower range than is customary.

*Patient Six:* Patient six was transferred from Liberty Medical Center (LMC) where he was treated for unresponsiveness, dehydration, and sepsis to Poplar Manor Nursing Home (Poplar Manor) on April 19, 1990. Upon discharge from LMC, the patient was receiving, among other medications, Dilantin 200 mg per day. On May 3, 1990, the Dilantin level was 12 (therapeutic 10 to 20). On July 16, 1990, the Dilantin level was 3.5 which is below the therapeutic level. According to the nurse's notes, on July 18, 1990, Respondent did the following:

ordered Dilantin 200 mg stat;  
discontinued Dilantin 100 mg bid;  
ordered Dilantin 100 mg tid; and  
ordered a Dilantin level in two weeks.

Respondent should have repeated the Dilantin level

immediately to verify the accuracy of the 3.5 level and ordered a Dilantin level within a few days to assess whether the serum level rose to a therapeutic level based on the increased dose. Respondent's failure to monitor the Dilantin level led to the patient's transfer to the emergency room at Maryland General Hospital (MGH) on July 27, 1990 for Dilantin toxicity. On admission to MGH, the Dilantin level was 32.2. The emergency room physician ordered: "No Dilantin until Sunday, then only 100 mg bid." The patient returned to Poplar Manor on July 28, 1990 and Respondent ordered Dilantin in accordance with the emergency room physician's plan.

However, on August 1, 1990, Respondent ordered Dilantin 300 mg per day, a dose which had caused toxicity only six days earlier. Respondent continued to prescribe Dilantin 300 mg per day until a surveyor questioned the dosage. Respondent should have ordered a Dilantin level within one week after the patient returned to Poplar Manor on July 28, 1990 and assessed the efficacy of his treatment plan. Respondent did not order a Dilantin level until October 4, 1990. Respondent's failure to monitor the Dilantin level subjected the patient to a toxic level of Dilantin for thirty-nine days as evidenced by the Dilantin level of 21 on October 5, 1990.

Respondent's monthly progress note dated August 2, 1990 did not refer to the reason for the patient's recent hospitalization except to comment that the "Dilantin levels in the hospital were very satble [sic]." In addition, Respondent noted that the "Dilantin level was 3.2" when the level was 32.2.

Respondent's monthly progress note dated August 2, 1990 is typewritten and pasted over an entry handwritten by Respondent and dated August 20, 1990. If Respondent did not see the patient until August 20, 1990 as the handwritten entry indicated, Respondent failed to provide appropriate care to the patient. Respondent should have examined the patient when Respondent assumed responsibility for the patient's care on July 28, 1990 after the patient was hospitalized. If Respondent's note dated August 20, 1990 was written on the wrong patient, Respondent should have lined through the entry, labeled it "ERROR" and signed his name. It is below the standard of care to alter a medical chart in such a manner that the observer cannot read an entry.

*Patient Seven:* Patient seven was admitted to Poplar Manor in December 1989 with the diagnoses of diabetes, schizophrenia, dementia, and an enucleated left eye. The patient was hospitalized from May 13, 1990 to May 31, 1990 to rule out a cerebrovascular accident. While hospitalized, the patient received Dilantin. The hospital discharge summary states:

EEG showed diffuse encephalopathy of moderate degree. This patient was observed to have muscle activity and also she has extensive infarct. It was decided to put the patient on Dilantin and the dosage was adjusted carefully. The Dilantin

level on 5/23 was 16.8. The one on 5/30 is still pending. If there is any change on 5/30/90, we will inform the nursing home.

Upon readmission to Poplar Manor on 5/31/90, Respondent failed to order Dilantin for the patient who had a history of seizures. On June 27, 1990 at 2:00 p.m., Respondent ordered Dilantin 400 mg immediately and at 12:00 a.m., to be followed by Dilantin 300 mg per day. Respondent ordered a Dilantin level in one week. By prescribing a loading dose to achieve a rapid serum level of Dilantin, Respondent acknowledged the potential for seizures. It is below the standard of care to fail to order Dilantin for four weeks for a patient who had been receiving Dilantin.

On July 8, 1990, the patient was transferred to Liberty Medical Center for atrial fibrillation with rapid ventricular response and hypoglycemia (glucose 26). Respondent's admission note revealed the following information:

Physical Examination: Her pupils are sluggish, but reactive. She has bilateral arcus senilis...

Arcus senilis is a ring of depigmentation around the iris of the eye found in many elderly people. The patient's left eye had been removed; she had an artificial left eye. An "arcus senilis" may have been painted on the prosthesis for cosmetic purposes; however, an artificial eye does not react to light. If Respondent had examined the left eye, he would have found it was enucleated. Respondent failed to examine the patient's eyes prior to dictating the admission notes.

On July 13, 1990, the Dilantin level was 27 (therapeutic 10 to 20); on July 5, 1990, the Dilantin level was 19. The patient returned to Poplar Manor on July 17, 1990. Respondent telephonically ordered Dilantin 200 mg per day and a Dilantin level every three months. Respondent should have ordered a Dilantin level within one week after the patient returned to Poplar Manor.

The patient's chart contains a Pharmacy Recommendation Sheet. On August 11, 1990, the pharmacist noted:

Dilantin toxic in hospital (7/13);  
dose lowered;  
suggest repeat level.

Respondent did not order a Dilantin level as suggested but maintained the patient on Dilantin 200 mg per day.

Respondent did not perform a history and physical when the patient was readmitted to Poplar Manor on July 17, 1990; Respondent did not write a progress note until August 20, 1990. Respondent's failure to examine the patient until thirty-four days after he assumed responsibility for the patient is below the standard of care.

On August 30, 1990, the serum potassium was 6.2 (norm 3.7 to 5.3). Respondent ordered a stat repeat potassium level but it was not performed until eight days later on September 9, 1990. A high potassium

level can cause cardiac arrhythmias and death. Respondent failed to treat this medical emergency. When the patient was admitted to Liberty Medical Center on September 10, 1990 after being found lethargic and unresponsive, Respondent failed to alert the hospital physician of the patient's hyperkalemia because Respondent did not record this episode in his admission note.

The patient, readmitted to Poplar Manor on September 25, 1990 at 1:00 p.m., had a history of recent hospitalization for hypoglycemia. (The patient was transferred to Maryland General Hospital emergency room on June 2, 1990 for evaluation of hypoglycemia.) Respondent failed to order insulin. On September 27, 1990 at 6:20 p.m., the patient's glucose level was 425 (norm 65 to 115). Respondent ordered ten units of Regular insulin. At 10:00 p.m., a chemstick revealed a glucose level of 240. Respondent ordered five units of Regular insulin and a fasting blood sugar (FBS) in the morning. On September 28, 1990, the patient's glucose level was 118. Respondent did not order insulin on September 28, 1990. On September 29, 1990, at 10:00 p.m., the glucose level was 438. Respondent ordered five units of Regular insulin immediately and daily. Respondent failed to order insulin for a brittle diabetic upon admission to Poplar Manor and on a regular basis until four days later, during which time the patient suffered three known episodes of hyperglycemia. Hyperglycemia can cause death.

Respondent failed to perform a history and physical examination upon the patient's readmission to Poplar Manor on September 25, 1990. Respondent did not write a progress note until October 2, 1990. Respondent failed to order Dilantin on September 25, 1990. On October 10, 1990, the Pharmacy Recommendation Sheet indicates that the pharmacist noted: "Readmitted 9/25, Dilantin not on admission order."

On October 14, 1990, Respondent wrote: "no seizure, off Dilantin." If Respondent planned to discontinue the Dilantin on September 25, 1990, Respondent should have instructed the nursing staff to monitor the patient for seizure activity. Respondent did not discuss his plan to discontinue Dilantin in the progress note dated October 2, 1990. Respondent failed to comment about the patient's lack of seizure activity in the progress note on October 2, 1990.

*Patient Eight:* Patient eight was transferred from Maryland General Hospital (MGH), where she was treated for rectal and vaginal bleeding, to Poplar Manor on January 2, 1990. Past medical history included diagnoses of cervical cancer and anemia. The patient was fed via a gastrostomy tube.

On July 19, 1990, the nurse's note described the patient as alert and awake. No changes in the patient's status were noted until July 25, 1990 at 2:00 p.m. when the patient became lethargic. At 10:00 p.m., the patient continued to be lethargic but responded to tactile stimulus. On July 26, 1990 at 1:00 a.m., the

patient "responded slowly" to verbal and tactile stimulus. Vital signs were recorded as:

Temperature	100.9 degrees;
Pulse	64;
Respiration	18; and
Blood pressure	140/80.

At 2:00 a.m., the patient's temperature rose to 101.6 degrees. At 2:20 a.m., Respondent telephonically ordered Tylenol for temperature above 100 degrees and advised continued observation. Tylenol was given at 2:25 a.m. At 5:00 or 6:00 a.m., the patient's temperature was 101 degrees. Tylenol was given. The patient remained lethargic and her skin was hot and dry. At 8:15 a.m., the vital signs were recorded as:

Temperature	101.2 degrees;
Pulse	102; and
Respiration	22.

A minute amount of yellow phlegm was suctioned. At 10:15 a.m., patient's temperature was 100.8 degrees, pulse was 142, and respirations were 22. At 10:30 a.m., Tylenol was given. At 12:00 p.m., the vital signs were recorded as:

Temperature	100.8 degrees;
Pulse	70;
Respiration	20; and
Blood pressure	148/70.

At 2:00 p.m., Tylenol was given. At 6:00 a.m., on July 27, 1990, the vital signs were recorded as:

Temperature	102;
Pulse	76;
Respiration	20; and
Blood pressure	118/84.

At 10:00 a.m., Tylenol was given for a temperature of 101.6 degrees (rectally). At 12:00 p.m., putrid yellowish material with a foul odor was suctioned. The temperature was 101 degrees (rectally). At 1:00 p.m., Respondent telephonically ordered that the patient be transferred to the emergency room for evaluation. Based on the patient's clinical symptoms of lethargy, an elevated temperature which did not respond to Tylenol, a tachycardiac pulse, and yellow foul-smelling secretions, Respondent should have sent the patient to the emergency room within twelve hours after the change in the patient's condition. Respondent failed to appreciate the seriousness of the patient's condition because he did not examine the patient within twelve hours after the change in the patient's condition. The symptoms of elevated temperature, rapid pulse, and thick secretions suggest pneumonia which is a common cause of death in the elderly population.

Patient eight remained at Liberty Medical Center until August 10, 1990 when she was readmitted to Poplar Manor. The patient remained at Poplar Manor from August 10, 1990 until September 6, 1990. However, a typewritten progress note dated August 16, 1990 and signed by Respondent on August 21, 1990 states:

patient in hospital at this time;  
transfer summary and discharge summary to follow on patient return on August 17, 1990.

It is obvious that Respondent did not examine the patient prior to dictating and signing the progress note because the patient remained at Poplar Manor from August 10, 1990 until September 6, 1990. It is below the standard of care to write a progress note without examining the patient. Respondent's note demonstrates that he did not know where his patient was on August 16, 1990.

On September 5, 1990 at 9:25 p.m., the nurse's note indicates:

suctioned for third time;  
experiencing SOB [shortness of breath];  
VS 118/60, 100.2 degrees - 100 (irregular) - 49

The nurse administered oxygen and called Respondent. Respondent did not initiate a treatment plan. The increased pulse and respiration indicated an acute change in the patient's condition. Respondent did not initiate a treatment plan. The standard of care requires a physician to perform a physical assessment immediately, since Respondent had not seen the patient since July 19, 1990. At 10:21 p.m., the nurse's note indicates that the patient was "lying in bed and cont [continued] to have labored breathing." At 11:30 p.m., the patient was sent to Liberty Medical Center where the patient was diagnosed as having renal failure, respiratory failure, and right lower lobe pneumonia. Respondent failed to act in a timely manner, failed to examine the patient, and failed to send the patient to the emergency room as soon as he was aware of the acute change in the patient's condition.

*Patient Nine:* Patient nine sought treatment from Respondent at Respondent's office on January 12, 1988. The chart does not contain a comprehensive history and physical examination. There is no detailed past medical history. There is no reason why the patient sought treatment. The first entry in the chart is: "HBP [high blood pressure] Diabetes." The only vital sign recorded is a blood pressure reading. Respondent lists four medications: Diabinese, Aldomet, Chlorthalidone, and Synthroid. Respondent's failure to formulate a treatment plan makes it impossible to ascertain whether the patient had been taking these drugs or whether Respondent made a decision to prescribe them. There is nothing to suggest Synthroid was indicated. Respondent failed to order thyroid function tests (TFTs) to establish a diagnosis of hypothyroidism. Respondent ordered TFTs twelve months after prescribing Synthroid. It is below the standard of care to prescribe a slow-acting thyroid medication such as Synthroid and wait twelve months before ordering laboratory tests to assess the efficacy of the treatment.

On August 10, 1989, lab results revealed the following:

Triglyceride	427	(range 20 to 190)
Thyroxin	<0.6	(range 4.5 to 11.5)
R-T3 uptake	26.87	(range 25 to 39)
Free Thyroxin Index (T7)	<0.2	(range 1.1 to 4.5)

On August 15, 1989, Respondent noted: "Synthroid needed" and ordered "0.25 x 2 today then 0.25 qd [everyday]." Since Synthroid is a slow-acting drug; it is not used to treat hypothyroidism on an emergency basis. Respondent's prescription of two Synthroid tablets in this situation reveals that Respondent failed to appreciate the severity of the clinical symptoms. Respondent endangered the patient's life by failing to address this situation. Since the patient refused an endocrinology consultation, Respondent should have monitored TFTs every two weeks and followed the patient closely.

Laboratory results in the chart reveal the following results:

Date	Glucose
1/12/88	158
3/3/88	172
9/27/88	179
12/20/88	227
3/21/89	236
4/18/89	196
6/20/89	164
8/10/89	195
9/12/89	277
12/5/89	151
6/19/90	141

Despite the elevated blood sugars (range 65 to 115), Respondent failed to discuss the findings in the progress notes or to assess the adequacy of his treatment plan.

Respondent did not recommend any screening studies despite his treatment of the patient for two and one-half years.

*Patient Ten:* Patient ten was transferred from Liberty Medical Center (Liberty), where he was treated for dehydration, a urinary tract infection, and uncontrolled diabetes, to Dukeland Nursing Home on February 20, 1987. At Liberty, the patient had been receiving twelve units of NPH insulin daily. On February 20, 1987, Respondent telephonically ordered twenty-five units of NPH insulin daily and fasting blood sugars (FBS) monthly. On February 22, 1987, Respondent completed a one-page standardized form but he failed to perform a comprehensive history and physical examination. In addition, Respondent failed to discuss why he increased the insulin dose. The standard of care requires Respondent to check the FBS within twenty-four hours of changing the insulin dose. Respondent's failure to monitor the FBS more than once a month caused a dangerously low FBS on March 10, 1987 of 42 (norm 65 to 115).

On March 11, 1987, the patient was transferred to Liberty for a hypoglycemic reaction secondary to insulin therapy. When the patient returned on March 25, 1987, Respondent failed to formulate a treatment

plan to prevent a similar occurrence. Respondent did not order insulin. Respondent failed to indicate why he decided to treat the patient without insulin. Respondent ordered an FBS every three months. Based on the patient's history and recent hospitalization, Respondent should have monitored the patient's glucose level on a weekly basis to assess whether the FBS increased without insulin.

An undated urinalysis reveals that there were white cells too numerous to count. A review of the physician's orders and the progress notes failed to show a response by Respondent to the abnormal urinalysis, such as a culture or an order for antibiotics. In light of the patient's history of urinary tract infections, Respondent should have initiated appropriate treatment or commented why treatment was not provided.

On March 22, 1989, the patient was admitted to Maryland General Hospital for dehydration, gastrointestinal bleeding, and to rule out urinary tract infection. While hospitalized, the patient had a positive culture for acid-fast bacilli. According to the nurse's notes in response to a recommendation by a physician from Maryland General Hospital on August 2, 1990, Respondent telephonically ordered Rifampin, Pyrazinamide, and a sputum culture in two weeks. Respondent failed to comment in the progress notes why he initiated this treatment. Respondent failed to appreciate the patient's symptoms and perform a physical examination.

On August 4, 1989, the patient was transferred to Maryland General Hospital for treatment of pneumonia.

*Patient Eleven:* Patient eleven first sought treatment from Respondent in Respondent's office on June 2, 1982. The first note in the chart is dated December 10, 1987. Respondent continued to see the patient through October 4, 1990.

Respondent failed to perform a comprehensive history and physical examination during the eight years he saw the patient. A review of the progress notes reveals that Respondent did not assess the patient's symptoms and formulate a treatment plan. Accordingly, Respondent did not provide continuity of care despite the patient's regular visits to Respondent. There are no follow-up plans noted in the record.

Respondent failed to recommend standard screening examinations, such as mammography, stools for occult blood, and sigmoidoscopy.

The Respondent's overall medical management of this patient did not meet the standard of care for a treating physician.

*Patient Twelve:* Patient twelve was transferred from Maryland General Hospital, where he was treated for sepsis, pneumonia, urinary tract infection, and dehydration, to Dukeland Nursing Home (Dukeland) on March 4, 1988. Respondent completed a standardized one-page history and physical examination

form in which he listed the above-mentioned diagnoses and included the diagnosis of seizure disorder. Respondent failed to order Dilantin or explain his treatment approach. On March 7, 1988, the patient had a grand mal seizure. The nurse's note reveals that Respondent saw the patient and stated: "if the patient experiences another seizure activity, call me for possible placement back on Dilantin medication treatment." Respondent failed to document his examination and assessment of the patient in the progress note. The next progress note, dated March 21, 1988, does not refer to the seizure activity.

On July 16, 1986, the patient had another grand mal seizure. Respondent ordered Dilantin 300 mg daily. A Dilantin level was not drawn until July 23, 1988 when the level was 9.3 which is less than the therapeutic value of 10 to 20. Respondent should have ordered a Dilantin level to be drawn within forty-eight hours after therapy was initiated in order to evaluate the blood level of Dilantin and prevent another seizure. A Dilantin level on August 2, 1988 was within the therapeutic range. Respondent failed to order another Dilantin level during the remainder of the patient's stay at the nursing home through December 2, 1988.

On December 9, 1988, the Dilantin level was less than 2.5. On December 9, 1988 and December 14, 1988, Respondent discontinued the Dilantin. On January 12, 1989, the patient had a seizure. Respondent ordered Dilantin medication and a Dilantin level to be drawn in two days. On January 14, 1989, the level was within therapeutic range. Respondent failed to order another Dilantin level prior to the patient's transfer to another nursing home on February 22, 1989.

Respondent's failure to monitor the Dilantin level is below the standard of care for a physician who prescribes Dilantin to a patient who had recently experienced three seizures.

*Patient Thirteen:* Patient thirteen was transferred from Liberty Medical Center, where she was treated for recurrent decubitus ulcers, to Dukeland Nursing Home on March 2, 1988.

Respondent completed a one-page standardized history and physical examination form in which Respondent listed the patient's chief complaint as status post flap. In response to the category labeled "skin," Respondent wrote: "see skin sheet."

The skin sheet shows the location of five decubitus ulcers on March 2, 1988. However, in a progress note, Respondent described the skin condition as "good." In order to write a progress note dated March 21, 1988, a physician must examine the patient. It is apparent that Respondent failed to perform a physical examination before he completed the progress note because he described the skin condition as "good" when a physical examination would have revealed that the patient had five decubitus ulcers. Respondent failed to comment in the progress note about the sacral flap which had become infected, and the remaining decubitus ulcers.

*Patient Fourteen:* Patient fourteen was admitted to Poplar Manor on November 16, 1989 with diagnoses of anemia and congestive heart failure. On April 5, 1990, the patient received a pacemaker. On October 1, 1990, a pacemaker check indicated that the pacemaker was functioning properly. However, on October 20, 1990 at 3:40 a.m., the patient "was holding chest as if in pain or some discomfort." The patient's vital signs were recorded as follows:

Temperature	99 degrees (rectally);
Pulse	80 irregular;
Respiration	28; and
Blood pressure	140/70.

At 4:11 a.m., the patient was transferred to Liberty Medical Center where she was evaluated. The emergency room physician's impressions noted shortness of breath, and ruled out congestive heart failure. The patient's pulse fluctuated between 82 and 101. The patient was placed on oxygen. An electrocardiogram (ECG) revealed the following information:

undetermined rhythm;  
left axis deviation;  
nonspecific intraventricular block;  
cannot rule out anteroseptal infarct, age undetermined;  
T wave abnormality, consider lateral ischemia; and  
abnormal ECG.

Respondent disagreed with the emergency room physician's assessment and wrote the following information on the emergency room record:

she didn't have CHF;  
SOB anxiety syndrome;  
possible bronchospasm; and  
chronic fatigue.

Respondent transferred the patient to Poplar Manor at 10:45 a.m. According to the nurse's note, no additional orders were written.

Despite the patient's symptoms and the ECG results, Respondent failed to instruct the nursing staff at Poplar Manor to monitor the patient closely. Respondent should have ordered that no rectal temperature be taken. Respondent's impression of bronchospasm is not supported by the patient's clinical picture. Bronchospasm does not cause pain.

There is no objective data to support Respondent's impression of anxiety syndrome. It is unclear from the record whether Respondent saw the patient at the emergency room or at the nursing home. However, Respondent did not record the results of a physical examination performed at either location in the record.

According to the patient's chart, there were no nursing notes written on this patient from October 27, 1990 at 2:00 p.m. until the patient stopped breathing on October 30, 1990 at 3:10 p.m. In addition, there are no progress notes.

Respondent's failure to obtain a complete medical history, to conduct a complete physical examination, to coordinate the patient's care with other treating

physicians, and to document his treatment of the patient all indicate that the care rendered by Respondent was below the standard of care.

3. On November 2, 1990 at 11:00 a.m., Respondent was notified of the Board's vote to summarily suspend his license and given an opportunity to surrender his license before the close of business on November 2, 1990, in lieu of the Board's execution of the Order for Summary Suspension.

4. Respondent's retention of a license to practice medicine in Maryland and his ability to continue to treat patients poses a grave risk and imminent danger to the public health, safety, and welfare of the citizens of the State of Maryland.

5. In several instances, as mentioned in Paragraph 2 above, Respondent demonstrated an inability to comprehend the importance of documenting and interpreting significant laboratory results.

6. Respondent subjected his patients to unnecessary risks by failing to prescribe drug therapies which were indicated by the patient's clinical picture.

7. Respondent posed a grave risk to his patients in several instances, as mentioned in Paragraph 2 above, when he failed to respond appropriately to emergency situations.

8. Respondent's inability and/or unwillingness to appropriately manage his patient's drug therapies represents a grave risk and imminent danger to his patients. On several occasions, as documented in Paragraph 2 above, Respondent mismanaged the treatment of patients for whom he prescribed Theophylline, Coumadin, Tegretol, Dilantin, Insulin, and Synthroid.

Based upon the above information, the Board has reason to believe that Respondent has violated *MD Health Occ. Code Ann.*, §§14-504(a)(3), (4), and (22) (1990 Cum. Supp.).

The pertinent provisions of §14-504(a) provide:

- (a) Subject to the hearing provisions of §14-505 of the subtitles, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licenses on probation, or suspend or revoke a license if the licensee:

- (3) Is guilty of immoral or unprofessional conduct in the practice of medicine;
- (4) Is professionally, physically, or mentally incompetent; or
- (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical... care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

### Conclusions of Law

Based upon the foregoing facts, the Board finds that the public health, safety, and welfare imperatively require emergency action in this case, pursuant to *Maryland State Government Annotated Code* §10-405(b) (1984).

### Order

It is this second day of November 1990 by the Maryland Board of Physician Quality Assurance:

ORDERED that pursuant to the authority vested in the Board by the *MD State Govt. Code Ann.*, §10-405(b) (1984), Respondent's license to practice medicine in the State of Maryland is hereby SUMMARILY SUSPENDED; and be it further

ORDERED that on presentation of this ORDER, Respondent shall immediately deliver or have delivered to the Board:

- (1) his original Maryland license from the Board of Medical Examiners;
- (2) his renewal card for his license to practice medicine from the Board of Physician Quality Assurance;
- (3) his U.S. Drug Enforcement Administration Registration Certificate;
- (4) his Maryland Controlled Dangerous Substances Certificate; and
- (5) any prescription pads on which his name and DEA number are imprinted;

ORDERED that a copy of the Order shall be filed with the Board in accordance with *MD Health Occ. Code Ann.*, §14-507(d) (1989 Cum. Supp.)

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

## March is Music In Our Schools Month

March has been designated as Music In Our Schools Month by the Music Educators National Conference. During this time, children, teachers, parents, community leaders, and music lovers everywhere celebrate the importance of music. The theme for 1991 is "A World in Tune," which highlights the global impact of music and its universality to the human experience.

The centerpiece of the celebration is the World's Largest Concert, to be broadcast over PBS stations Thursday, March 7, from 1:00 to 1:30 p.m. The concert will originate from Walt Disney World's EPCOT Center and be hosted by Grammy Award winner, Marilyn McCoo. Organizers hope to break last year's record of more than eight million participants in this televised sing-along.

Med Chi's Music Medicine Clearinghouse Committee is arranging a viewing of the concert for interested members, staff, and friends. For further information, please contact Susan Harman, Clearinghouse Coordinator, at 301-539-0872.

### The Patient's Advocate

I am tired of hearing everyone claim to be the "patient's advocate." Medicare claims it. The Blues claim it. Many HMOs claim it. Several hospitals claim it. Victor Cohn claims it. Other consumer advocates claim it. I suspect even the Board of Physician Quality Assurance claims it.

Not true, folks.

The word advocate comes from the Latin *advocatus*: "a counselor" (which stems from *ad vocare*: "to call"). The word patient is derived from the Latin *pati*: "to endure." It is cognate with *passio*: "a suffering" - which ultimately derives from the Greek *pathos*. A "patient's advocate" gives counsel to one who suffers - to one who has called.

I am the one called. At three in the afternoon or three in the morning I am at his side. I ask the probing questions, observe the subtlety of facial expression, auscult the faint aortic diastolic whiff, palpate the soft barely enlarged spleen, anticipate the grave diagnosis, order the confirmatory test, begin the relevant therapy. I am the one who agonizes over his failure to respond, I am the one who spends hours interpreting clinical findings, educating the family and anguishing with them.

And in the end, I am the last to surrender him to his God.

I am the patient's advocate.

I am his sword and his shield.

I am the ultimate, definitive, exhaustive, and irrevocable advocate for his life.

I am his physician.

Those others are all pretenders to the title.

### Medical Advertising

Medical advertising in the *Yellow Pages* with reference to the Baltimore metropolitan area was the subject of a Commentary in this journal in June 1988.<sup>1</sup> The review unearthed that evidence of certification could not be found for 103 of 316 (32.6 percent) of the doctors who claimed specialization, perhaps with the tacit suggestion that they might be board certified.

Med Chi subsequently formed a Committee on Specialist Identification to review the allegations of all doctors proclaiming specialist status. The resolution of this problem was expected to be difficult. Judgment, moreover, hinged upon the assumption that a difference does not really exist between board certification and specialist as defined by the State.

The Maryland Medical Practice Act, in *Health Occupations Article*, §14-704, Specialists, reads "A physician may not represent to the public that the physician is a specialist in any field of specialized medical practice unless identified as a specialist in that field by the Board."<sup>2</sup> The Board of Physician Quality Assurance (BPQA) could, if necessary, define the qualifications of the physician seeking specialist status. One of the criteria was representation to the public in an ethical manner that the applicant was a specialist before July 1, 1984.

A review of the current *Yellow Pages*,<sup>3</sup> the *Directory of Medical Specialists*,<sup>4</sup> its supplement,<sup>5</sup> and the *American Medical Directory*<sup>6</sup> was made. A total of 749 individuals was encountered who were specialists or who limited their practices: 579 (73.3 percent) were certified and 170 (27.7 percent) were not. A slight lowering of the non-certified group from the previous review was noted but the statistics were essentially the same.

A patient expecting certification in this group would have been misled. A physician who may have failed his/her certification examination but has been in the specialty since before 1984 may well be allowed to advertise as a specialist. The Committee on Specialist Identification should have knowledge of whether the non-certified doctor has attempted specialty board examinations and if failure resulted. Such an individual should not be granted specialty status. The Committee will have to find a sorely-needed solution to this problem. If they do not, the Board of Trustees at the individual hospital may have to pass judgment upon who may be a specialist. This action would be far removed from the original intention of having Specialty Boards make such decisions.

As long as the physician does not use the word "specialist," the BPQA cannot interfere with the advertising. The implication may still exist, however, if the doctor states that a restriction of practice to a particular specialty exists.

The Committee on Specialist Identification, concerned with the problem, faces another legal obstacle. Does an invasion of privacy occur if the Committee asks the advertising "specialist" if specialty boards have

been taken and the result of such examinations? In such situations, the candidate may relate that he/she is board eligible. Such a status does not exist as the doctor has either passed the boards or not. If medicine must have quality assurance, the place to start is with the physician.

### Commentary: Medical Advertising

The Maryland General Assembly has established that a physician's license may be suspended or revoked if the physician advertises in violation of rules and regulations of the Board of Physician Quality Assurance.<sup>1</sup> Board regulations require a physician to be identified by the Board as a specialist in a particular specialty before the physician may represent to the public that he or she "is specializing in any practice of medicine or limiting the physician's practice of medicine to any specialty."<sup>2</sup> In order to be identified as a specialist, a physician *must* apply to the Board of Physician Quality Assurance.

A physician who is certified by a specialty board approved by the American Board of Medical Specialties or who has "fulfilled the requirements to attain eligibility to take" a specialty board examination, may be identified directly by the Board of Physician Quality Assurance as a specialist.<sup>3</sup> If a specialty does not have a residency training requirement or a board examination, or if the physician has not taken an available full residency program, he or she may still be identified by the Board of Physician Quality Assurance as a specialist on the recommendation of the Board's medical review committee.<sup>4</sup>

### Lyme Disease

The July 1990 issue of the *Maryland Medical Journal* printed a letter written by me the previous January. That letter is in need of an update.

The letter raised two main issues. The first was to alert physicians that Lyme patients may have negative serologies. The second was to suggest treatments for the disease. Dr. John Bartlett, Chief of the Division of Infectious Diseases at Johns Hopkins University, responded to my letter in the same issue.

After attending the 1990 National Lyme Borreliosis Scientific Symposium held by the Lyme Borreliosis Foundation in cooperation with the University of Miami School of Medicine, and now with recent knowledge of the work by Rocky Mountain Labs (Dr. Willy Burgdorfer's lab), my letter needs to be strengthened.

The symposium was a two-day conference where twenty-seven physicians and researchers in the field of Lyme borreliosis presented their ideas. Approximately 200 physicians and other researchers attended.

The sections on diagnostic testing showed an urgent need to develop new diagnostic tests. The current serological tests only demonstrate whether a patient has diagnostic antibodies to the antigen employed in that test. Antigens employed with these tests are not stable, nor are they tested against a bank of control sera, as the latter has not been developed. Different strains of *B. burgdorferi* exist and patients may not be tested against the strain that infected them. The Western Blot is not a gold standard as it too suffers from these same problems. When one researcher asked another how dark a band had to be on the Western Blot to be diagnostic and the other replied he xeroxed the results, and if a band showed up on the copy it was there, we readily realized this was not the answer.

Admitted by a number of experts was the general feeling that antibiotic use will lead to negative serologic tests. A paper included in the symposium material summarized these points and the concern that *B. burgdorferi* may be immunosuppressive contributing to seronegative patients.<sup>1</sup> Additional work by this same individual as well as another suggests a seronegativity rate of about 50 percent.<sup>2,3</sup>

The urine antigen tests have been criticized for their false positive results, but were defended with the following study. Two groups of patients not thought to have Lyme borreliosis were tested by the Dianon and 3M urine antigen tests. With the Dianon test, three of sixty negative controls tested positive. On review of these three patients, two had symptoms suspicious of Lyme borreliosis and one of these two had a positive serologic test. With the 3M test, two of fifty negative controls tested positive. The concern with the urine test is that known Lyme patients can have negative

urine tests. Advocates of the urine tests recognize that antibiotic use will depress values into a negative range.

Rocky Mountains Labs is currently working on a urine antigen test which shows promise in identifying active *B. burgdorferi* infection despite antibiotic use, with no chance of false positives. As an antigen test, antibody production by the patient is not required. This test has been positive in patients with negative serologic and conventional urine antigen tests.<sup>4</sup>

Treatment courses vastly different from those in the *Medical Letter* cited by Dr. Bartlett, and at much higher doses than my letter, were recommended.

Intravenous penicillin was not recommended as treatment for late stages not only because culture and sensitivity results showed a number of American and European isolates were resistant to penicillin (e.g., minimum inhibitory concentration (MIC) for penicillin G averaged 17.5, where that of ceftriaxone was 0.08) but also because penicillin does not penetrate the central nervous system well. Preferred treatments in addition to ceftriaxone were cefotaxime (MIC 0.5), and intravenous ampicillin (MIC not done).

Oral treatment of choice was amoxicillin for children, and amoxicillin with probenecid for adults. The MIC for amoxicillin averaged 1.5. Doxycycline, commonly used by many, has a MIC averaging 3.3 but may be inferior to amoxicillin due to its bacteriostatic nature. Not even Steere recommends the use of doxycycline as the first choice treatment in late stage Lyme borreliosis.<sup>5</sup>

The dose of amoxicillin proposed for adults by one physician at the symposium was 1,000 mg tid in combination with 500 mg probenecid tid. The average length of treatment with this regimen was four months in uncomplicated late stage patients. His published paper is worth close consideration.<sup>6</sup>

To aid physicians in the diagnosis and treatment of Lyme borreliosis at this time, I have assembled a forty-page handbook which consists of Maryland State Health Department information, Wisconsin State Health Department material, and information from the symposium. An advertisement for this handbook appears in the classified section of this issue.

### Commentary: Lyme Disease

There is nearly uniform agreement in the field that better diagnostic tests for Lyme disease are needed. The usual tests for most commercial labs are the ELISA or the indirect fluorescence assay (IFA). Neither test has been standardized, the antigens used differ, and the cut point for positive results vary. Especially disconcerting is the interlaboratory and intra-laboratory variations noted with the current diagnostic kits that are commercially available.<sup>1</sup> Nevertheless, the rate of false-negatives remains low according to most authorities in the field unless the test is done too early in the disease course and in occasional cases where early therapy seems to interfere with the usual serologic response. False positive tests may also be noted including cross reactions in other spirochetal diseases, especially syphilis.

With regard to treatment, there is certainly no unanimously accepted regimen. The previously cited guideline from the *Medical Letter*<sup>2</sup> represents a consensus statement of authorities in the field based on available data including controlled clinical trials. I am not aware of published data or clinical trials that would refute these recommendations. These also represent the therapeutic recommendations in the review of the

topic in the *State of Maryland, Communicable Diseases Bulletin* for April 1990. The antibiotic recommendations noted by Dr. Feaga include regimens that, to my knowledge, do not have verified merit based on systematic study, nor have they been published in peer-reviewed journals.

On the basis of the observations noted above, my recommendations to physicians in Maryland would be judicious use of serology for detection of *B. burgdorferi* with the understanding that it should be used only to confirm a diagnosis based on epidemiologic and clinical observations, that the test may be falsely negative when the serum is obtained too early in the disease (as with any serologic test), and there are likely to be an unacceptably large number of false-positive tests when testing patients with a low probability of this infection. The decision to treat should be made on the basis of clinical observations and the predictive value of the diagnostic test. With a negative test, I recommend treatment only if the clinical evidence is strong and there was antibiotic treatment during the stage of erythema chronicum migrans. Many patients have vague neuro-logic or rheumatologic complaints with a negative test and, in my view, should not be treated. When the decision is to treat, the regimens used should be those recommended by acknowledged authorities in the field as previously described.<sup>2</sup> Alternative regimens should supplant these recommendations when properly controlled therapeutic trials demonstrate superiority.

### LYME HANDBOOK

Clinical manifestations, diagnosis and current & proposed treatment. 40 pgs. Send \$8 payable to *LYME HANDBOOK*, c/o MD Lyme Support Group, 13151 Triadelphia Rd., Ellicott City, MD 21043.

### MMJ Classified Advertising

*Med Chi Members:*  
\$5 per line per insertion

*Nonmembers:*  
\$8 per line, minimum \$50 per ad

Please submit copy seven weeks prior to the first day of the month in which you wish the ad to run. Items will be related to the practice of medicine. Ads placed for the benefit of a hospital or an HMO will be billed at the nonmember rate. Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physician's practice or equipment.

### OFFICE EQUIPMENT FOR SALE

1 wall mount otoscope, Welch; 1 EKG machine automatic, 12 lead, portable, Bricher, 4 yrs old; 1 blood pressure wall mounted (trim line); 1 centrifuge, clay adams; 1 TITMUS vision test; Medi fast software (office practice); x-ray film viewer; 2 treatment tables. Info: P.O. Box 2161, Hagerstown, MD 21740.

## Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degrees, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles.

Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both the principal author and **MMJ**.

\* \* \*

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

# Enter the Eleventh Annual Med Chi Photo Contest

**Enter early!**

*Deadline for entries is April 19, 1991 ■  
Two categories: Black & White or Color ■  
Open to all Med Chi and Auxiliary Members*

■ *First and Second Prizes Awarded in Each Category* ■ *All Photographs will be displayed at the 1991 Annual Meeting at College Park.*

## *Med Chi Photo Contest Rules*

**Eligibility:** All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

### *Contest Rules:*

1. Photographs may be submitted in two categories: black and white or color.
2. Limit: three entries per person.
3. Prints only, no smaller than 8 X 10 or larger than 11 X 14, will be accepted. If your favorite shot is a slide, you must have a print made to enter in the contest within these size ranges.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name, address, and telephone number attached to the back of each photograph.
6. Entries may be mailed or brought to the Faculty Office, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on April 19.
7. Photographs entered in the contest will be on display at the Annual Meeting in May of 1991.
8. Prizes will be awarded to the first and second place winners. Additional information about the prizes will be published in the Journal.
9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, May 8-11, 1991.
10. Photographs will not be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual meeting at noon on May 11, or at the Faculty Building thereafter.
11. The Faculty does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

# Commitment and Service Since 1975

The *Med Chi Agency* was established by the Medical and Chirurgical Faculty in 1975 and now has over 5,000 physicians and employees as clients.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial products. You will benefit from the many coverages available for both your professional and personal needs. You will also benefit indirectly, because Med Chi owns the *Med Chi Agency* and the earnings from its operations.

For complete information about any insurance product or service, just give us a call. We can provide the answers you seek and the solutions you need.

# Why buy an office automation system that doesn't offer a long-term solution?

## ACCLAIM<sup>TM</sup> from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

### **IBM® and compatible hardware.**

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

### **Long-term support.**

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people

are always there to make sure your system fits your needs over the years to come.

### **Easy to operate.**

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

## TETANUS PROPHYLAXIS IN WOUND MANAGEMENT

A thorough attempt must be made to determine whether a patient has completed primary immunization. Patients with unknown or uncertain previous immunization histories should be considered to have had no previous tetanus toxoid doses. Persons who had military service since 1941 can be considered to have received at least one dose; although most may have completed a primary series of tetanus toxoid, this cannot be assumed for each individual. Patients who have not completed a primary series may require tetanus toxoid and passive immunization at the time of wound cleaning and debridement (Table 1).

Available evidence indicates that complete primary immunization with tetanus toxoid provides long-lasting protection--10 years or more in most recipients. Consequently, after complete primary tetanus immunization, boosters--even for wound management--need to be given only every 10 years when wounds are minor and uncontaminated. For other wounds, a booster is appropriate if the patient has not received tetanus toxoid within the preceding 5 years. Antitoxin antibodies develop rapidly in persons who have previously received at least two doses of tetanus toxoid. Tetanus-diphtheria (Td) is the preferred preparation for active tetanus immunization in wound management of patients 7 years old or older. This is to enhance diphtheria protection, since a large proportion of adults are

susceptible. Thus, by taking advantage of acute health-care visits, such as for wound management, some patients can be protected who otherwise would remain susceptible. For routine wound management of children under 7 years old who are not adequately immunized, diphtheria-tetanus-pertussis (DTP) should be used instead of single-antigen tetanus toxoid. If pertussis vaccine is contraindicated or individual circumstances are such that potential febrile reactions following DTP might confound the management of the patient, DT may be used. For inadequately immunized patients of all ages, completion of primary vaccination at the time of discharge or at follow-up visits should be ensured. (Tables 1 and 2).

If passive immunization is needed, human TIG is the product of choice. It provides longer protection than antitoxin of animal origin and causes few adverse reactions. The currently recommended prophylactic dose of TIG for wounds of average severity is 250 units IM. When tetanus toxoid and TIG are given concurrently, separate syringes and separate sites should be used. The ACIP recommends the use of only adsorbed toxoid in this situation.

*Reference: MMWR 1985;34:422.*

Table 1. Summary guide to tetanus prophylaxis in routine wound management--United States, 1985

History of adsorbed tetanus toxoid (doses)	Clean, minor wounds		All other wounds*	
	Td@	TIG	Td@	TIG
Unknown or < three	Yes	No	Yes	Yes
≥ three#	No**	No	No##	No

\*Such as, but not limited to, wounds contaminated with dirt, feces, soil, saliva, etc.; puncture wounds; avulsions; and wounds resulting from missiles, crushing, burns and frostbite.

@For children under 7 years old, DTP (DT, if pertussis vaccine is contraindicated) is preferred to tetanus toxoid alone. For persons 7 years and older, Td is preferred to tetanus toxoid alone.

#If only three doses of fluid toxoid have been received, a fourth dose of toxoid, preferably an adsorbed toxoid, should be given.

\*\*Yes, if more than 10 years since last dose.

##Yes, if more than 5 years since last dose. (More frequent boosters are not needed and can accentuate side effects.)

## MARYLAND RABIES 1990

Laboratory confirmed animal rabies increased by 81 or 20.8% over 1989 (468/389). This is the third consecutive yearly increase since a decline following the 1984 high of 1100 cases. The epizootic (animal epidemic) began in September of 1981. Several thousand persons have received postexposure prophylaxis and there have been no human deaths.

The rabies epidemic has involved all of Maryland west of the Chesapeake Bay and is now progressing down the Eastern Shore (Delmarva Peninsula). Two counties, Caroline (10) and Queen Anne's (41), experienced the first year of terrestrial rabies. Kent County (57) recorded its first 2 cases late in 1989. Five counties have totals which are an increase over the previous year. Calvert (18) had a 125% increase, Charles, 8 (14%), Garrett, 45 (543%), Harford, 41 (51%) and Prince George's, 41 for a 28% increase. St. Mary's County (4) recorded no change. The remaining jurisdictions had fewer cases in 1990. The decrease ranged from 19% (Anne Arundel County) to 66% (Baltimore City). The number of cases decreased by 5 (Carroll County) to 24 cases (Baltimore County). Terrestrial rabies has not yet involved Talbot, Dorchester, Somerset, Wicomico or Worcester counties.

The number of confirmed rabid animals does not represent the incidence of rabies in the animal population since it is only the number of positive animals found out of the total number tested. It is likely that many more (3 to 9 times more) animals die of rabies without being detected. Further, the total animal population is not known.

Tested animals are almost always restricted to animals which have been submitted because of 1) human exposure, 2) domestic animal exposure, 3) needed differential veterinary diagnosis, and, less commonly, 4) selected other Public Health requirements.

The periodic fluctuation in confirmed cases within a jurisdiction may be the result of a cyclic effect resulting from a rebound in the raccoon population following the initial invasion of rabies. A

secondary and smaller increase in number is projected to occur at 3 to 5 year intervals. Because the spread of rabies is not limited by political boundaries nor by the calendar year, the initial and secondary peaks may be spread over more than one reporting period. The primary and secondary peaks are most easily recognized in jurisdictions with larger human populations which, in turn, results in greater rabid animal detection due to human contacts and because the raccoon population is several (up to 20 or more) times greater in suburban and urban areas than in rural areas.

The raccoon as the sole maintenance reservoir accounts for four fifths of all animal rabies (382/468) and is responsible for spreading rabies at about 25 miles per year. All rabies cases appear to be the result of exposure to raccoons since there is no evidence that rabies is being transmitted within other species.

In 1990 other wild carnivores accounted for 53 or 11% of total cases (17 fox, 35 skunk, 1 otter). Domestic animals accounted for 15 or 3% of the cases (1 dog, 1 equine, 2 bovine, 11 cats). There have been 94 cats confirmed rabid since 1981 as compared to 9 dogs. An early evaluation of human rabies exposure showed that 1/2 of the rabid cats exposed no one but that the remaining half exposed an average of 9.1 persons. Unique to the raccoon rabies epidemic is that 3 groundhogs (a rodent) were found to be rabid for a total of 49 since 1981. Wild rodents rarely are found to be rabid but because raccoons and groundhogs share burrows, the risk of exposure is great.

The epidemiological cycle of bat rabies is distinct from that of terrestrial (tetrapod) rabies and only rarely do terrestrial animals contract rabies from bats. Bat strains of rabies virus can be differentiated from terrestrial rabies strains by laboratories using monoclonal antibody tests. In contrast to an average of 26.9 confirmed cases of bat rabies over the past decade, 14 bats were found to be rabid in 1990.

## MANAGEMENT OF TICK BITES AND TREATMENT OF ROCKY MOUNTAIN SPOTTED FEVER AND LYME DISEASE

*This information is an update and expansion of information originally published in the Maryland Communicable Disease Bulletin, 1980, submitted by Charles L. Wisseman, Jr., M.D., University of Maryland School of Medicine.*

Prompt removal of attached ticks every 3 to 4 hours during a total body search will prevent the transmission of Rocky Mountain spotted fever (RMSF) and Lyme disease (LD). Although many methods have been described for removing ticks, a very satisfactory method is to grasp the tick firmly by its head with a pair of forceps and exert patient, steady, gentle traction until the tick mouth parts are pulled intact from the skin. Avoid contaminating the fingers with potentially infected tick products.

Have the patient take and record oral temperature twice a day, at 8 AM and 8 PM for two weeks,

with firm instructions to notify the physician immediately at the first sign of a temperature above the baseline.

RMSF should be considered if an unexplained fever occurs within 3 to 14 days of tick exposure. An acute serum specimen is drawn and specific antibiotic therapy is begun immediately with appropriate consideration of the routine precautions (drug allergy, pregnancy, staining of children's teeth, renal and hepatic functions, bone marrow function, physiological immaturity of the newborn, etc.). Oral tetracycline hydrochloride (25 to 50 mg/kg/day given in four divided doses), doxycycline (100 mg every 12 hours), or chloramphenicol (50-75 mg/kg/day given in four divided doses) are the drugs of choice. The selected antibiotic is usually administered for 7 days, continuing until 2 days after the patient has become

afebrile. The occasional patient may experience a febrile relapse after the drug is discontinued. Retreatment with the same drug is adequate. Antibiotic resistance has not been encountered. Convalescent blood specimens for serological confirmation of diagnosis are drawn at 2 and 4 weeks after onset.

Lyme disease should be considered during 3 to 32 days following tick exposure if a patient presents with erythema migrans or EM (an expanding, annular rash, 5 cm or greater), a flu-like illness or less commonly oligoarthritis, neurologic and cardiac manifestations. An acute serum specimen should be drawn and specific treatment begun. For adults, the EM stage can usually be treated effectively with doxycycline (100 mg twice daily), tetracycline HCl (250-500 mg four times daily), or amoxicillin (250-500 mg three times daily) for 10 to 21 days. Children less than 8 years old can be treated with

amoxicillin (20-40 mg/kg/day in divided doses). Erythromycin can be used in adults and children who are allergic to penicillin or who cannot take tetracyclines. Later manifestations of the disease require longer courses of therapy and/or intravenous therapy (see Medical Letter 1989;31:57-59). Ceftriaxone may prove to be a more effective antibiotic, especially for treatment of neurologic involvement at any age. A second blood specimen drawn in 3 to 6 weeks may provide laboratory confirmation of the diagnosis. However, Lyme disease serologic tests are not sufficiently sensitive nor specific to assure laboratory confirmation of the diagnosis.

The acute and convalescent serum specimens should be sent to the State Health Department Laboratory where specific serologic tests are routinely performed for the diagnosis of RMSF and for Lyme disease.

## MAJOR TICKBORNE DISEASES

In 1990 there were 21 cases of Rocky Mountain spotted fever (RMSF) and 185 cases of Lyme disease reported in Maryland (preliminary numbers). The earliest cases of RMSF appear in April. The number of cases peaks in July-August and decreases throughout the late summer. Lyme disease cases begin to increase in April, peak in June-July and slowly decrease in the fall months, although the onset of a few cases occurs throughout the winter. Tick paralysis and tularemia resulting from a tick bite have been reported in Maryland in the past. Both human ehrlichiosis and American babesiosis are reported in nearby states and, while rare, may be occurring in Maryland. Colorado tick fever and tickborne relapsing fever occur only in the western United States.

*The following disease descriptions are published with permission and are excerpted from Chapter 4, Ticks and Tickborne Diseases Affecting Military Personnel, USAFSAM-SR-89-2, September 1989 by Jerome Goddard, Ph.D. Dr. Goddard is currently the Medical Entomologist with the Mississippi State Department of Health. (References available upon request.) Lyme Disease will be covered in a later bulletin.*

### Rocky Mountain Spotted Fever

#### General

Rocky Mountain spotted fever is one of the most severe of all infectious diseases and is characterized by headache, chills, fever and a rash which characteristically begins on the extremities, especially the soles and palms. In some cases of RMSF there may be convulsions, coma, and death. Although treatable with broad spectrum antibiotics, about 5% of cases reported in the U.S. are fatal.

#### Natural History

The causative agent of RMSF, *Rickettsia rickettsii*, is transmitted to man by several species of ticks. In the U.S., 2 of the most important vectors are the Rocky Mountain wood tick *Dermacentor andersoni*,

in the West, and the American dog tick, *D. variabilis*, in the East. When infected ticks feed, rickettsiae are transmitted to the host via salivary secretions. Transmission may also occur when persons manually detick pets since tick body fluids are infective.

In nature, the disease agent occurs in cycles among small mammals with ticks acting as transmitters; man is infected as an accidental or dead-end host only. Ticks themselves may also serve as reservoirs of the disease because *R. rickettsii* is transovarially (parent to progeny via egg) transmitted from generation to generation in ticks. However, not all ticks are infected with RMSF organisms; within a vector species (e.g., *D. variabilis*) usually only about 1-5% are infected.

#### Epidemiology

In the U.S., RMSF accounts for the majority of all reported cases of rickettsial diseases. Approximately 700 to 1,000 cases of RMSF are reported in the U.S. annually, but the disease also occurs in Canada, Mexico and Central and South America (although sometimes under different names). RMSF occurs throughout most of the U.S. with its highest incidence in North Carolina and Oklahoma. Actually the name "Rocky Mountain" spotted fever is a misnomer since more cases occur in the eastern U.S. than in the Rocky Mountain area. Although RMSF occurs year-round, most cases occur from April through September when environmental conditions are optimal for tick activity.

#### Current status

Since 1984, the U.S. annual number of reported cases of RMSF has been declining. There were 1,126 cases reported in 1983; and 848, 700 and 746 cases in 1984, 1985 and 1986 respectively. The 1987 figure was even lower at 586. How much of this decline is real and/or a lack of reporting is not clear. Factors contributing to this decline may be the use of broad spectrum antibiotics to treat a number of diseases, and education of the public to avoid tick bites and to remove ticks promptly. With the recent

emphasis on Lyme disease, interest in serological confirmation and reporting of RMSF may also have waned.

## Human Ehrlichiosis

### General

Canine ehrlichiosis is a rickettsial disease of dogs that consists of a mild or severe febrile (acute) phase which may be followed by a chronic, highly fatal phase 2 to 4 months later. Whether or not human cases of "canine ehrlichiosis" are indeed caused by *Ehrlichia canis* is unknown at this time, but cases of suspected *E. canis* infection have been characterized by many spotted fever-type manifestations such as fever, anorexia, myalgia, arthralgia, headache, and nausea, and often referred to as "spotless" spotted fever. In addition, most patients have leukopenia, thrombocytopenia, and mildly high hepatic enzyme activities.

### Natural history

The disease in dogs is caused by *Ehrlichia canis*, an obligate intracellular rickettsia that parasitizes leukocytes of wild and domestic Canidae, and the brown dog tick, *Rhipicephalus sanguineus*, is the primary vector and reservoir. Other possible reservoirs include rodents, wild canids, and chronically infected dogs. Of all tick species, the brown dog tick probably has the most widespread distribution in the world today and is commonly found infesting homes of dog owners. The ticks may transmit *E. canis* to dogs for up to 5 months after engorgement. Transstadial transmission of the agent occurs in *R. sanguineus* but transovarial transmission apparently does not.

### Epidemiology

Little is known at this time about the epidemiology of human (canine) ehrlichiosis, but the disease in dogs occurs throughout many regions of the world and is widespread in the southern half of the U.S. Recently, human cases of the malady have been increasingly diagnosed. In 1986, the first confirmed human case of canine ehrlichiosis was reported from Arkansas, with at least six additional cases subsequently being confirmed in Texas in 1986. In Oklahoma in 1987, health department personnel reviewed numerous sera samples of suspected spotted fever cases that had tested negative for RMSF and found 16 sera significantly positive for *E. canis*. These reports suggest that many suspect cases of RMSF or murine typhus may actually be ehrlichiosis. Persons at greatest risk of contracting ehrlichiosis are those who regularly come into contact with tick-infested dogs.

### Current status

If *E. canis*, or a closely related agent, is becoming adapted to the human host, the incidence of human ehrlichiosis is likely to increase in many parts of the world. Various tick species may be involved in human cases of ehrlichiosis. Although *R. sanguineus* is the vector of *E. canis* to dogs, it is usually discounted as a vector to humans because it has historically only rarely bitten humans in the U.S. Recently, evidence was found indicating that this species may be becoming anthropophilic and increased human biting by this species is likely. This biting may also lead to an increase in the incidence of human ehrlichiosis.

## American Babesiosis

### General

Human babesiosis is a malaria-like disease of varying severity, which becomes clinically apparent 1-4 weeks after exposure. The disease is characterized by fatigue, anorexia, fever, chills, headache, and generalized myalgia.

### Natural history

The infecting organism of American human babesiosis is the rodent piroplasm (protozoan), *Babesia microti*, associated with the white-footed mouse. The vector to humans is exclusively *Ixodes dammini* that appears to be abundant only where numerous deer are found. According to Hoogstraal the *I. dammini-B. microti* associated disease is an ecologically unique, localized phenomenon: a benign zoonotic infection of rodents and ticks flaring into an outbreak infecting humans where environmental changes provide numerous hosts and shelters for dense populations of ticks.

### Epidemiology

American human babesiosis occurs primarily in the Massachusetts and New York area of the U.S., but particularly on Nantucket Island. The present limited focus of American babesiosis may be related to deer abundance and increasing contact of humans outdoors with vegetation harboring rodents and ticks. Annual case numbers are difficult to ascertain but over 100 cases of human babesiosis have been reported in the U.S. since 1969. Age of the patient affects the clinical course of disease with the most seriously ill patients usually being more than 60 years old. Few clinical cases have been diagnosed in spleen-intact persons below age 50.

### Current status

The incidence of human *Babesia microti* infections appears to be stable.

## Pneumococcal Vaccine:

**Remember to give pneumococcal vaccine to persons 65 years old and over and to those at increased risk of pneumococcal disease !**

## Which Box Would You Rather Deposit Your Insurance Reimbursements In?

If you process your claims through the mail, it takes an average of two months before your reimbursements make it to the bank.

And that can really put you in a box in terms of cash flow.

But not if you join the more than 1800 physicians who are now using HCS electronic claims systems. On the average, they receive payments in days, instead of months. Reason enough to consider using our custom designed systems.

What's more, our systems are labor savers. Stacks of claims that used to take weeks to process by mail can be sent through our claims

network in a matter of hours. Saving you enormously in administrative time. Not to mention postage.

And since HCS has the backing of a billion dollar health care organization, you can depend on us for long term support, service, and solutions as your office needs change.

Call Toll-Free 1-800-543-6711 for more information. Because in rain, snow, sleet or hail, we can deliver insurance reimbursements faster.

Are you desperately in need  
of a **DEPENDABLE**  
office management system?

## Turn to The Medical Manager® — more than 10,000 in use, nationwide.

Many medical practices have had the unfortunate experience of going with an office computer system that had no "follow up." When you took two aspirin and called them in the morning, they weren't there.

That's why more and more doctors are switching to the No. 1 selling software for medical practice management in the country—The Medical Manager.® As the nation's second largest dealer, we have more Medical Management systems in operation in the mid-Atlantic states than any other dealer.

It's possible that our new system, customized for your particular practice, will cost *less* than updates you need for your old system. In some cases you can

use the hardware you have, since The Medical Manager® runs on most micro computers.

After we install The Medical Manager® system, we train your staff, and continue to provide on-going support *every time* you call!

Please tell us about your system and your needs. We'll give you a **FREE ESTIMATE** on converting your system. Yes, we make office calls!

## Committee Selection Cards

---

---

## 1991 Annual Meeting

---

Med Chi members interested in serving on a Med Chi Committee during 1991-1992 should complete the committee selection card following this newsletter. All members should complete this card by March 31, 1991 in order to be considered for appointment to a Med Chi committee.

A registration form for Med Chi's 1991 Annual Meeting, "American Medicine Today, Perspectives from Maryland," is featured on pages 222 and 223 of this MMJ. The meeting will be held on Wednesday, May 8 thru Saturday, May 11, 1991 at the University of Maryland Center of Adult Education in College Park, Maryland. AMA President John C. Tupper MD will address the House of Delegates on May 8th. Mrs. Marilyn Quayle and Senator John D. Rockefeller, IV (D-WV) will also speak during the meeting.

Entertainment for this year's meeting includes a performance by the Capitol Steps, a political cabaret troupe from Washington, on Wednesday May 8th. There will also be a dinner honoring Med Chi President Reynaldo L. Lee-Llacer MD on Friday, May 10th. Call now to make your reservations for these events.

To pre-register for the Annual Meeting by phone or for additional information, call Michael Moran at 301-539-0872 or 1-800-492-1056.

---

## Physicians in the Persian Gulf

---

Med Chi would like to recognize the dedicated physicians serving in America's armed forces who have been called to action in "Operation Desert Storm" in Saudi Arabia. If you know of a colleague who has been called to serve, please contact Med Chi's Public Relations Department at 301-539-0872 or 1-800-492-1056.

---

## Physician Volunteers for War Effort

---

Med Chi has received many inquiries from physicians who wish to volunteer for civilian duties in a military facility or a V.A. hospital and from physicians interested in active military service. For more information contact one of the numbers listed below:

### Civilian Volunteers

American Red Cross 202-639-3589

## Florida Liability Insurer Ceases Operations

---

Following a Florida state insurance department hearing, the Physicians National Risk Retention Group (PN), a subsidiary of Physicians National Reliance Group, has agreed to stop doing business in that state. After an examination of PN's financial statements, the Florida insurance examiner was concerned that PN's reserves might not be enough to pay claims. The State insurance department concluded that PN was in a "hazardous financial condition" and "created a serious danger to the safety and public

---

## *Medical Mutual Seminar Offers 5% Premium Discount*

---

welfare of the citizens in the State of Florida, including the policy holders, subscribers, claimants and creditors who are dependent upon Physicians National." PN has been offering coverage at rates 20 percent less than those charged by other programs. Some Florida doctors reported paying 50 percent less.

Medical Mutual has announced it will offer its subscribers a 5 percent discount on their 1992 Medical Mutual renewal premium for attending a seminar, "Medical Records: Charting A Course for the 90's," during 1991. The seminar is designed to provide physicians with a basis for quality assurance within the medical practice. The course covers both basic and legal principles of record-keeping and offers practical applications for risk management. Med Chi is co-sponsoring the seminar which is designated for 3 credit hours in Category 1 of the Physician's Recognition Award of the AMA. The seminar will be given through September and sessions will be held at Medical Mutual, Med Chi and a number of different locations around the State. Each seminar runs from 5:00-9:00 p.m. Registration and a light supper begin at 5:00 and the seminar starts at 5:30 p.m. The fee for the seminar is \$40.00 per person.

Since the last seminar will be held on September 30, 1991, physicians are urged to attend an early session to avoid a "crunch" at the end. For more information about the seminar, please call Natalie Harper or Roz Laakso at Medical Mutual at 301-785-0050 or 1-800-492-0193.

## *Billing for HMO Members*

---

In a recent letter to a Maryland physician, the Consumer Protection Division of the Office of the Attorney General provided a clarification regarding when a physician may bill a patient for services not covered by an HMO. Current law prohibits providers from billing HMO members for services covered by the HMO (H.G. 19-710 (o)). However, the Health Ombudsman of the Office of the Attorney General states that as soon as the provider has confirmed that the service is not covered, either because the consumer went outside the plan or for any other reason, the provider may bill the patient as a self-pay patient. For further questions regarding this issue, contact the Consumer Protection Division at 301-576-7216.

---

## *Health Access America*

---

The AMA is mounting a comprehensive campaign to reform the health care system, called Health Access America. Physicians need to be at the forefront of health care system reform, working at the state and local levels through the Federation of medical societies. To accomplish the ambitious goals of the Health Access America proposal, the AMA and Med Chi members are focusing on communication and legislation activities. Herman C. Maganzini MD, Chairman of Med Chi's Public Health Committee, is coordinating Health Access America efforts in Maryland.

For more information on how physicians can help spread the word about Health Access America, contact Betsy Newman at Med Chi at 1-800-492-1056 or 301-539-0872.

---

## *International Medical Graduates*

---

At its October meeting, the AMA Board of Trustees voted to support federal legislation designed to assist International Medical Graduates (IMGs) in obtaining initial state licensure, licensure by endorsement, medical staff positions, and clinical privileges. The bill seeks to provide measures to help to overcome what IMGs view as discriminatory practices. The bill would create a voluntary national repository of IMG records to be established by the Secretary of the Department of Health and Human Services.

---

## *March 30th is Doctor's Day*

---

President George Bush has proclaimed March 30th as "National Doctor's Day" in recognition of the invaluable contribution physicians have made to the Nation and continue to make in our daily lives. This proclamation enables citizens of the United States to publicly show appreciation for the role of physicians "in caring for the sick, advancing medical knowledge, and promoting good health."

---

## *Governor's Committee on Employment of People with Disabilities Awards*

---

Med Chi is interested in nominating a physician for the Health Care Professional of the Year Award offered by the Awards Subcommittee of the Governor's Committee on Employment of People with Disabilities. This award is presented to a health care professional who has made an outstanding contribution in advancing employment opportunities and/or who has played an important role in the rehabilitation of disabled individuals. If you would like to nominate a physician for this award, contact Med Chi's Public Relations Department at 301-539-0872 or 1-800-492-1056.

---

## *Photo Contest*

---

All Med Chi physicians and auxiliary members are invited to express their photographic talents in the 1991 Med Chi Photo Contest. First and second prizes will be awarded for black and white and color photographs and all entries will be displayed during the 1991 Annual Meeting at the University of Maryland Center for Adult Education in College Park. For more details on the contest, see the ad on page 218.

---

## *Doctor/Lawyer/ Teacher Partnership Against Drugs Update*

---

The Doctor/Lawyer/Teacher Partnership Against Drugs was honored with the American Bar Association's top Partnership Award in January. Med Chi is currently seeking physician volunteers for this program throughout the State.

In Baltimore City, 24 out of 27 schools are participating in the program. Statewide coordinator, Hiroshi Nakazawa MD, reports that doctor/lawyer teams are scheduled to speak to students throughout February, March and April. Several other counties around the State are also initiating doctor/lawyer partnerships. In Prince George's County, Kevin Hennesy MD and Valerie Siegal, Esq. spoke to a group of approximately 10 physicians and 25 attorneys during a training session in January. In Harford County, doctor/lawyer teams plan to visit more than 100 physical science classes in county middle schools between February and June. Amelito Canlas MD, a Past-President of the Harford County Medical Society, is actively recruiting physicians for the program. So far more than 10 local doctors and 60 lawyers have volunteered to participate. Laurie Dawson, a county teacher, is coordinating the program in Harford County.

In Western Maryland, Gerald Schipper MD recently reported that doctor/lawyer teams have already completed 2 school visits out of the 9 middle schools in Frederick County. He added that there are 10 physicians in Frederick county who have volunteered for the program. Med Chi coordinators on the Eastern shore include Donald Lewers MD in Talbot County and John Seymour MD in Kent County.

In Baltimore County, Gary Pushkin MD and Baltimore County Medical Society Executive Director Nielsen Andrews recently met with John S. Heck EdD, Coordinator for the Baltimore County Schools Office of Health, and began plans to initiate a pilot program in high schools in the Dundalk, Pikesville and Dulaney Valley areas. Dr. Pushkin and Debbie Sweet are the county coordinators for this effort.

To volunteer for the Doctor/Lawyer/Teacher Partnership Against Drugs, contact your local component society or Med Chi's Public Relations Department at 301-539-0872 or 1-800-492-1056.

---

## *"You're Good. Too Good for Drugs." Magnets and Posters*

---

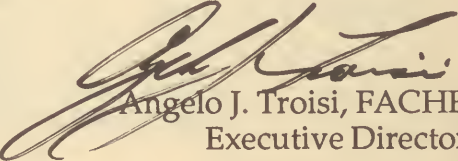

"You're Good. Too Good for Drugs." is the slogan of Med Chi's Doctor/Lawyer/Teacher Partnership Against Drugs. To promote this slogan, the Physician Rehabilitation Program has sponsored the production of "picture frame" magnets and posters to be distributed by doctor/lawyer education teams during their visits to schools. All Med Chi physicians can request these items for students and their patients. Both the magnet and poster are aimed at reminding people, especially the young, they don't need to start taking drugs and that support systems are available to help them avoid making the wrong decisions. To order your magnets and posters contact Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

---

## *Medicare Funds Released*

---

The Office of Management and Budget has agreed to release approximately \$75 million of the Medicare contractors contingency fund. Health and Human Services sources indicate that \$75 million should be sufficient to avoid the two-month delay in physician payments that were predicted if additional funds were not forthcoming.

  
Angelo J. Troisi, FACHE  
Executive Director

...essarily meet your needs as a Maryland physician, Med Chi must maintain an extensive framework of committees to uphold prior commitments, manage current programs, and formulate new policy. It is essential that these committees be comprised of interested members so that Med Chi will remain a strong, viable, and active organization.

Please indicate your willingness to serve by checking your committee preference and special interests on the reply card. Every effort will be made to appoint you to the committee of your choice.

We intend to appoint as many members as possible to committees to insure Med Chi's continued growth as the leading voice for medicine in Maryland.

Thank you for your support.  
J. David Nagel MD  
President-elect

I am interested in serving on the following Med Chi committees:

- |  |   |
|--|---|

# Central Laboratories

Established 1970

## Central Laboratories Would Like to Thank the Medical Community in Maryland for 20 Years of Service

### **MISSION:**

Central Laboratories is a leader in clinical laboratory reference testing. We have served the medical community for more than twenty years. Our mission is to continually improve our services to meet the needs of our clients and patients.

### **GUIDING PRINCIPLE:**

Central Laboratories strives for excellence in everything we do; in our services, our human relations, and our competitiveness.

Central Laboratories is pleased to announce that the same high quality services with uncompromised integrity that we provide to the hospitals in Maryland is now available to physicians offices, industry, and long-term healthcare facilities. Please phone the marketing department for information on our services. We will be pleased to provide a customized proposal for your laboratory testing needs.

# Medicine at Maryland: 1807-1991

---

John A. Kastor MD

---

*Dr. Kastor is Theodore E. Woodward Professor of Medicine and Chairman of the Department of Medicine at the University of Maryland School of Medicine, and Physician-in-Chief of the University of Maryland Hospital, Baltimore. Reprints: John A. Kastor MD, University of Maryland Hospital, 22 South Greene St., Baltimore, MD 21201.*

One hundred and eighty-four years ago, teaching in what we now call Internal Medicine was first offered to medical students at the University of Maryland School of Medicine in Baltimore by a "department" consisting of one physician, Dr. Nathaniel Potter, Professor of the Theory and Practice of Medicine. In 1991, the Department of Medicine carries out its work with a faculty of 138 full-time and 223 part-time and volunteer members, 139 trainees, and an administrative, clerical, and technical staff of 347.<sup>1</sup> Clinical medicine in Dr. Potter's day was taught mostly by lectures in the amphitheater of Davidge Hall. Now, the Department of Medicine educates its students and postgraduate trainees in its research laboratories, and at the bedside and in the outpatient clinics of its primary teaching hospitals (the University of Maryland Hospital and the Baltimore Veterans Administration Medical Center), and at Mercy Medical Center, as well as Union, York and other affiliated hospitals.

As the only state medical school in Maryland, the School of Medicine has continuously fulfilled its responsibility to train physicians who will practice the profession within our State. Accordingly, over 25 percent of Maryland physicians and surgeons have received their MD degrees from the University of Maryland School of Medicine. The School and Department are also charged to give sophisticated, contemporary medical care in their teaching hospitals and to conduct research that will benefit the citizens of the State and the nation.

In this issue of the *Maryland Medical Journal*, the Department of Medicine reports on the educational, clinical, and research activities being conducted by its faculty and staff. The first article describes the work of the chairmen who preceded Dr. Theodore E. Woodward (our renowned and much respected leader for twenty-seven years) and who built the Department from its earliest days; recounts the racial integration of the medical wards in the 1960s, a subject which may seem foreign to our current students and younger graduates; and discusses the Department's educational programs, as well as the operation of our medical service at the Baltimore Department of Veterans Administration Medical Center. This historical perspective and overview of the Department sets the stage for the subsequent articles, in which members of the general medical and specialty divisions discuss the work they and their colleagues are conducting, and describe the advances being made in the management of some of the diseases internists treat.

I hope that the readers of the *Maryland Medical Journal*, both those who are and who are not graduates of the University of Maryland School of Medicine and its training programs, will enjoy this "dedicated" issue. The Department thanks the Editor and the Editorial Board for giving its faculty this opportunity to contribute to the *MMJ*.

Philip A. Mackowiak MD, and Frank M. Calia MD

---

---

*In the past 184 years, the University of Maryland School of Medicine has undergone enormous changes, making significant contributions to medical education and the health and welfare of the State.*

---

*From the University of Maryland School of Medicine, where Dr. Woodward is Professor of Medicine Emeritus; Dr. Saunders is Associate Professor of Medicine, Head of the Hypertension Division and Clinical Director of the Hypertension Center; Dr. Kushner is Associate Professor of Medicine and Senior Medical Consultant in the Division of General Internal Medicine and Geriatrics; Dr. Mackowiak is Professor of Medicine and Associate Chairman of the Dept. of Medicine, as well as Director of the Medical Service at the Baltimore DVAMC; and Dr. Calia is Professor of Medicine, and Vice Chairman and Director of Education in the Dept. of Medicine. Reprints: T.A. Woodward MD, Dept. of Medicine, University of Maryland Hospital, 22 S. Greene St., Baltimore, MD 21201.*

From the beginnings of the University of Maryland School of Medicine in 1807, the principles of medicine were presented to students by a small, dedicated cadre of faculty. Lecturing in Davidge Hall, professors taught clinical medicine as it was then known. With the development of the Baltimore Infirmary in 1823 (forerunner of University Hospital), students learned from professors during rounds. Students and graduates served as house officers, probably the first example of residency training in the country. In these early days, graduation requirements consisted of passing an oral examination and preparing a thesis.

## The Chairmen 1807-1922

The first active chairman was Dr. Nathaniel Potter (Figure 1), a student of Benjamin Rush. His lectures embraced the manifestations and natural course of diseases, as well as the means of therapy. Potter insisted yellow fever was not contagious from person to person (the mosquito transmission mechanism was not described until 1900). He died in 1844.

Dr. Elisha Bartlett (Figure 2) succeeded Potter; his tenure was short, 1844 to 1846. Bartlett, one of the nation's leading medical scholars, completed his classic text on febrile illnesses while at Maryland.

William Power (Figure 3) succeeded Bartlett and chaired the Department from 1846 to 1852 when he resigned because of poor health; he died of pulmonary tuberculosis. Power, from a prominent Baltimore family, introduced the stethoscope to Baltimore. He initiated a preceptor educational program for students in bedside skills, including demonstration of the technique of percussion and the use of the stethoscope.

Samuel Chew (Figure 4) succeeded Power. Chew was a classic

Chairman 1844-1846.

**Figure 3.** William Power MD,  
Chairman 1846-1852.

scholar who emphasized the importance of complete examination, the interpretation of the history, and the rational use of medications. After Samuel Chew's death, Richard McSherry (Figure 5) directed the Department from 1863 to 1886. He was a scholarly, cultured physician who commanded much respect in the community.

Through the years up to the Civil War, students were grounded in the basic principles of general medicine which emphasized diagnosis, therapeutics, and ethical care. Because of their practice responsibilities, faculty had little chance to engage in research. Professor Charles Frick, a pioneer in experimental pharmacology from 1858 to 1886, was an exception. Frick made the initial report of chemical changes in blood produced by disease.

After the Civil War, the curriculum was strengthened and the period of instruction was lengthened. Medical school graduates were assured of having a solid background, enabling them to render high quality care. Students often fortified their positions by serving as apprentices with established physicians.

During this period, Francis T. Miles, Clinical Professor of Physiology, was the first to teach the subject of nervous diseases in Baltimore. One of his students, Henry M. Thomas, pioneered the discipline of neurology at Hopkins.

Some eminent graduates during the late nineteenth century include: Francis Donaldson (histologic diagnosis of cancer); Henry Rose Carter (epidemiology, yellow fever); William T. Councilman (pathology, yellow fever, protozoal diseases); James Carroll (yellow fever); James H. Wright (pathology, Wright's stain); Francis G. Kierle (rabies); Henry M. Thomas (medicine, neurology); and Samuel T. Darling (histoplasmosis, parasitology).

From 1886 until 1909, the Department was directed by Samuel Claggett Chew (Figure 6). His writings

demonstrate his interests and capabilities in the application of bedside clinical skills. Chew was chairman just before publication of the *Flexner Report*, which recommended faculty devote more time to educational pursuits and the development of new knowledge. Thus, beginning in 1911-1912, basic science departments but not clinical departments, were provided small salaries for positions at Maryland.

From 1913 to 1922, Dr. Gordon Wilson (Figure 7) chaired the Department on a part-time, nonsalaried basis. Schooled as a clinician after graduating from the University of Virginia Medical School, Dr. Wilson was particularly adept in diseases of the lungs.

#### **Dr. Maurice C. Pincoffs, Chairman 1922-1954**

Dr. Maurice C. Pincoffs (Figure 8) was appointed chairman in 1922 and held this position until 1954 when he resigned to begin a Department of Preventive and Rehabilitative Medicine. Dr. Pincoffs, a remarkable teacher and persuasive lecturer, also understood the roles of epidemiology, preventive control measures, and emotional disturbances which were necessary to prepare the well-rounded physician. His standards were instrumental in inculcating the highest ethical principles; these precepts were imprinted upon those who studied under him.

After World War II, it was apparent that departments of medicine must direct attention to research. Schools failing to engage in research would be relegated to mediocrity. The Department entered into research, recruiting physicians with either a background in investigative medicine or those who, through career development, would become investigators.

Until 1948 there were no full-time teachers in any clinical discipline at the University of Maryland Hospital. At that time, Dr. Pincoffs was paid a part-

Chairman 1954-1981.

time salary as chairman. The President of the University and the Board of Regents believed certain key positions in the medical school and hospital should be filled by full-time faculty. In September 1948, Dr. Theodore E. Woodward (Figure 9) joined the Department as the first full-time member. The teaching of students and a small house staff, as well as patient care, were rendered by dedicated part-time, nonsalaried physicians in Baltimore. The structured divisions within the department were: Cardiology (Dr. William S. Love), Physical Diagnosis (Dr. Conrad Wolff), Dermatology (Dr. Harry M. Robinson, Sr.), and Clinical Pathology (Dr. John Huck). The Department's budget in 1948 was approximately \$40,000.

Beginning in 1948, new divisions were organized and

developed with active research and teaching programs being initiated in infectious diseases. The lab facilities for this work were virtually non-existent, nor was there support for investigative studies, equipment, or personnel; these were recruited from outside sources. A Division of Infectious Diseases was established on the fifth floor of the Bressler Building; Dr. Woodward was the first Director. A grant of \$10,000 from McCormick and Company, Inc. made it possible to study the efficacy of antibiotics, particularly chloramphenicol, in Baltimore and Puerto Rico. Soon diseases such as typhoid fever, Rocky Mountain spotted fever, bacterial meningitis, brucellosis, tularemia, plague, and various forms of bacteremia were investigated. The first cure for many of these diseases was a product

of this research. These beginnings were followed by grants from pharmaceutical laboratories, the Department of Defense, and the National Institutes of Health (NIH). The Fellowship Training Program was developed in The Division of Infectious Diseases and, in 1952, a unique study of infections in volunteers was initiated. Drs. Robert T. Parker, Fred R. McCrumb, Jr., and Richard B. Hornick directed the program.

Other divisions of the Department of Medicine were soon developed including Cardiology (Dr. Leonard Scherlis), Clinical Pathology (Dr. Milton Sacks), Dermatology (Dr. Harry M. Robinson, Jr.), Neurology (Dr. Charles Van Buskirk), Endocrinology-Metabolism (Drs. Thomas B. Connor and John G. Wiswell), Rheumatology (Dr. Henry J.L. Marriott, followed by Dr. Adalbert Schubart), Pulmonary Diseases (Dr. William Spicer, later Drs. Glenn Lubash and John Sadler), Nephrology (Drs. Samuel T. R. Revell and Francis Borges), Gastroenterology (Dr. W. Carl Ebeling, followed by Drs. Howard F. Raskin and Frank Iber), Nuclear Medicine - Radioactive Isotopes (Drs. Joseph B. Workman and Robert Bauer, followed by Drs. John Wiswell and Gerald S. Johnston).

A large cadre of part-time faculty members remained active. The Ambulatory Services Clinic, on the top floor of the old hospital, was directed during World War II by Dr. Kurt Levy, then placed under the directorship of Dr. Revell and later, Dr. Frank Borges. Dr. Herbert Kushner succeeded Dr. Borges. Dr. William Spicer developed a program in primary care. A strong aspect of the educational program emphasized emotional and psychosomatic disturbances. Dr. Ephraim T. Lisansky was in the forefront of stressing the need for a comprehensive approach to patients' problems.

Beginning in 1950, the affiliation with Mercy Hospital was redeveloped and a full-time program was initiated with Dr. Vernon Smith as head. Dr. Jay S. Goodman succeeded Dr. Smith who had developed a teaching and practice unit in Gastroenterology aided by a grant from the Hartford Foundation. Training under Dr. Goodman led to the development of an effective academic affiliation. There were similar developments at Maryland General Hospital with Dr. Edward F. Cotter as head, later followed by Dr. James Karns. Because of inadequate numbers of patients at the University of Maryland Hospital, medical students received much of their training at Mercy, Maryland General, Baltimore City, and the Veterans Administration (VA) hospitals. Junior students later received training at the University of Maryland or VA Hospitals when the census increased. Senior students continued to receive much of their training at the affiliated hospitals and York Hospital in Pennsylvania.

The World War II years provided an opportunity for physicians to broaden their knowledge of clinical and research medicine because of soldiers' exposure to pestilential, emotional, and traumatic hazards. Drs. Pincoffs and Krause were among faculty members who had war experiences. Too much credit cannot be given to those few who worked incessantly at home during

this five-year period. Drs. Thomas Sprunt and T. Nelson Carey directed the activities of the Department. Dr. Carey was most effective and dedicated in his role as chairman and maintained high teaching standards.

#### **Dr. Theodore E. Woodward, Chairman 1954-1981**

From 1948 to 1954, there was a period of re-evaluation and reorganization when full-time teachers appeared threatening to the part-time group. Part-time teachers were included in the planning despite busy practices. Reorganizing the school's curriculum was necessary in order for clinical departments to keep abreast of contemporary teaching practices. The Department changed to small-group, preceptor-type teaching rather than didactic lectures.

With new faculty and improved facilities, the Department was able to fulfill its roles in teaching, research, and patient care. The house officer program was underway by 1955. The preceptor course in clinical medicine for sophomore students continued to be a strong example of effective teaching. The junior and senior clerkships were successful because of dedicated attending physicians, house officers, and fellows. Medical Grand Rounds were changed from informal case discussions to formal sessions presented in Gordon Wilson Hall. Visiting educators came every three to four weeks to conduct Grand Rounds and small teaching conferences. The Department began sponsoring the Maurice C. Pincoffs Lecture, which has been given since 1957. Research programs were productive and successful. During the years 1979 to 1980, the total research budget was approximately six million dollars and the legislative budget was approximately five million.

A residency program in General Practice (now known as Family Medicine) began in the Department in 1955. Candidates who completed this training were qualified in Internal Medicine and General Practice. In 1972, this program was made an autonomous Division of Family Medicine, which later became a Department of Family Medicine, now under the direction of Dr. C. Earl Hill.

There were two important departmental developments during the early 1960s. The University received a Public Health Service grant to establish a Center for International Research and Training. The award was made to the Departments of Medicine and Microbiology with Drs. McCrumb and Charles Wisseman as co-directors. The Center was to advance the studies of the health sciences in the U.S. and other countries, stimulating research and improvement of health. Labs in Lahore, West Pakistan were constructed and in operation by 1963. Dr. Merrill J. Snyder was helpful in directing their installation. The research included work on nutrition, enteric diseases, malaria, fevers of obscure origin, demography, genetic studies of mosquitoes, rickettsioses, encephalitis, and meningitis. The Center flourished for two decades.

Another development was the opening of a Clinical Study Center sponsored by the Division of En-

ocrinology-Metabolism under Dr. Thomas Connor; it was made possible by NIH which provided funds for a ten-bed unit. This special unit which functioned for over a decade, provided long-term evaluation of patients with nutritional, metabolic, hematologic, infectious, developmental, and other disorders.

### **Baltimore Department of Veterans Administration Medical Center**

In the late 1960s, the Department established a relationship with the Baltimore VA Medical Center (DVAMC) and this affiliation was strengthened in the decades to follow. The DVAMC medical service is now a vital part of all Departmental activities. The Baltimore DVAMC and its Medical Service have undergone a metamorphosis since their inception. On October 26, 1952, the 295-bed facility began operation with the specific mission of conducting an "all-out battle against tuberculosis." The cost of construction was \$4,850,000.

When the Baltimore DVAMC opened, tuberculosis (TB) was a major public health problem. The DVAMC (Figure 10) was to provide long-term treatment for this illness. Private and semiprivate rooms replaced multi-bed wards. Special programs allowed patients to earn high school diplomas, obtain prevocational training, and develop skills in ceramics and woodwork. A radio control booth piped programs to each bedside, as well as to six bedrooms for use by out-of-town relatives visiting patients.

The same year the Baltimore DVAMC began operation, isoniazid emerged as a treatment for TB and was shortly to relegate the sanatorium to obsolescence. With the rapid decline in cases of TB requiring prolonged hospitalization, the mission of the Baltimore DVAMC changed. In 1962, ninety-five beds were converted to general medical-surgical beds, and in 1967, the facility was redesignated a general hospital. The Medical Center strengthened its ties with the two Baltimore medical schools, and developed training programs in Medicine, Surgery, Radiology, Neurology, Pathology, and Anesthesiology.

Today, the Medical Service enjoys a close affiliation with the Department. Each member of the clinical staff has an academic appointment with the tripartite responsibility of patient care, teaching, and medical research. The Medical Service has sixty acute care beds, seven cardiac care unit (CCU) beds, and seven medical intensive care unit (MICU) beds. Approximately 3,500 patients are admitted each year. Subspecialty and general medicine clinics handle 34,000 patient visits annually. Although a meaningful interplay between the Baltimore DVAMC and the University of Maryland School of Medicine has existed since the Medical Center's inception, this integration is now complete. All elements of the educational pro-

gram of the Medical Service are incorporated into the curriculum.

The Medical Service's most gratifying progress in recent years has been in the area of research. In the past five years, the number of funded investigators has increased from twelve to thirty-one. Research dollars awarded have risen from \$588,124 to \$8,261,785 annually. Seventeen investigators are funded by federal agencies, including four with VA career development awards. The research conducted covers a broad range of interests.

The immediate future of the Baltimore DVAMC is linked to a replacement facility (Figure 11) that will become a reality in 1992. The new 324-bed facility will be located adjacent to the University Hospital. The structure, with a glass and red-flecked granite exterior and an atrium rising six floors, will house 700,000 square feet of space (twice the amount in the existing facility), and an underground garage with 700 parking spaces. To facilitate cooperative efforts, a bridge will connect the new DVAMC with University Hospital. The cost of building and equipping the facility is roughly \$100,000,000.

**Figure 10.** The Baltimore Veterans Administration Hospital which opened in October 1952.

**Figure 11.** The new Baltimore Department of Veterans Administration Medical Center is scheduled to open in the fall of 1992.

## Integration of the Medical Service

Until the early 1950s, no black medical students or house officers were members of the student body or the medical house staff training program at the University of Maryland School of Medicine and its hospital. Dr. Ernest O. Brown, who was probably the first black medical student, graduated in 1956 and trained in surgery. Dr. Louis L. Randall graduated the next year and took his house officer training in Obstetrics and Gynecology at the University of Maryland Hospital. Then in 1960, three black students, Drs. Elijah Saunders, Frank Washington, and Lois Young (later Dr. Lois Young-Thomas), graduated in Medicine from Maryland. Dr. Saunders, whose experience in integrating the medical services is described below, trained in Internal Medicine and Cardiology at the University of Maryland Hospital, and is now a senior faculty member in the Department. Dr. Young-Thomas became a distinguished ophthalmologist and was a valued faculty member at the University of Maryland and Johns Hopkins hospitals until her untimely death in 1986.

It is regrettably true that most southern medical schools, including those in Baltimore, practiced segregation of the races on the ward teaching services. The University of Maryland Hospital was no exception to this practice. During the 1950s and early 1960s, most patients who occupied the so-called "free" ward beds, came on referral from physicians who practiced in rural areas. Other sources of patients on the teaching services came from the emergency room or the outpatient clinics. This system, albeit selective, provided a balance of patient clientele with differing medical problems, affording the medical student a broad representation of medical syndromes. (Medical problems presented by rural patients often differed from those of patients who came from the city.)

In 1962, the Department Chairman, Dr. Theodore E. Woodward, met with prominent black physicians and civic leaders, as well as the director of the University of Maryland Hospital to discuss this problem. The reasons for the segregated services were explained. There was open and free discussion between all of those in attendance. It was agreed at this meeting that the ward services would be fully integrated with the aim being to maintain a balanced and effective teaching service and, accordingly, the male ward services were integrated. Black house officers and others serving in Medicine were very helpful in implementing this important change, particularly through admission practices. Meanwhile, various senior faculty members conducted regular teaching seminars at Morgan State University in order to encourage black students to attend medical school; this proved to be effective.

However, by 1964, the female medical wards were still segregated by race and sex. This situation was offensive to many, but especially to two house officers who were members of minorities: Dr. Elijah Saunders, who was the first black house officer and a cardiology fellow in the Department (1960-1965), and Dr. Herbert A. Kushner, who was a resident in Medicine in 1964. They shared a distaste for this medically unreasonable policy which was not actively promoted, but passively accepted. Movement toward complete integration seemed to have slowed down in spite of the fact that it was then ten years since the Supreme Court had struck down "separate but equal" practices in public education. They discussed ways to integrate the wards to remove any perception of unequal care.

One night when the only beds available were on the white female ward, a black woman presented to the emergency room in pulmonary edema. The medical indications were clear; they admitted the black patient to the white ward. For the next several days, all sorts of repercussions were expected. Interestingly enough, no explosions occurred, although there was much talk among the house staff, nursing staff, medical and nursing students, and patients.

Gradually, the pattern moved from an occasional "integrated admission" to complete and full integration of patients on the medical ward service. De facto desegregation had become de facto integration. Thus, the protocol for admitting patients according to illness and not according to race was established.

Further improvement of minority participation in Department of Medicine activities occurred in the early 1970s when Dr. George Finney, Sr. asked the Department of Medicine to assist Provident Hospital in developing a house officer training program. Toward this end, the chairman and senior faculty members conducted regular Grand Rounds and seminars at Provident Hospital. Medical graduates from Howard University and other medical schools were encouraged to choose Provident Hospital for their training with the understanding that much of their experience in Internal Medicine and subspecialties would be taken at the University of Maryland Hospital, particularly in Medicine. This was effectively implemented.

Dr. Charles Payne, an internist with specialty experience in pulmonary diseases, was recruited from Cleveland to serve as Chairman of Medicine at Provident Hospital, with a joint appointment in the Department of Medicine at the University of Maryland. Physicians who participate in teaching programs at Liberty Medical Center, the successor to Provident Hospital, continue to hold faculty appointments at Maryland. ■

The Baltimore DVAMC Medical Service looks forward to a productive future. While continuing to fulfill its original mandate of caring for veterans with TB, it will also minister to those with other medical

problems. Included in the new facility are a ten-bed chronic dialysis unit, a tertiary-care cancer program, and an invasive cardiac catheterization lab with cardiac surgery backup provided through University Hospital.

State-of-the-art endoscopy suites will augment the capabilities of both the Gastroenterology and Pulmonary sections. A fully-equipped, fifteen-bed Special Diagnostic and Treatment Unit will be used to support clinical research. Preliminary steps have also been taken to build a comprehensive geriatric program, including acute care, outpatient, home-care, and nursing home programs, as well as active research and education programs. Finding the resources (i.e., finances, personnel, and space) to meet our obligation to our aging veteran population could prove to be one of the greatest challenges on the way to the twenty-first century.

### Medical Education

From its inception in the early nineteenth century, the University of Maryland School of Medicine has had a commitment to training practicing physicians for the State and surrounding areas. This commitment has been met particularly by the Department of Medicine.

The Department has educational responsibilities at multiple levels. Many faculty participate in the basic science courses given during the first two years of medical school, and have secondary appointments in basic science departments. *Introduction to Clinical Practice*, which runs throughout the sophomore year, teaches history-taking, physical examination, and problem-solving. Groups of two students meet weekly with preceptors, with half of the groups taught at the University of Maryland Hospital and the Baltimore DVAMC by full-time faculty, and the remaining groups at affiliated institutions by volunteer faculty. The Department is indebted to its volunteer staff for this teaching commitment which enriches our program. A significant number of careers in Internal Medicine have begun because of the profound impression these faculty have made on our students.

Junior students complete a twelve-week clerkship in Internal Medicine, spending one month each at the University of Maryland Hospital, the Baltimore DVAMC, and the Mercy Medical Center. Assigned to wards in groups of two to three, they assume increasing responsibility under the supervision of the resident and attending physician. Each morning, faculty members meet with students to present various topics. Students participate in work rounds and attending rounds, and follow patients throughout their hospital course, refining their diagnostic, problem-solving, and therapeutic skills. At the University Hospital, students are also assigned a preceptor who meets with them twice weekly to review cases, allowing faculty to teach one-on-one.

Senior students must take a two-month sub-internship, and most take it in Internal Medicine. Students spend one of the two months at either the University of Maryland Hospital or the Baltimore DVAMC. The remaining month may be spent at one of these institutions or at an affiliated hospital. Seniors have four months of electives, and many opt for rotations in the Department's subspecialties. Although, nationally, there has been a downward trend in graduates entering

primary care specialties, especially Internal Medicine, this does not seem to have affected the University of Maryland. Whereas fewer than 20 percent of graduating seniors nationally enter Internal Medicine or its subspecialties, more than 30 percent of our graduates enter this field. Many who have gone into Internal Medicine at other academic institutions have become chief medical residents.

The Department has a major commitment to postgraduate training. Approximately twenty-two graduating seniors from around the country enter our residency program annually. An additional eleven graduates are selected for a one-year internship, preparatory for training in other specialties such as Neurology, Psychiatry, and Anesthesiology. Approximately 25 to 30 percent of the interns are graduates of the University of Maryland. From 1969 to the present, training has been conducted at the University of Maryland Hospital and the Baltimore DVAMC. On July 1, 1990, our training program integrated with the residency program at Mercy Medical Center. This integration with a community hospital enhances patient mix and provides trainees with experiences that will prepare them for private practice.

Our postgraduate training program has two tracks. One track, designed for individuals who intend to practice general Internal Medicine, emphasizes ambulatory medicine and experiences in non-internal medicine specialties (e.g., Psychiatry, Gynecology, Ophthalmology, Orthopedics). Approximately six house officers elect this track each year. The other track is more traditional, preparing house staff for the practice of general Internal Medicine, a career in a medical subspecialty, or a career in academic Internal Medicine. The experiences in the two tracks are merging, as we emphasize ambulatory training in both tracks in response to the demands of practice. Dr. Susan Wolfsthal, Director of Ambulatory Medicine Education, has developed programs at physicians' offices, adult day-care centers, and the clinics at the University of Maryland Hospital and the Baltimore DVAMC.

All residents have eight months of elective time and may spend it in medical subspecialties, in nontraditional areas such as Psychiatry or Pediatrics, in a private practice setting, or in research. Approximately 80 percent of the house staff completing training in 1989 went on to additional training in a subspecialty or in general Internal Medicine. Many remain in Maryland following their residency, while others enter fellowships or practices throughout the United States.

Finally, the Department has a major commitment to continuing medical education. At least ten to twelve courses are given annually by the Department's divisions to enrollees from Maryland and surrounding areas. The Department will continue to provide educational opportunities for our community, and benefits from these interactions with colleagues. The Department continues to carry on this longstanding tradition of excellence in the education of students, postgraduate trainees, and practicing physicians in Maryland. ■

# P.I.E.'s quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. P.I.E. Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

## **QRP FACTS:**

**Strict Underwriting Criteria** — Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

## **Scheduled Premium Reductions** —

Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

**High Limits** — Backed by our reinsurer, Lloyd's of London, P.I.E. is able to offer higher coverage limits for qualifying doctors: up to

\$7 million for individual doctors and \$13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

## **Designed With Input from Doctors** —

P.I.E.'s QRP plan is an innovative modified claims-made insurance specially designed with input from P.I.E.-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your P.I.E. representative, or our headquarters office today.

# Improving Preventive Care in General Medical Practice

---

Dorothy A. Snow MD, MPH

---

*Dr. Snow is Assistant Professor of Medicine at the University of Maryland School of Medicine and Associate Chief for Education at the Baltimore Department of Veterans Administration Medical Center. Reprints: Dr. Snow, Office of Medical Education (14A), DVAMC, 3900 Loch Raven Blvd., Baltimore, MD 21218.*

---

*Specific efforts are necessary if physicians are to be in compliance with nationally recognized guidelines for screening, patient counseling, and immunizations. Interventions include the use of checklists, computer reminders, audits with feedback, patient education and reminders, and the use of nursing personnel.*

---

There is a developing consensus in the literature that the targeted periodic health exam should replace the routine "complete history and physical." There is also agreement that preventive health care must focus on screening; patient counseling; and immunizations for conditions, illnesses, and risk factors based on the individual patient's demographic characteristics and lifestyle. The Report of the U.S. Preventive Task Force, *Guide to Clinical Preventive Services*,<sup>1</sup> provides a useful assessment of the effectiveness of 169 interventions, and includes summary tables delineating recommended care. A summary of recommendations for asymptomatic low-risk adults is presented in the Table. The American Cancer Society (ACS) goes further in recommending additional cancer screening with specific recommendations for asymptomatic, low-risk individuals for sigmoidoscopy, fecal occult blood testing, digital rectal examination, and endometrial sampling at specified time intervals. The recommendations of other groups differ in specifics but also emphasize a focused examination.

It is unknown, however, to what extent such guidelines on prevention have reached the mainstream medical community and more importantly, to what degree primary care physicians in office-based practice comply with established recommendations. Available information suggests that levels of compliance with many consensus recommendations are low. Further, it appears that improvements in compliance are not a direct function of physician or provider knowledge with respect to the value of screening or the consensus recommendations. Even physicians' own opinions about optimum interventions do not accurately predict their test-ordering behaviors.<sup>2</sup> Without specific strategies to improve physician compliance, recommended immunizations, screening procedures, and patient counseling are not performed at acceptable rates in a variety of settings, both academic and private.

Academic settings with well-supervised care should provide an optimum site for preventive interventions and high levels of compliance with current recommendations. This, however, is not the case. Mandel et al<sup>3</sup> reviewed the records of a Family Medicine

residents' practice over a five-year period. A written explanation of screening guidelines adopted by the practice was provided in each patient record given to new residents entering the program, but no other encouragement was offered. Although recommended by the practice, it was found that none of the patients over fifty-five had screening sigmoidoscopy, only 53 percent of patients over forty-nine received fecal occult blood testing and only 70 percent of women over eighteen had received Pap smears. Morris and Morris<sup>4</sup> also evaluated preventive practices in a Family Medicine residents' clinic. In this study, forms listing the ACS recommendations for breast examination, mammography, pelvic examination, Pap testing, digital rectal examination, and fecal occult blood testing, as well as the Immunization Advisory Practices Committee recommendations for influenza and pneumococcal vaccines were kept in every resident's examination room. Rates of compliance with recommendations for rectal examinations, Pap smears, mammography, and influenza vaccination were 6 percent, 31.5 percent, 4 percent, and 23 percent, respectively. Another study examining the performance of preventive care in a Veterans Administration Hospital continuity care clinic staffed by Internal Medicine residents found that traditional elements of the periodic health examination were likely to be performed, as over 85 percent of patients had received histories and physical examinations, complete blood counts, electrolytes, chest radiographs, urinalyses, weight measurements, blood pressure determinations, and electrocardiograms. However, compliance was lower for cholesterol screening (51 percent) and for cancer screening procedures (17 to 50 percent). Compliance was lowest for influenza vaccination with only 12.5 percent of high-risk men and none of the high-risk women having received vaccination in the previous season.<sup>5</sup>

The results obtained when evaluating performances by both academic and private physicians are also below standard. In an Internal Medicine faculty practice, McPhee et al<sup>6</sup> evaluated the performance of seven cancer screening tests. Using ACS recommendations for comparison, stool occult blood testing was performed only 28 percent, rectal examination 29 percent, sigmoidoscopy 0.3 percent, Pap smear 22 percent, pelvic examination 28 percent, breast examination 39 percent, and mammography 13 percent of the standards. Four major reasons for not performing the screening tests were given by providers: forgetfulness, lack of time, inconvenience and logistical difficulties, and patient discomfort or refusal. A 1989 survey of 1,029 practicing primary care physicians showed that only 49 percent were routinely performing rectal examinations; 56 percent fecal occult blood testing; 37 percent mammography; 55 percent Pap testing; and 23 percent sigmoidoscopy, in accordance with the ACS guidelines. These results were little changed from a similar survey completed five years earlier, and failure to perform these tests did not reflect simply a disagreement with the testing guidelines.<sup>7</sup>

In an effort to improve the performance of preventive interventions, many strategies have been employed. Among them are checklists, computer reminders, audits with feedback, patient education and reminders, and the use of nursing personnel. These strategies will be discussed below.

### Checklists

Checklists, prompts, or flow sheets attached to charts may serve as useful reminders for physicians to perform appropriate preventive care during a patient visit. Various forms of checklists have been evaluated in a variety of settings and shown to bring about significant improvements in the performance of breast examinations, mammography, and fecal occult blood tests. Advantages of a checklist include low cost and easy implementation. Physicians can design their own form emphasizing preventive interventions determined important or necessary by their own practice. The presence of a checklist or flow sheet also improves the organization of the chart, potentially serving as the problem list for prevention and allowing an indexing of the medical chart.

Disadvantages of a checklist are, first, compliance with filling out the checklist is not uniform. A prospective study was conducted to determine whether screening flow sheets and physician education, combined with other mechanisms, would improve performance of selected health maintenance procedures in a private practice setting. There was a significant improvement in overall compliance with guidelines from 40 percent to 72 percent, but the screening flow sheet, present in all charts, was completed in only 29 percent of patients' charts.<sup>8</sup> The second disadvantage is that initial gains seen in performance may be lost over time.

### Computer Reminders

Computerized medical databases can potentially improve problems in collecting, interpreting, and communicating clinical information. Computerized systems have been developed to allow organization of clinical information and generation of patient-specific reminders with respect to preventive care. Studies which have evaluated the effect of computerized systems on health care delivery have shown improvement in the process of care.<sup>9</sup> In a randomized, controlled trial to evaluate three interventions promoting cancer screening, computer-generated reminders were found to increase performance of six of seven tests audited.<sup>10</sup> Influenza vaccination rates have also been improved with computer-generated reminders.

Advantages of a computerized system include abilities to readily retrieve, organize, and analyze data. Disadvantages include start-up costs for hardware and software, and for transfer of the existing recordkeeping system into the database.

### Audits with Feedback

Chart audits with feedback to the physician have

proven to be an effective tool in improving the performance of a variety of preventive interventions such as influenza vaccination<sup>11</sup> and cancer screening. Audits have proven effective in group practices and academic settings. They may be directed at individual physicians or to groups of physicians. Advantages of audits are that they may serve to educate physicians, may foster discussions about the appropriateness of guidelines adopted by the practice, and may be integrated easily into existing quality assurance programs. Disadvantages include the time-consuming nature of the chart audit and its unsuitability for solo practices.

### Patient Education and Reminders

Patient involvement in preventive health care through the use of reminders and patient education materials has been shown to improve performance of certain preventive interventions. Postcard reminders to patients concerning influenza vaccination in the fall are widely used to increase rates of vaccination.<sup>12,13</sup> Birthday reminders for periodic health screenings are also used. A randomized trial of the effect of patient-carried reminder cards on the performance of health maintenance measures demonstrated effectiveness in improving rates of influenza vaccination, rectal examinations, fecal occult blood testing, Pap smears, and breast examinations.<sup>14</sup> Patient involvement in prevention through questionnaires and patient education has also been shown to improve performance of mammography.<sup>10</sup>

Advantages of patient education and reminders include increased participation of patients in their own health care, ease of implementation of such systems, and advantages to the practice from a public relations standpoint.

### Use of Nursing Personnel

The optimum use of non-physicians in preventive care is, to date, under-explored. It is recognized that nurses can perform some preventive care tasks as well as physicians, and that nurses or other allied health professionals may enhance physicians' efforts. Three strategies to enhance colorectal cancer screening (provider education, chart reminders, and distribution of self-administered fecal occult blood test kits) were evaluated in an Internal Medicine residents' primary care clinic. Only the distribution of the self-administered kits with instructions by nursing personnel resulted in an increase in screening. This study also indicated that screening procedures built into the practice setting through a protocol may have a higher success rate.<sup>15</sup>

A randomized trial in a London general practice specifically addressed the issue of the nurse's role in preventive activities. This study evaluated risk factor ascertainment and follow-up by general practitioners as compared to a general practitioner/health promotion nurse team. The physician/nurse team had significantly higher compliance with all standards examined.<sup>16</sup>

An advantage of the use of allied health professionals is the freeing of physician time for other aspects of medical care. The major disadvantage is that of the financial investment required if these personnel are not already employed.

### Choosing the Interventions

The choice of which preventive measures are to be adopted in a practice should be determined by the nature of the patients, their habits, lifestyles, and, consequently, their major causes of mortality and morbidity. The number of interventions recommended by, for example, the United States Preventive Task Force is lengthy, with many recommendations varying by risk group. In a brief patient encounter, priorities must be set and followed if an impact is to be made by preventive efforts. Clinicians must be aware of the epidemiology of morbidity and mortality within their practice. Examining the leading causes of death by age group (Table) makes it obvious that an approach to prevention must be individualized. In the young adult population where accidents and violence claim the most lives, patient counseling in these areas may be the most important preventive intervention to undertake. Counseling to prevent sexually transmitted disease may markedly reduce morbidity and mortality in this group as well. Emphasis should also be placed on nutrition and abstention from smoking, since coronary heart disease becomes the leading cause of death in the next age group. For individuals over sixty-five years of age, emphasis might be placed on the maintenance of independence and a high quality lifestyle through vision and hearing screens, and counseling on fall prevention. Clearly, the decision about which interventions are to be priorities will differ from one patient and practice to another.

Improving compliance with guidelines for preventive care will only be achieved if physicians recognize the benefits of health maintenance and are motivated to increase preventive services within their practice. When this is combined with strategies to increase adherence to guidelines developed for the specific practice setting, the results may be highly successful.

# Table. Guidelines for the Periodic Health Visit for Asymptomatic, Low-risk Adults, Ages 19 and Over

Schedule: Ages 19-64, every 1-3 years; ages 65 and over, yearly or as noted.

## LEADING CAUSES OF DEATH

### Ages 19-39

Motor vehicle accidents  
Homicide  
Suicide  
Injuries  
Heart disease

### Ages 40-64

Heart disease  
Lung cancer  
Cerebrovascular disease  
Breast cancer  
Colorectal cancer  
Obstructive lung disease

### Ages 65 and over

Heart disease  
Cerebrovascular disease  
Obstructive lung disease  
pneumonia/influenza  
Lung cancer  
Colorectal cancer

## SCREENING

### History

Dietary intake  
Physical activity  
Tobacco/alcohol/drug use

### Over 64 years of age:

Prior symptoms of transient  
ischemic attacks (TIA)  
Functional status at home

### Physical Exam

Height and weight  
Blood pressure

### Over 39 years of age:

Clinical breast exam yearly

### Over 64 years of age:

Visual acuity  
Hearing and hearing aids

### Laboratory/Diagnostic Procedures

Non-fasting total blood cholesterol

### Over 65 years of age:

Pap smear every 1-3 years

### Age 50-75:

Mammogram every 1-2 years

### Over 65 years of age:

Dipstick urinalysis  
Thyroid function test (women)

## COUNSELING

### Diet and Exercise

Fat  
Caloric balance  
Selection of exercise program

### Injury Prevention

Safety belts  
Smoke detectors  
Smoking near bedding or upholstery

### Dental Health

Regular dental visits,  
toothbrushing, flossing

### Substance Use

Tobacco  
Alcohol and other drugs

### Young males:

Violent behavior  
Firearms

### Other

Over 65: Glaucoma testing  
by eye specialist

### Sexual Practices (under 65)

Sexually transmitted disease  
Unintended pregnancy/contraception

### Over 65 years of age:

Fall prevention  
Hot water heater temperature

## IMMUNIZATION

Tetanus-diphtheria (td) booster  
every ten years

### Under 65 years of age:

Influenza vaccine yearly  
Pneumococcal vaccine (one time)

(Adapted from the U.S. Preventive Services Task Force)

*"Nah,  
I've smoked  
for  
30 years.  
It's too late."*

*"I've tried a  
million times,  
but I just  
can't."*

*"I'll  
quit  
next  
week."*

*"I'll quit  
next year."*

*"What difference does  
it make? I'm already  
52 years old."*

*"It's one of the  
few pleasures  
I have left."*

*"I've got  
other things  
to worry about."*

*"The damage  
is done."*

## **They know why they can't. Now tell them how they can.**

Too many older smokers are still making excuses instead of making a determination to quit. And while most of them know about the more common long term effects of smoking, far too few of them know the facts about the immediate health benefits of quitting.

As a doctor, you can play a unique role in getting your older patients who smoke to quit for good. Take a little extra time and educate your patients about the immediate benefits of quitting. Like a decreased risk of heart attacks and strokes. Improved circulation. And most of all, the years they can add to their lives.

So listen to their reasons for not quitting, then go ahead and give them the facts.

**Let them know:  
it's never too late to quit.**

# The HIV Epidemic and the Primary Care Physician

---

Jonathan A. Cohn MD and John W. Warren MD

---

*From the Division of Infectious Diseases, Department of Medicine, University of Maryland School of Medicine, Baltimore, where Dr. Cohn is Assistant Professor of Medicine, and Director of the Adult AIDS Clinical Program and the Maryland AIDS Professional Education Center; and Dr. Warren is Professor of Medicine and Head of the Infectious Diseases Division. Supported in part by Maryland State contract DHMH 90-960G and Grant 5 D35 PE00026-03 through the Health Resources and Services Administration, Bureau of Health Professions, Division of Medicine. Reprints: Jonathan Cohn MD, Maryland AIDS Professional Education Center, University of Maryland Hospital, 22 South Greene St., Box 243, Baltimore, MD 21201.*

---

*It is expected that 80,000 new cases of AIDS will be reported in 1992. Physicians need to equip themselves with knowledge to apply toward case-finding, patient management, and prevention of further spread of the virus.*

---

In response to the HIV (human immunodeficiency virus) epidemic, the Division of Infectious Diseases has developed a variety of AIDS-related (acquired immunodeficiency syndrome) activities. Our Adult AIDS Clinical Program provides coordinated clinical and psychosocial services for HIV-infected persons, and trains our students and house staff in AIDS care. Recently, through funding from the University of Maryland Medical Systems, the Human Resources Services and Administration, and the Maryland Department of Health and Mental Hygiene (DHMH), we created the Maryland AIDS Professional Education Center (MAPEC) in order to include other health care providers in Maryland in our AIDS education efforts. MAPEC's activities include our annual symposium, *AIDS: A Challenge for Primary Care*; lectures and courses for physicians and other health care professionals throughout the State; and clinical training based at the University of Maryland at Baltimore. This article will describe the conceptual basis for our educational outreach program to Maryland's primary care providers.

## Why Primary Care?

Several issues are germane to understanding the involvement of primary care physicians in the care of AIDS patients. One is simply that the large number of patients who are or who will become infected will require the services of a large number of providers throughout the state. Secondly, the nature of HIV disease lends itself to the role of primary care physicians, who traditionally offer their patients continuity and coordination of care in addition to direct medical services.<sup>1</sup> Thirdly, and perhaps most

importantly, the participation of primary care physicians is crucial to the success of HIV-prevention efforts.

*The Epidemiology of AIDS and HIV Infection in Maryland.* Current State regulations require that physicians report both cases of CDC-defined (Centers for Disease Control) AIDS and all patients with symptomatic HIV infection.<sup>2</sup> The data on AIDS cases are more complete than the data on symptomatic HIV infection. Therefore, most of the information on the epidemic in Maryland is based on reported cases of AIDS. According to DHMH, the cumulative number of AIDS cases in Maryland through September 1990 was 2,967.<sup>3</sup> Maryland ranks eleventh in the absolute number of reported AIDS cases among the states and territories, as determined by the CDC.<sup>4</sup> Data from the CDC also indicate that the annual incidence of AIDS in Maryland is 23.2 per 100,000, placing Maryland seventh among the states and territories.

The demographic figures in Maryland differ somewhat from those of the country as a whole. The majority of people with AIDS in Maryland are black (60 percent), whereas nationwide there are more AIDS cases among whites than blacks (55 percent v 28 percent). Homosexuality is the most frequently reported risk factor for men with AIDS in Maryland (62 percent), as it is in the U.S. as a whole (66 percent). Intravenous drug use is the second most commonly reported risk behavior for men in Maryland (22 percent) and the U.S. (18 percent), but intravenous drug use as a percentage of reported cases is rising more rapidly in Maryland than nationwide. The proportion of women with AIDS in Maryland (18 percent) is nearly double the national rate for women (10 percent). Among women with AIDS, the most common risk behaviors, both locally and nationally, are intravenous drug use and heterosexual contact with an intravenous drug-using partner. The prevalence of HIV infection among women giving birth in Maryland rose significantly from 1988 (31 per 10,000 births) to 1989 (42 per 10,000). The HIV-infection rate among black women giving birth in Maryland increased from 74 per 10,000 in 1988 to 107 per 10,000 in 1989. Although most cases in Maryland are still reported from metropolitan areas, every county in the State has reported at least a few cases.<sup>3</sup> The CDC has described national trends of increases in the proportion of minorities, intravenous drug users, and women who are HIV-infected, as well as a wider geographic distribution of cases.<sup>5</sup> These national trends reflect the shifts occurring among AIDS cases in states such as Maryland, where the epidemic is already advanced.

If the present number of men, women, and children with AIDS throughout our State were not enough to demand our attention, the projections for the number of HIV-infected persons in Maryland should. DHMH estimates that there are between 16,000 and 28,000 Maryland residents with HIV infection.<sup>6</sup> This figure is derived from a model using reported cases of AIDS, and will underestimate the HIV epidemic to the extent

that AIDS cases are underreported. Despite this uncertainty, it appears that there are tens of thousands in the State who are infected now, and who now or in the future will require care. Ironically, the majority of them do not know they are infected. Clearly, providing services to these people will require a coordinated effort by all of us. The small number of infectious disease specialists in Maryland will not be able to provide all of the care needed.

*The Nature of HIV Disease.* Ongoing natural history studies of HIV infection have shown that the median incubation period, from acquiring HIV infection to developing CDC-defined AIDS, is ten years.<sup>7</sup> When the epidemic was first recognized eight years ago, only the most advanced disease, AIDS, was diagnosed and treated. Now there are increasing numbers of therapies which can be offered to asymptomatic and mildly symptomatic persons, with the hope of prolonging their survival and improving their quality of life, or both.<sup>8-11</sup> However, for these interventions to be successful, persons with early HIV infection must be identified and receive care over time. Both case-finding and clinical interventions can be performed readily by primary care physicians on an outpatient basis. Without the participation of primary care practitioners, it is difficult to imagine how tens of thousands of persons will be identified and then receive appropriate care over a decade or longer.

As HIV infection progresses from the asymptomatic to the symptomatic stage, multiple organ systems are involved with several kinds of pathological processes. HIV itself has been proven to directly involve the immune and nervous systems, and possibly other organ systems as well.<sup>12</sup> Additionally, the opportunistic infections, cancers, and other syndromes which occur in persons with advanced HIV disease can involve virtually every organ system. Consequently, no one subspecialty can provide all the medical services a person with advanced HIV disease may require. The primary care physician is well placed, however, to coordinate the services of a variety of medical and surgical subspecialists, as well as supportive services for counseling, support groups, or home care.

### **The Role of Primary Care Providers in the HIV Epidemic**

*Prevention.* In the absence of a safe and effective anti-HIV vaccine, the only modes of prevention available are health education and behavior modification. Community organizations and public health agencies have been providing information to the public on HIV transmission.<sup>13,14</sup> Two strategies are in use: one is to provide information to the general public, and the other is to target information to high prevalence areas and persons with high-risk behaviors. These activities are extremely important but will be more effective if combined with one-on-one counseling. Primary care physicians can play an important role in reinforcing public health information so as to prevent their

patients from initiating or continuing high-risk behaviors. The combination of media campaigns and school-based education with physician counseling has been effective in reducing cigarette smoking and dietary intake of saturated fat and cholesterol. Similar programs must be developed to help contain the HIV epidemic. Physicians providing family-planning services must integrate education about HIV transmission into their practices. All physicians should identify patients who have or are developing a drug-dependency problem in order to refer those patients for treatment before they have parenteral exposure to HIV. All physicians must become comfortable and non-judgmental in obtaining sexual and drug-use histories. Counseling by primary care physicians can also have an important role in reducing patients' unwarranted fears about HIV (e.g., in families who are concerned because there is an HIV-infected child in their child's school).

*Case Finding.* Obtaining accurate information on patients' risk behaviors is a necessary step in identifying those persons who are unknowingly infected with HIV. The fifty-two designated HIV-testing and counseling sites operated by DHMH confirmed HIV infection in only 2,138 individuals (4.6 percent of those tested) between 1985 and 1988.<sup>15</sup> This number does not include tests performed by other laboratories around the State. DHMH will be collecting data from hospital and commercial laboratories in order to have a more complete picture of the number of known seropositive individuals. From the currently available information, however, it would seem that the majority of HIV-infected persons in Maryland have not been tested. It is likely that many of those persons are unaware they are infected. They may be unknowingly spreading HIV, and may not be receiving appropriate health care. Some of these infected persons are intravenous drug users who are not receiving routine health care and will only be accessible when they seek episodic care, often for the complications of infection or violence associated with drug use. There are others who are readily accessible to primary care physicians either because they seek routine health care from their provider or because they are seeking care for pregnancy, for sexually transmitted diseases, or for drug addiction. The primary care physician can perform confidential HIV testing and counseling, using the consent form and procedures mandated by the recent AIDS Omnibus Law,<sup>16-19</sup> or they can refer patients to their city or county health department for confidential or anonymous testing. Both the public health and individual patient care will benefit from the widespread participation of physicians in case-finding.

*Management of Asymptomatic HIV Infection.* As noted above, a number of interventions are recommended for asymptomatic HIV-infected persons.<sup>8</sup> Assessment involves identifying other illnesses or infections associated with the patient's lifestyle (such as other sexually transmitted diseases), confirming the absence of signs of HIV disease on exam, and performing

routine laboratory tests (complete blood count and tests of hepatic and renal function), and a CD-4 (T-4, or helper cell) lymphocyte count. A skin test for tuberculosis infection and a serologic test for syphilis are routine. Certain other serological tests are often performed (e.g., hepatitis B, varicella, and toxoplasmosis), and screening for G-6-P-D deficiency may be useful.

Perhaps the most important intervention is counseling on avoidance of further exposure to, and spread of, HIV. Vaccination with the polyvalent pneumococcal vaccine (once) and influenza vaccine (yearly) should be provided. Prophylactic isoniazid (INH) for six to twelve months is indicated for those with previously untreated but inactive tuberculosis infection. Induration of 5 mm or more on a standard strength purified protein derivative is considered positive in HIV-infected patients. Patients with reactive syphilis serology should be assessed for latent neurosyphilis and treated aggressively. Persons who have neither circulating hepatitis B surface antigen nor hepatitis B antibody, yet may have future exposure to hepatitis B, may benefit from the hepatitis vaccine. Prior knowledge of a patient's toxoplasma antibody status is useful if the patient should later develop inflammatory mass lesions of the brain. It is useful to measure varicella antibody in persons without a personal history of chicken pox, because patients with severe immune deficiency and no varicella antibody may benefit from varicella hyperimmune globulin following an exposure to chicken pox.

The CD-4 (T-4) cell count should be determined at least every six months. Among HIV-infected gay men, the CD-4 count falls an average of 105 cells/cu mm annually.<sup>20</sup> Most asymptomatic persons will have CD-4 counts well above 200 cells/cu mm, although some persons will remain asymptomatic despite remarkably reduced CD-4 cell counts. Antiretroviral therapy with zidovudine is usually begun when the CD-4 count falls below 500 cells/cu mm.<sup>9,10</sup> This intervention delays the onset of AIDS. It is expected, but not proven, that this early use of AZT (azidothymidine) will also prolong survival. This use of zidovudine is licensed by the Food and Drug Administration (FDA) and is considered the standard of care by the National Institutes of Allergy and Infectious Diseases, but controversy remains.<sup>21-23</sup> The CDC recommends that prophylaxis for *Pneumocystis carinii* pneumonia be instituted in HIV-infected patients, even if asymptomatic, when the total CD-4 cell count falls below 200 cells/cu mm, using either an oral regimen such as trimethoprim-sulfamethoxazole or aerosolized pentamidine.<sup>11,24,25</sup>

In asymptomatic patients, referral to support groups, for drug treatment, for concrete social services or entitlements, or for legal services may be appropriate even though subspecialty consultation is often not necessary for clinical management.

*Management of Symptomatic HIV Infection.* As symptoms develop, the need for subspecialty consultation will vary with the experience of the primary care provider. Certain symptoms need no intervention and

are merely markers of HIV infection (e.g., persistent generalized lymphadenopathy), whereas advanced symptoms are markers of disease progression (e.g., oral candidiasis, oral hairy leukoplakia, unexplained weight loss with fever or diarrhea).<sup>26</sup> Some symptoms will be readily treatable by the primary care physician (e.g., oral candidiasis, seborrheic dermatitis, folliculitis), whereas management of other syndromes may benefit from subspecialty involvement (e.g., severe thrombocytopenia, psoriasis, renal insufficiency). Most persons with advanced symptoms will have CD-4 counts below 200 cells/cu mm.

Persons with either advanced symptoms or CD-4 counts below 200 cells/cu mm, or both, are at increased risk of developing an AIDS-defining opportunistic infection during the ensuing months, and should receive prophylaxis against *Pneumocystis carinii* pneumonia. Zidovudine has been proven to prolong survival in patients with these clinical and laboratory indications of impaired cellular immunity.<sup>27</sup>

**Management of AIDS.** Similarly, with the severe opportunistic diseases which define AIDS, the need for subspecialty involvement will vary. Some of these, such as *Salmonella* bacteremia, chronic herpes simplex lesions, or esophageal candidiasis, can be diagnosed, at least presumptively, and treated with the technologies directly available to primary care physicians. Others may require the participation of subspecialists for diagnostic procedures (e.g., bronchoscopy, gastrointestinal endoscopy, and other biopsy procedures) or therapy (e.g., respiratory failure and malignancies). Infectious disease consultation becomes important for the management of less common opportunistic infections, for persons with nondiagnostic workups, for those not responding to standard therapies, and for those for whom experimental therapy is considered.

### The Barriers to Care

Health care students, house staff, and practicing professionals have been surveyed about their attitudes regarding HIV infection. Although all of these surveys suffer from bias (i.e., those who return questionnaires are a self-selected group), they do provide information on how some providers feel about the HIV epidemic.

The student surveys with higher response rates probably suffer the least from selection bias. Among second- and third-year medical students in a low prevalence area, Kelly and colleagues found strong evidence of negative attitudes toward homosexuals and AIDS patients.<sup>28</sup> Another survey of senior medical students in a high prevalence area indicated that the majority (56 percent) would prefer to avoid care of HIV/AIDS patients, although a larger majority (63 percent) expected that between 1 and 15 percent of their clinical work would involve HIV/AIDS. Twenty-three percent of these students overestimated the risk of acquiring HIV through a needlestick exposure.<sup>29</sup>

Link et al surveyed 263 medical and pediatric house

officers in seven New York hospitals with large AIDS caseloads to assess their concern about occupational HIV transmission.<sup>30</sup> Forty-eight percent of the medical and 30 percent of the pediatric house officers reported a moderate to major degree of concern. Those who were in earlier stages of their training, those treating a larger number of AIDS patients, and those in Medicine programs had a higher level of concern. Twenty-five percent stated they would not treat AIDS patients if they had a choice. This study did not collect information on other barriers, but in this group of physicians with regular HIV contact, the risk of infection is an issue of major importance.

In a limited survey of members of the Maryland Academy of Family Physicians, 141 of 300 questionnaires have been returned and analyzed to date.<sup>31</sup> Sixty-one percent reported treating at least one HIV-infected patient, and 39 percent reported treating between ten and fifty patients. Thirty-seven percent reported treating at least one patient with severe disease. Ninety-two percent reported being willing to care for patients with asymptomatic infection, and 49 percent reported they would care for those with advanced disease. Of the fifty-eight percent who reported having concerns about treating HIV-infected patients, 69 percent reported that they had insufficient knowledge or training, 21 percent reported being concerned about acquiring HIV infection, and 12 percent reported being concerned that other patients in their practice might object.

The DHMH AIDS Administration conducted a mail survey of all physicians with an active Maryland license. Thirty-six percent of 13,668 physicians responded, and primary care specialties were slightly over-represented among the respondents. Forty-six percent stated that they were currently treating at least one HIV-infected patient, and 53 percent stated that they would accept a new HIV-infected patient into their practice. Physicians were asked if they would treat a patient already in their practice if the patient tested positive for HIV; 73 percent indicated they would continue to treat asymptomatic patients, 60 percent indicated they would continue to treat patients with mild symptoms, and 37 percent indicated they would continue to treat persons with advanced HIV disease.<sup>32</sup>

Discomfort among physicians in treating homosexuals has been noted in some studies, and may translate into a reluctance to treat people with HIV infection.<sup>33</sup> Although not documented, discomfort among physicians in treating intravenous drug users is likely to exist and have an effect on physicians' willingness to provide HIV care.

### Overcoming the Barriers

Public health and professional organizations alike have called on all physicians to provide care for HIV-infected persons. The American Medical Association and the American College of Physicians have done so,

as have the Institute of Medicine of the National Academy of Science and the Presidential Commission on the Human Immunodeficiency Virus Epidemic.<sup>34,37</sup> The Maryland AIDS Omnibus Law specifically forbids discrimination by licensed health practitioners against HIV-infected persons.<sup>16</sup>

Proactive efforts are necessary if these stated policies are to take effect. Many of the barriers can be overcome through education. The knowledge required to treat HIV-infected persons with mild or no symptoms is straightforward. The information required to manage many of the opportunistic infections is readily available in print and in continuing education conferences and courses. The Maryland AIDS Professional Education Center sponsors such courses, and can guide Maryland practitioners to appropriate conferences or reference material (301-328-8639).

An interaction with an HIV-infected person, at a course or clinical training session for instance, usually increases the comfort level of physicians who have not knowingly treated HIV-infected patients.

Many physicians are caring for HIV-infected persons without knowing it. Utilization of universal precautions can decrease the risk for physicians even as they accept known HIV-infected patients for care.<sup>38,39</sup> Education can play a role in countering discomfort in treating homosexuals and in equipping physicians with the skills to care for patients with the multiple problems caused by or associated with intravenous drug use.

Educating physicians in these areas will not be sufficient to allow the provision of services to all HIV-infected persons, nor will it stop the epidemic. Many issues of public policy must be addressed, such as expanded and improved options for treatment of drug use, increased availability of home care and chronic care services, and reimbursement for the care of uninsured or underinsured persons. Nevertheless, physician education, along with the education of students in the health field and other providers, is an indispensable aspect of confronting the epidemic.

## Conclusion

The CDC projects that 80,000 new cases of AIDS will be reported during 1992.<sup>5</sup> That represents the same number of cases which have been reported from the onset of the epidemic through 1988. The health professions and the public have only begun to experience the HIV epidemic. Through the first decade of the epidemic, a great deal has been learned about basic science and patient management. However, during the same period, a great deal of unnecessary suffering has been experienced, due in part to patients' difficulties in obtaining competent and compassionate care. Efforts are underway to develop improved therapies and perhaps a vaccine. In the meantime, primary care practitioners can equip themselves with knowledge to apply toward case-finding, patient management, and most importantly, prevention of further spread of the virus.

# HIV-Associated Nephropathy: Report of a Case and Review of the Literature

---

John Josselson MD

---

*Dr. Josselson is Associate Professor of Medicine, Division of Nephrology, Department of Medicine, University of Maryland Hospital, Baltimore, MD. Reprints: John Josselson MD, Division of Nephrology, University of Maryland Hospital, 22 S. Greene St., Baltimore, MD 21201.*

---

*A case of HIV-associated nephropathy in a thirty-three-year-old black, homosexual male is presented to illustrate the syndrome and serve as a focus for a review of the literature.*

---

**T**he spectrum of renal disease in seropositive human immunodeficiency virus (HIV) carriers and patients with the acquired immunodeficiency syndrome (AIDS) has received increasing attention over the past few years since the initial report by Rao et al<sup>1</sup> in 1984 of a specific form of focal and segmental glomerulosclerosis (FSGN) with an unusually poor prognosis occurring in several patients with the syndrome. The issue of whether HIV-associated nephropathy is indeed a distinct entity has been a recent subject of controversy. The presence of viral-like tubuloreticular inclusion (TRI) particles in the glomeruli of some patients has been suggested as a possible marker of this entity. We report here one such patient, with a review of the literature.

## Case Report

A thirty-three-year-old black male homosexual was admitted to the hospital with a three-week history of nausea, vomiting, pleuritic chest pain and cough with rusty sputum, anorexia, and a forty-pound weight loss over the preceding four months. Three years before, at the time of breast implantation surgery, his serum creatinine was 1.2 mg/dl, and no proteinuria was reported. He denied any prior history of renal disease, hepatitis, venereal disease, or illicit intravenous (IV) drug use, but admitted to occasional use of marijuana and cocaine.

Physical examination revealed a 5'11", 186 lb male, coughing but in no acute distress. Pertinent findings included a blood pressure of 130/90 mm mercury, pulse of 96, respirations twenty per minute, temperature 99.8° F., poor dentition with gingivitis, and decreased breath sounds at both lung bases with scattered inspiratory wheezes. Breast implants were present, no penile lesions were seen, and there was no adenopathy.

Admission laboratory data revealed a hemoglobin (Hgb) of 10.7 gm/dl, a white blood count (WBC) of 4,300, and 3+ proteinuria. The blood urea nitrogen (BUN) was 15 mg/dl and calcium was 7.7 mg/dl. Admission sputum cultures were negative. The chest x-ray revealed a patchy infiltrate in the left lower lung field. The purified

protein derivative (PPD) and trichophyton skin tests were negative. HIV antibodies were positive by enzyme-linked immunosorbent assay (ELISA) and confirmed by Western blot. Antibodies to Hepatitis A and B were present, the fluorescent treponemal antibody-absorption test for syphilis (FTA-ABS) was positive and other immunologic studies were normal or negative. Viral titers, including cytomegalovirus (CMV) and herpes, were insignificant. Lymphocyte cell surface marker studies performed on day fourteen revealed a CD4/CD8 of 0.20.

The patient was begun on intravenous antibiotics, however a low grade fever persisted. Chest x-ray on day seven revealed progression to a bilateral diffuse interstitial infiltrate. On day nine, antibiotics were discontinued and the patient underwent a lung biopsy. At that time his BUN was 29 mg/dl and his creatinine 2.8 mg/dl. A 24-hour urine contained 3.2 grams of albumin. The lung biopsy revealed numerous intra-alveolar organisms typical of *Pneumocystis carinii*. On day ten the patient was begun on trimethoprim-sulfisoxazole intravenously; an intermittent low-grade fever persisted and renal function declined. By day twenty-five, the lung infiltrates had cleared.

A renal biopsy was performed on day twenty-two and revealed mild mesangial hypercellularity and focal global glomerulosclerosis. Thrombi were present in approximately one-third of the examined glomeruli. Interstitial fibrosis and mild mononuclear inflammation were also seen. Immunofluorescence showed 2+ granular mesangial immunoglobulin M (IgM) and C3.

Electron microscopy showed almost complete simplification of epithelial cell foot processes. No immune complex deposition was seen, however very large numbers of TRI particles were seen in glomerular endothelial cells (Figure).

### Discussion

At the onset of the emergence of AIDS as a distinct clinical entity, there was little apparent evidence of

**Figure.** Tubuloreticular inclusions in a glomerular endothelial cell. CL = Capillary Lumen. BM = Basement Membrane.

intrinsic renal involvement. Several large autopsy series<sup>2-7</sup> were noteworthy for the absence of glomerular disease, and in a report from the National Institutes of Health, Balow<sup>8</sup> noted the striking infrequency of severe glomerular changes in a study of fifty patients with AIDS, most of whom were homosexual males and only two of whom were known to have intravenous drug abuse (IVDA) as a risk factor.

In late 1983 and 1984, the first series of AIDS patients with renal pathology were reported from Brooklyn, Manhattan, and Miami.<sup>1,9-12</sup> The study by Rao et al<sup>1</sup> describing eleven patients with proteinuria and/or azotemia, ten of whom had the lesion of FSGN on biopsy and rapid declines in renal function, was the first to suggest a pattern of renal involvement which might be considered to be an AIDS-associated nephropathy. The issue was clouded by the observation that five of their patients were known to have a history of IVDA, itself a risk factor for FSGN,<sup>13</sup> and by two other early reports published by Gardenschwartz<sup>11</sup> and Pardo,<sup>12</sup> who observed a heterogeneity of renal and glomerular lesions in which FSGN was inconstantly seen.

Over time, a clearer picture of the extent of renal involvement with HIV, ARC (AIDS-related complex), and AIDS began to evolve. Rao and colleagues reported a 10.4 percent incidence of renal abnormalities in seventy-five AIDS patients treated in Brooklyn.<sup>14</sup> Twenty-nine percent (23 patients) had clinically diagnosed acute renal failure from AIDS-related complications and its treatment; the remainder (fifty-five patients) had nephrotic range proteinuria with or without azotemia, and half of these had FSGN confirmed by renal biopsy or at autopsy. Bourgoignie, in describing the clinical experience in Miami over five years from 1982 to 1987,<sup>15</sup> reported that renal consultation was obtained in 6.1 percent of 1,635 new patients admitted with ARC/AIDS, and that over the period studied, the percent of patients seen in consultation remained constant despite dramatic increases in the number of new AIDS patients each year. Nephrotic range proteinuria and/or severe azotemia were present in 91 percent of a hundred patients consulted, and of twenty-five patients undergoing renal biopsy, all had FSGN. Another prospective study from the same program,<sup>16</sup> in which renal biopsy tissue or autopsy tissue from 159 patients was examined, revealed a diagnosis of FSGN in thirty-one, and diffuse mesangial hyperplasia in another eleven. Eighty-seven percent of the patients with FSGN were black (including Haitians), 61 percent were male, and 45 percent were at risk from IVDA. In contrast, 54 percent of those patients with mesangial hyperplasia were black, 82 percent were male, and 55 percent were homosexual, with only one intravenous drug abuser.

Contrary to the collective reports from New York and Miami which contain the largest concentrations of HIV/ARC/AIDS patients in the eastern United States, reports from the west coast<sup>17,18</sup> note a lack of FSGN and the AIDS-associated nephropathy described by Rao<sup>1,14,19</sup> and others.<sup>12,15,16,20-23</sup>

It is clear, in retrospect, that patients having intrinsic renal involvement with HIV/ARC/AIDS (excluding that caused by pre-renal factors or acute renal failure) can be categorized on the basis of demographic data into those patients with HIV-associated nephropathy (HIVAN, replacing the term AIDS-associated nephropathy, AAN),<sup>19,24</sup> and those with a heterogeneous collection of glomerular lesions including mesangial hypercellularity<sup>16</sup> and minimal glomerular change.<sup>17,25</sup> Those with HIVAN are more likely to be black (including Haitian), male, heterosexual, and intravenous drug abusers; those with "other" lesions are more likely to be white, male, and homosexual.<sup>16,19</sup> While IVDA is a strong risk factor for HIVAN, 50 percent of patients in several reported series have no history of IVDA, and reports of FSGN in infants and children with AIDS<sup>16,26</sup> support the hypothesis that FSGN seen in the setting of HIV infections can be distinguished from FSGN seen in IVDA. Additionally, several studies now demonstrate that FSGN can be the initial manifestation of an HIV infection in otherwise asymptomatic carriers.<sup>19,24</sup>

Compelling clinical and pathological data now exist which strengthen the demographic findings presented above and support the argument for a distinct HIV-associated nephropathy. FSGN in the setting of IVDA has been well described.<sup>13,27-30</sup> This syndrome is characterized by the development of proteinuria and hypertension with a gradual but stable progression to end stage renal disease (ESRD) over four years in patients with a creatinine clearance exceeding 60 ml/min at diagnosis,<sup>1</sup> and a progressive loss of renal mass leading to small, contracted kidneys. Renal replacement therapy with dialysis or transplantation, permits long-term survival in those patients who can abstain from further addictive behaviors. FSGN in the setting of ARC/AIDS behaves quite differently clinically, whether or not the patient is a drug abuser. While nephrotic range proteinuria is the rule, hypertension is notably absent,<sup>23,31</sup> kidneys are enlarged on ultrasound<sup>32</sup> and at autopsy,<sup>16</sup> and progression to ESRD is rapid over weeks to a few months,<sup>1,20-21,23</sup> followed by early death, whether or not dialysis is employed.

The pathologic picture of FSGN, whether idiopathic<sup>33</sup> or associated with IVDA<sup>13,27-30</sup> has been well characterized. While the initial reports of HIVAN emphasized the similarities of the FSGN in these three distinct settings, a number of morphologic features associated with HIVAN now appear to distinguish it as a distinct entity. The most striking observations are an increase in mesangial hypercellularity,<sup>34</sup> tubular microcystic dilatation,<sup>34-35</sup> and the presence of TRI in glomerular endothelial cells (Figure), and interstitial cell cytoplasm<sup>34-37</sup> analogous to "viral-like" particles initially described in renal tissue from patients with systemic lupus erythematosus<sup>38</sup> and the "vesicular rosette" originally described in lymphoid tissue of AIDS patients.<sup>39</sup> The presence of TRI in large quantities suggests the role of a viral mechanism for HIVAN,<sup>34,36-37</sup> and there are some data to support this

hypothesis. Cohen was able to identify HIV dioxynucleic acid (DNA) in glomerular and renal tubular epithelial cells in HIVAN,<sup>40</sup> and Rao<sup>19</sup> recently reported the presence of p24 antigen in the immune complexes of one homosexual male with an HIV infection and membranous glomerulonephritis. Although other studies have failed thus far to identify viral antigens in glomeruli,<sup>41</sup> these reports raise the possibility that HIV may be directly glomerulo- and tubulo-toxic.<sup>42</sup> The recent development of an animal model of HIVAN<sup>43-44</sup> may shed light on this hypothesis.

The epidemiologic, clinical, and pathologic evidence summarized in this brief review unequivocally support the existence of HIV-associated nephropathy. The patient presented here well illustrates the unique features of this entity. As the incidence of HIV infections in intravenous drug abusers and their sexual contacts continue to increase in Maryland, it may be anticipated that this syndrome will become much more visible.

*Knowledge concerning the structure of the human gene preproTRH makes possible studies of its regulation by hormones and other factors such as cyclic adenosine monophosphate (AMP).*

---

What keeps us eternally young in Endocrinology is our ever-changing concept of disease. This has been well-dramatized by the history of the University of Maryland's Endocrinology and Metabolism Division. The first Division head appointed in 1956, Dr. Thomas B. Connor, established a reputation as an outstanding clinical investigator in the areas of calcium metabolism and metabolic bone disease, as well as by his innovative contributions in renovascular hypertension. Dr. Connor was the first investigator to postulate the probable role of tumor hormonal factors mediating the hypercalcemia of malignancy.<sup>1</sup>

Since that time, a major revolution in the biological sciences has occurred through developments in molecular biology and recombinant deoxyribonucleic acid (DNA) technology. This new biology, begun in the 1960s with the discovery of DNA structure and the genetic code for amino acids, has been widely applied in all domains of Endocrinology. This article focuses on a specific application of this new molecular biology to an area of human neuroendocrinology being carried out by the author and his co-workers. The research program centers around characterization, expression, and regulation of the gene for human thyrotropin-releasing hormone (TRH), the major regulator of pituitary thyrotropin (TSH) synthesis and secretion. Both thyroidal growth and the secretion of thyroxine ( $T_4$ ) and triiodothyronine ( $T_3$ ) from the human thyroid, in turn, are stimulated by TSH.

In 1969, TRH was the first hypothalamic hormone to be isolated.<sup>2</sup> At first, TRH was thought to be localized only in the hypothalamus and to function exclusively as a regulator of pituitary TSH secretion. Our group and others, however, have demonstrated that TRH is also present throughout the entire brain including the spinal cord, and in the pancreas.<sup>3</sup> In these locations, TRH subserves new, non-endocrine functions as a central nervous system neurotransmitter and neuromodulator, and in the pancreatic islets, as a precursor for a dipeptide inhibitor of insulin and glucagon secretion. The secretion of pituitary TSH

is regulated not only by the inhibition by  $T_3$  of TRH stimulation of pituitary TSH release, but also by inhibiting TRH gene transcription itself in the brain's hypothalamus.<sup>4</sup> We decided that it was crucial to isolate the human gene encoding the precursor protein containing the TRH molecule in order to elucidate how thyroid hormones actually regulate TRH gene expression. Such studies of TRH gene regulation would provide a model for new insights into how thyroid hormone acts at the level of the gene, and will also help to further understanding as to how other hormones act at the molecular level; this is because estrogens, progesterone, aldosterone, testosterone, vitamin D, and retinoic acid, like thyroid hormones, act by attaching to a structurally-related superfamily of intracellular hormone-binding proteins, which then attach to DNA receptors to enhance or restrain gene expression.<sup>5</sup>

Our group has successfully cloned and characterized the gene for human preproTRH and the corresponding complementary DNA (cDNA) in the hypothalamus.<sup>6</sup> The human gene was isolated from a human lung fibroblast genomic library after screening two million plaques with a  $^{32}P$ -probe specific for the homologous rat preproTRH gene, chosen because it encoded gene sequences likely to be similar to those in the human gene. A single DNA clone, 15 kilobases (Kb) in size, was identified and isolated. A smaller fragment within this clone (4.8 Kb), containing the entire human TRH gene, was then subcloned into a plasmid vector for DNA sequencing.<sup>6</sup> It can be seen in the lower restriction endonuclease map of the TRH gene (Figure 1) and in the upper schematic diagram of the cDNA corresponding to the exons of the human TRH gene, that there are three exons with two intervening introns of 1050 and 650 bp, respectively, in this human gene. It is remarkable that the human gene is a multicopy gene, containing six identical copies of TRH coding sequences within the third exon, shown by the black bars. This has fascinating implications because during the proteolytic processing of the human preproTRH precursor protein, not only will six TRH molecules be generated, but seven intervening peptides will also be formed with predicted functions as neurotransmitters and neuro-modulators in the central nervous system, and possibly in other extraneural locations as yet unknown.

The human gene for TRH exhibits 73.3 percent and 59.5 percent homology with the rat TRH gene at the nucleic acid and protein levels, respectively. Studies of potential

homology with other protein hormone genes have revealed that the human preproTRH gene enjoys 52 percent homology with the human chromogranin A gene, implying that these two genes have originated from a common ancestral gene during evolution. This is of interest as chromogranin A is present in many endocrine tissues including the pituitary gland, the thyroid gland, the hypothalamus, the adrenal medulla, the pancreas, medullary carcinoma cells, and in hormone-producing small cell carcinomas of the lung.

Recently, we have demonstrated that thyroid hormones reduce TRH messenger ribonucleic acid (RNA) levels in a selected region of the rat hypothalamus, implying that there is a thyroid hormone inhibitory regulatory element located in the TRH gene.

Our group has searched carefully in the 5' flanking region of the human TRH gene for a potential thyroid receptor element (TRE), and found that an eight-base sequence, GCCAGTGC (at bp -183 to -190 upstream from the start of gene transcription), is identical to sequences in both the human and rat TSH genes which are also under inhibitory control by thyroid hormones. The conservation of these identical sequences in three different hormone genes, all inhibited by  $T_4$  and  $T_3$ , strongly suggest they are important for inhibitory regulation by thyroid hormones, through the specific intracellular  $T_3$  binding proteins (hErbA proteins) that attach to these DNA recognition sites.

Studies are in progress to determine whether thyroid hormones can inhibit the transcriptional activity of the human preproTRH gene. To explore this question, we

**Figure 1.** Structure of the human preproTRH cDNA and gene, and sequencing strategy. The top line shows a schematic diagram of the human preproTRH cDNA, indicating the 5' untranslated region (5' - UT), the signal peptide, the preproTRH encoding region, the 3' untranslated region (3' - UT), and the poly(A) tail (solid line). The solid boxes represent the TRH coding sequences. The bottom line shows a representation of the human preproTRH genomic gene. Exons are represented by open boxes. Vertical connecting lines indicate relationships between structural regions of the cDNA and exons of the genomic DNA. The horizontal arrows beneath the genomic DNA denote the direction and extent of sequence determinations.

have incorporated the regulatory portion of the gene (the 5' flanking region, from base pair -900 to +54) into a plasmid (a circular double-stranded DNA form) containing the firefly luciferase enzyme, which in nature generates light by chemiluminescence. When the human TRH gene in this plasmid is transfected into an appropriate tissue-cultured cell line, the amount of light generated in a test tube can be measured to reflect quantitatively the amount of TRH gene promoter activity.

We have discovered that two different 5' deletion mutants (-600 to +54) and (-250 to +54) show substantial and progressive loss of gene activity as compared to the full wild-type mutant (-900 to +54) (Figure 2). Most interestingly, the addition of  $T_3$  into the cell culture medium at physiological concentrations for man ( $10^{-9}M$ ) causes marked inhibition of TRH gene expression (Figure 3). In striking contrast, only slight and insignificant inhibition was produced by  $T_3$  when the plasmid contained another non-TRH viral promoter (SV<sub>40</sub>) in the absence of the specific TRH DNA sequence (-900 to +54 bp). From these studies, we infer that the human preproTRH gene, strongly expressed in tissue-cultured cells, has at least two promoter elements between bases -900 and +54 of the preproTRH gene. Moreover,  $T_3$  can inhibit the expression of the TRH gene directly, confirming that thyroid regulation in man is accomplished not only at the level of the pituitary but also at the level of the hypothalamus by blocking DNA transcription of specific TRH messenger RNA.

The availability of the complete human gene for TRH makes possible, for the first time, the identification of potential abnormalities in TRH gene structure in patients with hereditary deficiency of TRH (tertiary hypothyroidism). As a first step toward elucidation of such genetic abnormalities, we have investigated the chromosome localization of this gene, using human-hamster cell hybrids containing one of each of the human chromosomes (the 22 autosomes, and the X and Y chromosomes). We localized the gene with a  $^{32}P$ -cDNA probe specific for human

preproTRH. We have been able to establish that this radioactive probe hybridized with only a single DNA band derived from human white blood cells after DNA digestion with the restriction endonuclease (EcoRI), confirming that the human gene is a single copy gene. Moreover, under identical conditions, no hybridiza-

**Figure 2.** Progressively diminished preproTRH gene promoter activity is expressed on the horizontal axis in light units per  $10\mu g$ /protein. The three 5' flanking region mutants were ligated into fusion plasmids also containing the enzyme luciferase. The number of DNA base pairs are shown on the vertical axis, and luminometer light units/ $10\mu g$  protein from cell lysates are shown on the horizontal axis.

**Figure 3.** The effect of L- $T_3$  *in vitro* upon the activity of the fusion plasmid construct preproTRH (5' flanking region) - luciferase transfected into rat pituitary cells. Significant inhibition of gene activity was seen at all L- $T_3$  concentrations from  $10^{-11}$  to  $10^{-9}M$ , and at  $10^{-9}M$ ; the inhibition was -71 percent,  $p < 0.001$ . The right-hand bar labelled "0" represents the wild-type gene, whose 5' flanking region was complete (-900 to +54 bp).

**ADVANCED MRI DIAGNOSTICS  
FOR THE BALTIMORE-WASHINGTON  
CORRIDOR MEDICAL COMMUNITY**

7120 Contee Road  
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- Excellent suburban location;
- A radiologist is available for professional consultation;
- Immediate reports;
- A FAX is on site for scheduling or processing reports;
- We hand deliver duplicate films to your office.
- Evening hours available.

Most Maryland area insurers cover MRI.

**TO SCHEDULE APPOINTMENTS FOR YOUR  
PATIENTS, CALL US AT (301) 725-8995.**

tion occurred with hamster cell DNA, documenting the suitability of the hybrid cell system for human gene localization.

We then performed hybridizations with DNA from twenty-nine of these cell lines after digestion of their DNA with the restriction enzyme EcoRI. We correlated the presence or absence of a specific human chromosome with the hybridization signals generated. Statistical analysis indicated complete concordance between the preproTRH gene and human Chromosome 3.<sup>7</sup> The assignment to human Chromosome 3 of the TRH gene is of particular interest as this chromosome also contains the gene for one of the binding proteins for T<sub>4</sub> and T<sub>3</sub> involved in the regulation of gene transcription. Moreover, future mapping of the human preproTRH gene to a specific locus within Chromosome 3 will facilitate genetic analysis of DNA derived from WBCs of patients with hereditary TRH deficiency.

In conclusion, knowledge concerning the structure of the human gene preproTRH makes possible studies of its regulation by hormones and other factors, such as cyclic adenosine monophosphate (AMP). Moreover, because there is only a single preproTRH gene copy in man, studies of potential abnormalities in its structure or regulation can now be undertaken easily in patients with hereditary TRH deficiency by extracting their WBC DNA, identifying any mutations present in the TRH gene sequence, and establishing

that the mutant gene, unlike the normal TRH gene, is not able to transcribe RNA for TRH synthesis and actions. As our studies of expression and regulation of the human TRH gene progress, we hope to uncover new locations of TRH RNA even beyond those already known, stimulating new questions and research about this fascinating, multicopy gene and its multifunctional hormone product, TRH.

*Considerable progress has been made in the past decade in developing vaccines against the most important bacterial and viral infections of the gastrointestinal tract.*

---

The fundamental objective of the Division of Geographic Medicine in the Center for Vaccine Development (CVD) is to carry out research related to the control of major communicable diseases, particularly enteric infections, by means of immunizing agents. The pursuit of such an undertaking requires a multidisciplinary approach to the development and testing of new and improved vaccines. Research at the CVD begins with basic molecular genetics and biotechnology that generate new vaccine candidates; continues through small clinical trials in volunteers, testing for safety and immunogenicity; and concludes with large-scale, randomized, controlled trials to evaluate the protective efficacy of vaccines in the field.

Currently, the CVD conducts research on vaccines against the enteropathogens causing cholera, typhoid fever, dysentery, traveller's diarrhea, and infant diarrhea. Scientists at the CVD also test the pathogenicity of suspected new enteropathogenic agents. In addition, the CVD is investigating vaccines against AIDS, malaria, hepatitis, pertussis, *Haemophilus influenzae* type B, and selected gram-negative bacilli.

This review will focus on vaccines against several important enteropathogenic agents of special interest to many of the Center's nineteen faculty and sixty staff members. We will summarize the important contributions made by CVD investigators to the prevention of these enteric infections, research that began fifteen years ago with the founding of the CVD. Included in our discussion will be vaccines against *V. cholerae*, *Salmonella typhi*, *Shigella*, enterotoxigenic *Escherichia coli*, and rotavirus.

## Background on Vaccines Against Enteric Pathogens

Enteric infections causing secretory diarrhea, dysentery, and enteric typhoid fever are an important public health problem worldwide.<sup>1-3</sup> Since the early 1970s, many new viral, bacterial, and protozoal agents causing these afflictions have been identified.

The list of enteropathogens has lengthened so markedly in the past fifteen years that one might ask whether a score of different vaccines might be necessary to prevent endemic pediatric diarrhea and traveller's diarrhea. Fortunately, only a relative handful of etiologic agents account for the vast majority of clinically and epidemiologically important illnesses. For example, a small number of bacterial agents, including enterotoxigenic *Escherichia coli*, enteropathogenic *E. coli*, *Shigella*, and *Vibrio cholerae* 01, and one virus, rotavirus, combine to cause a major proportion of the diarrheal illness of public health importance worldwide, while *Salmonella typhi* is by far the major cause of enteric fever. If safe and practical vaccines existed that were effective against just these agents, much of the disease burden due to enteric infections could be reduced.<sup>4</sup> The status of vaccines against these various enteropathogens will be reviewed here, emphasizing those vaccines that have reached the stage of licensure, controlled field trials of efficacy, or early clinical trials for safety and immunogenicity in volunteers.

### Vaccines Against Typhoid Fever

**Inactivated Whole Cell Typhoid Vaccines.** Inactivated *S. typhi* parenteral vaccines have been licensed and used for many decades. While they provide greater than 80 percent protective efficacy against typhoid fever, they are not ideal for immunizing children in endemic areas, or travelers to endemic areas, because they often cause rather severe febrile reactions and induce inflammation at the site of vaccination.<sup>4</sup>

**Ty21a, Live Oral Typhoid Vaccines.** As a result of adverse reactions caused by parenterally-administered, inactivated typhoid vaccines, an attenuated strain of *S. typhi*, Ty21a, was developed at the Swiss Serum and Vaccine Institute by chemical mutagenesis of a pathogenic *S. typhi* strain.<sup>5</sup> Placebo-controlled clinical trials of this live, orally-administered vaccine have shown it to be free of local gastrointestinal or systemic side effects while offering considerable protection. Among the first human studies were those carried out at the Maryland State Prison at Jessup by University of Maryland investigators.<sup>6</sup> Since those successful pioneering trials in adult volunteers, several large field trials of Ty21a have been conducted in Alexandria, Egypt<sup>7</sup> and in Santiago, Chile.<sup>8,9</sup>

In the first field trial of efficacy conducted in Alexandria, Egypt, 32,000 school children, six to seven years of age, were randomized to receive three doses of vaccine within one week. The children were fed a liquid formulation containing between one to three billion vaccine organisms per dose.<sup>7</sup> Because the Ty21a organisms are rather rapidly killed by gastric acid, the children chewed a 1.0 gram tablet of NaHCO<sub>3</sub> several minutes before ingesting the vaccine or placebo to neutralize gastric acid. Thus the organisms were protected and able to enter the small intestine where they were taken up by Peyer's patches. Here they replicated for several days and immunized the host

before the genetic mutations in the Ty21a strain eventually led to their self-destruction.

During three years of surveillance in Egypt, Ty21a provided 96 percent protective efficacy against confirmed typhoid fever. Based on these promising results, the Swiss Serum and Vaccine Institute prepared two more easily administered vaccine formulations for trial in Chile by CVD investigators who tested 109,000 children.<sup>8</sup> One formulation consisted of gelatin capsules containing lyophilized vaccine and NaHCO<sub>3</sub>; the second formulation consisted of lyophilized vaccine in enteric-coated capsules which are stable for several hours in gastric acid and open only at a pH of 6.5. The enteric-coated capsules were significantly superior to the gelatin capsules, both given as three doses within one-week or at twenty-one-day intervals. Three doses of Ty21a in enteric-coated capsules have provided 65 percent efficacy for at least five years with no sign yet of diminishing protection.<sup>9</sup> In another field trial in Santiago by CVD and Chilean investigators, four doses of Ty21a vaccine were superior to two or three doses.<sup>10</sup> Because of its exceptional safety, ease of administration, proven practicality for large-scale vaccinations, and moderate efficacy for at least five years, Ty21a has become a public health tool for control of endemic typhoid and an attractive option for immunizing travelers. The vaccine was licensed in the United States in December 1989, and is available in the form of enteric-coated tablets taken every other day for four doses.

**Purified Vi Polysaccharide Vaccines.** Virtually all strains of *S. typhi* isolated from patients with acute typhoid fever have a polysaccharide capsule antigen on their surface, the Vi antigen. Purified Vi as a parenteral vaccine was first tested for safety and antigenicity in Maryland volunteers at the CVD.<sup>11</sup> Since then, purified Vi has been given as a parenteral vaccine in recent field trials in Nepal<sup>12</sup> and South Africa.<sup>13</sup> The vaccine was well-tolerated and provided 72 percent and 64 percent protection lasting for seventeen months and twenty-one months, respectively, against typhoid fever. An advantage of the Vi vaccine is that it provides a moderate level of protection after a single dose. Attempts are underway to further refine the Vi vaccine and improve its potency.

### Vaccines Against Cholera

Inactivated whole-cell parenteral vaccines have been used for the past ninety years. Unfortunately, licensed vaccines are highly reactogenic and protect older children and adults only for a few months. Because *V. cholerae* does not invade the intestinal wall and secretory immunoglobulin A (SIgA) is thought to be the critical mediator of immunity, modern approaches to improve cholera vaccines have focused on oral vaccines to more efficiently stimulate SIgA intestinal antibody.

**Nonliving Oral Cholera Vaccines.** Investigators at the CVD first successfully tested two nonliving oral vaccines in Maryland volunteers. The vaccines consisted of killed whole vibrios or whole vibrios in combination

with the B subunit of cholera toxin (the immunogenic nontoxic portion of the cholera toxin molecule).<sup>14</sup> Subsequently, a large-scale, placebo-controlled field trial in 62,285 Bangladeshis showed that three doses of the vaccines provided 50 to 52 percent efficacy overall at three years of follow-up, with efficacy in young children (23 to 26 percent) considerably lower than in older persons (63 to 68 percent).<sup>15</sup>

The inactivated oral vaccines represent a major improvement in protection against cholera. They confirm the rationale for use of the oral route of immunization and demonstrate that improved vaccines can provide several years duration of protection against cholera. However, these vaccines suffer from two drawbacks: young children are not protected well, and multiple-spaced doses must be administered to elicit protection. Several live oral cholera vaccines have been developed in an attempt to overcome these weaknesses of the oral killed vaccines.

**Live Oral Cholera Vaccines.** The CVD has participated in the development and testing of several live, attenuated cholera vaccine candidates.<sup>16-19</sup> To date, the more promising vaccines have been prepared by deleting the genes encoding the A subunit of cholera toxin from known pathogenic strains of *V. cholerae* 01,<sup>18,20</sup> leaving in place other *V. cholerae* virulence factors which immunize the host without causing clinically important diarrhea. One such genetically engineered strain, CVD 103, produced no cramps and only a very mild diarrhea in six of fifty-two individuals who ingested a dose of 10<sup>8</sup> organisms. In experimental challenge studies in Maryland volunteers, a single oral dose of CVD 103 provided significant protection against challenge with pathogenic *V. cholerae* 01 strains.<sup>19</sup>

In order to study cholera vaccines in countries where cholera is endemic, a way must be found to distinguish vaccine strains from strains of wild vibrios. Dr. J. Kaper at the CVD accomplished this by encoding resistance to Hg<sup>++</sup> into the chromosome of the vaccine strain. This further-modified strain, CVD 103-HgR, produced loose stools in only three of 127 Maryland volunteers, elicited antibody responses equal to its parent CVD 103, and provided significant protection against experimental challenge.<sup>19</sup> Importantly, the serological responses in Maryland volunteers following a single oral dose of CVD 103-HgR were significantly higher than those after three spaced oral doses of the B subunit/killed whole cell vaccine, thereby demonstrating superiority of the living vaccine for use in the field. Clinical trials for safety and immunogenicity with CVD 103-HgR are in progress in Thailand<sup>21</sup> and Indonesia using a practical formulation consisting of lyophilized vaccine organisms and a buffer powder. If safe and immunogenic in children living in less-developed countries, the vaccine will be tested in large-scale field trials for protective efficacy.

### Shigella Vaccines

Killed *Shigella* organisms inoculated parenterally

stimulate high levels of circulating antibody but fail to protect man from challenge with virulent *Shigella*. By contrast, attenuated strains of *Shigella* were developed as live oral vaccines in the 1960s. Although protective in some instances, most of these early vaccine candidates suffered from drawbacks, such as the requirement for multiple doses, the necessity to administer an annual booster to maintain protection, genetic reversion to virulence, and dose-related vomiting.

The newest generation of live oral *Shigella* vaccines are under clinical trial at the CVD. In these vaccines, selected genetic elements of virulent *Shigella* species are introduced (cloned) into nonvirulent strains of *Salmonella typhi*<sup>22-23</sup> or *E. coli*.<sup>24</sup> These laboratory-altered carrier strains colonize or infect the bowel without producing illness and express the antigens coded by the *Shigella* genes they carry, thus quietly inducing an immune response in the host. Studies are underway at the CVD to determine if these immune responses protect the vaccinee from disease caused by virulent *Shigella* challenge.

### Vaccines Against Enterotoxigenic Escherichia Coli

Evidence from both volunteer studies and epidemiological surveys shows that prior infection with enterotoxigenic *E. coli* (ETEC) confers immunity. Protection is believed to be mediated by secretory IgA antibody directed against *E. coli* fimbrial colonization factors and against heat-labile enterotoxin (LT). Vaccine candidates of several types, including both nonliving antigens and live oral strains, attempt to stimulate antitoxin and antifimbrial antibody. The toxin antibody prevents the large mucosal fluid flux induced by toxin, and the fimbrial antibody interferes with the ability of ETEC to colonize the gut mucosa.

**Nonliving Antigens as Oral Vaccines.** Synthetic *E. coli* toxoid stimulated antitoxin in serum and intestinal fluid of volunteers,<sup>25</sup> but protective efficacy of these toxoid vaccines has not yet been determined. The killed whole vibrio/B subunit combination oral vaccine recently field-tested in Bangladesh provided significant protection against diarrhea caused by LT-producing ETEC during the initial three months after vaccination.<sup>26</sup> This brief protection was apparently based on the strong antigenic similarity between the B subunit of the cholera toxin in the vaccine and the B subunit in LT secreted by virulent ETEC.

Purified ETEC fimbriae were antigenic in Maryland volunteers when introduced directly into the duodenum via an intestinal tube, thereby bypassing inactivation by stomach acids.<sup>27</sup> New delivery systems under test by CVD investigators that can protect protein antigens from gastric juice but allow their release in the small intestine may stimulate interest in such delicate, purified vaccines given by mouth.

**Live Oral ETEC Vaccines.** A novel ETEC strain that elaborates colonization fimbriae but not toxin, induced a prominent intestinal SIgA antifimbrial an-

tibody response in Maryland volunteers.<sup>27</sup> The vaccine protected volunteers against bowel colonization and diarrhea after challenge with a virulent ETEC strain expressing the same fimbriae contained on the vaccine strain. For future *E. coli* vaccine trials, attenuated ETEC strains are being constructed that express various colonization factor antigens and toxoid antigens.

### Vaccines Against Rotavirus

Progress has been made in the development of live oral rotavirus vaccine candidates despite uncertainty regarding the mechanisms of protection against rotavirus infections in humans.<sup>28</sup> A number of rotavirus strains isolated from rhesus monkeys or calves, and naturally attenuated for man, have entered into pediatric trials worldwide.<sup>29-32</sup> These trials revealed that mild fevers occur in 30 percent of vaccinated infants four to nine months of age, but not in younger infants. The animal rotavirus vaccine strains provide significant protection against diarrhea caused by virulent human rotavirus strains sharing the same serotype found in the vaccine,<sup>33</sup> but inconsistent protection against wild strains bearing other serotypes.<sup>34</sup>

Because serotype-specific protection against the four human rotavirus serotypes may be required, vaccines containing the four serotypes combined into a polyvalent vaccine have been developed.<sup>35</sup> These tetravalent rotavirus vaccines are under study in efficacy trials being conducted by a network of investigators worldwide.

Once the safety and efficacy of a rotavirus vaccine candidate has been established, a series of additional practical issues must be resolved. These issues include determination of the buffer to neutralize gastric acid, whether rotavirus vaccine can be given concomitantly with polio vaccine without diminishing the take of each vaccine, the optimum dose and schedule of the rotavirus vaccine in the presence and absence of breast-feeding, and the heat stability of the vaccine.<sup>34</sup>

### Summary

Considerable progress has been made in the past decade in developing vaccines against the most important bacterial and viral infections of the gastrointestinal tract. Members of the Division of Geographic Medicine in the Center for Vaccine Development have played a prominent role in the laboratory development and clinical testing of these vaccines. A new oral typhoid vaccine, Ty21a, has been licensed in the United States. A genetically engineered live oral cholera vaccine developed in the CVD is undergoing clinical trials in cholera-endemic areas. Multiple vaccine candidates against *Shigella*, enterotoxigenic *E. coli*, and rotavirus are in clinical trial in the United States or overseas. Rapid advances in molecular biology, together with new knowledge of mucosal and cellular immunity, will produce more vaccine candidates in the

future. The CVD intends to be in the forefront of these developments.

*“I have first-hand knowledge of the level of professionalism of Meridian’s staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents.”*

Theodore C. Patterson, M.D., Medical Director,  
Meridian Nursing Center—Heritage

#### **Partners in Healthcare**

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer’s patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there’s our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

*Gastroenterologists are now able to use fiberoptic endoscopy to stop life-threatening hemorrhages, to apply laser beams to ablate nonresectable obstructing cancers, and to relieve biliary tract obstruction.*

---

Gastroenterology as a subspecialty of Internal Medicine has undergone a dramatic metamorphosis in the past decade. Limited to antacids, steroids, and antidiarrheal agents in the past, gastroenterologists today are able to use fiberoptic endoscopy to stop life-threatening hemorrhages in the gastrointestinal tract, apply laser beams to ablate nonresectable obstructing cancers of the esophagus and rectum, and remove common bile duct stones to relieve biliary tract obstruction. While research in gastroenterology ten years ago centered around studies of gastric acid secretion and ionic fluxes in the small intestine and colon, investigators are now using techniques of molecular and cell biology to investigate basic questions of carcinogenesis in the gastrointestinal tract and important clinical problems such as the increased propensity of cigarette smokers to develop peptic ulcer disease. This manuscript provides the reader with an update on some of these exciting new developments in clinical and investigative gastroenterology.

## Invasive Biliary Tract Endoscopy

The ability to perform endoscopic cannulation of the ampulla of Vater introduced a new era of nonoperative visualization of the pancreas and biliary tree. Diagnostic endoscopic retrograde cholangiopancreatography (ERCP) supplements radiographic visualization of liver and pancreatic anatomy by sonography and computerized tomographic scanning and often provides information that could otherwise be obtained only at laparotomy. In recent years, indications for ERCP have evolved as a range of related therapeutic techniques have been introduced. Sphincterotomy of the ampulla for gallstone removal and endoscopic insertion of stents into the biliary tree to relieve obstruction enable gastroenterologists to endoscopically treat patients who previously would have required surgical intervention. Endoscopic sphincterotomy (ERS) is performed using electrocautery to make a small

incision through the muscle fibers of the sphincter of Oddi. ERS was initially reserved for patients without a gallbladder who had common bile duct stones after a cholecystectomy or in whom stones formed years later in the common bile duct (Figure 1). More recently, however, ERS has been used in high-risk patients with common bile duct stones and intact gallbladders when the expected surgical mortality and morbidity of cholecystectomy and common bile duct exploration are judged to be high. Furthermore, it is now recognized that an ERS may be lifesaving in cases of severe acute gallstone pancreatitis by permitting passage of the stone producing the pancreatitis.<sup>1</sup> Similarly, acute cholangitis due to gallstone obstruction of the common bile duct was regarded as a relative contraindication to ERCP in the past. However, this diagnostic procedure coupled with sphincterotomy is now considered preferable to surgical intervention.

Obstructive jaundice due to pancreatic or cholangiocarcinoma is another difficult clinical problem which can be addressed with therapeutic biliary endoscopy. Pancreatic cancer is rarely resectable due to its advanced nature by the time a clinical diagnosis is made, and palliative relief of biliary obstruction is often desirable. Recent evidence suggests that both surgical decompression of malignant biliary obstruction and percutaneous biliary stent insertion carry a higher morbidity and mortality rate than endoscopic stenting of the bile duct.<sup>2,3</sup> In the latter procedure, a sphincterotomy is performed and a large hollow tube which bridges the obstructing tumor is passed through the endoscope into the bile duct. Bile also flows through the tube into the duodenum so both obstruction and jaundice are relieved. The procedure can be performed

under light intravenous sedation with an overnight hospital stay and offers a dramatic improvement in the quality of a patient's life with minimal risk or disruption of daily routine.

A recently developed diagnostic capability of ERCP is biliary manometry for evaluation of post-cholecystectomy syndrome. Many patients develop abdominal pain after gallbladder surgery which is very similar to preoperative clinical symptoms. This pain may be due to dysfunction of the sphincter of Oddi (also known as biliary dyskinesia), papillary stenosis, or stenosing papillitis. Such patients have traditionally been very troublesome to evaluate and treat; generally patients have undergone extensive testing and therapeutic trials, all with negative results, before the correct diagnosis is made. Using a technique pioneered by Greenen,<sup>4</sup> biliary manometry can provide a definitive diagnosis of biliary dyskinesia. A pressure transducer is introduced into the bile duct via the ampulla using an endoscope, and pressure measurements are made in the sphincter of Oddi. If pressures are high in frequency, amplitude, or duration, a diagnosis of sphincter-of-Oddi dysfunction is made. ERCP with biliary manometry can thus assist in evaluation of a clinically obtuse problem, that of severe, right, upper-quadrant abdominal pain after gallbladder removal. Perhaps more importantly, endoscopic sphincterotomy has been shown to provide effective therapy for these patients. In a recent randomized, controlled trial published in the *New England Journal of Medicine*,<sup>5</sup> Greenen et al demonstrated that sphincterotomy provided dramatic pain relief for biliary dyskinesia.

Future advances on the horizon of biliary tract endoscopy include the use of endoscopic ultrasound for diagnosis and staging of tumors, laser lithotripsy of common bile duct stones, and the use of mini scopes to permit direct visualization of bile and pancreatic ducts. Over the next several years, these techniques should continue to expand rapidly developing capabilities for nonsurgical management of pancreaticobiliary disease.

### Oncogenes and Suppressor Genes in Gastrointestinal Cancer

The molecular basis of premalignant and cancerous gastrointestinal diseases is one of the most exciting areas of current gastroenterological research. As an example, key molecular events in the pathogenesis of colon cancer have been elucidated within the past two years. Proto-oncogenes are a group of evolutionary-conserved genes known to play a pivotal role in the regulation of cell growth and differentiation;<sup>6</sup> mutations in these genes are associated with deregulation of cell growth. In 1987, Bos et al and Forrester et al discovered a high incidence of mutations in *ras* family proto-oncogenes in cancers and precancerous polyps of the colon.<sup>7,8</sup> In the same year, the gene responsible for the hereditary syndrome of

**Figure 1.** A. Endoscopic cholangiogram showing a small stone (arrow) which has been pulled into the distal common bile duct by a balloon catheter (seen above the stone). Clips from a prior cholecystectomy are present. B. Post-sphincterotomy cholangiogram showing the duct free of stones.

familial adenomatous polyposis (FAP) was identified.<sup>9,10</sup> Unlike *ras* genes, the FAP gene is an example of a suppressor gene or anti-oncogene. Presence of the FAP gene on chromosome 5 provides an as yet uncharacterized regulatory factor essential for maintaining normal colon growth; when FAP is lost, a normal suppressive influence on epithelial cells is removed. This concept also appears to contribute significantly to the pathogenesis of sporadic colon cancer. In 1988, Vogelstein and coworkers showed that loss of portions of chromosomes 17 and 18 occurred in 75 percent of colon cancers as well as in a smaller proportion of precancerous colon polyps.<sup>11</sup> More recently, modification of the p53 gene on chromosome 17 was found in 75 percent of colon cancers.<sup>12</sup> As with the FAP gene, p53 functions as a suppressor gene; loss of both copies of the p53 gene appears to be a stimulus for colon carcinogenesis. However, loss of one copy by deletion of a piece of chromosome 17 and inactivation of the other gene copy by a point mutation can also produce an altered, defective gene product which fails to inhibit development of colon neoplasia.

Observation of mutations in *ras* genes in premalignant colonic polyps implied that such mutations might also occur in other premalignant gastrointestinal conditions such as ulcerative colitis and Barrett's esophagus. Both diseases are associated with an increased incidence of adenocarcinoma. Before tissue progresses to carcinoma, a dysplastic phase easily identifiable using conventional histologic-staining techniques is seen. The molecular basis for this predilection to develop cancer is currently unknown; activation of oncogenes by point mutations or deletion/inactivation of cancer suppressor genes are two plausible hypotheses. Figure 2 shows a point mutation in codon 13 of the K-*ras* gene in a patient with ulcerative colitis and dysplasia of the colon. Codon 13 is the same location at which *ras* mutations are known to occur in sporadic colon cancer. The incidence of *ras* mutations in a large cohort of patients with ulcerative colitis and Barrett's esophagus is currently being determined and correlated with the patients' clinical course. Additional studies are ongoing to ascertain whether deletions of genetic material seen in colon cancer and polyps also occur in dysplasia. Candidate areas of cancer suppressor activity on chromosomes can be directly assessed by inserting gene sequences from these chromosomes into cancerous cells; if the transfected genetic material has suppressor activity, cancerous cells should revert to cells with more benign histology and growth behavior. It appears that loss of anti-oncogenic deoxyribonucleic acid (DNA) may be as equally important as oncogene activation in creating an intracellular environment which supports development of gastrointestinal cancer.

## Epidermal Growth Factor and the Gastrointestinal Tract

Epidermal growth factor (EGF) is a single chain polypeptide originally isolated from the submandibular gland of the male mouse by Stanley Cohen;<sup>13</sup> this accomplishment resulted in the Nobel Prize in Medicine in 1986. It is a single chain polypeptide with fifty-three amino acid residues, and it is resistant to proteolysis by pepsin and trypsin. A primary biological effect of EGF is its ability to induce cellular proliferation of a variety of cells in a monolayer culture system -- epithelial cells lining the gastrointestinal tract being of particular interest to the gastroenterologist. In addition, EGF markedly inhibits gastric acid secretion and provides cytoprotection from gastroduodenal ulceration in animals.<sup>14</sup> These biochemical and biological observations are consistent with the significant impact of EGF on the pathophysiological process of peptic ulceration.

In humans, EGF activity has been reported in a variety of body fluids including plasma, urine, saliva, milk, cerebrospinal fluid (CSF), and pancreatobiliary secretions.<sup>15</sup> The precise locations of EGF synthesis are not well defined. Immunohistochemical-staining techniques have demonstrated the presence of EGF most prominently in Brunner's glands of the duodenum and in salivary glands.<sup>16</sup> EGF activity in human saliva has been postulated to play a major role in the maintenance of mucosal integrity in the upper gastrointestinal tract. The range of EGF activity in parotid saliva is 0.6 to 3.8 ng/ml (Table), and this concentration of EGF has been shown to cause proliferation of dermal fibroblasts in a monolayer cell culture system. Using

**Figure 2.** Direct sequencing of DNA polymerase chain reaction products amplified around K-*ras* codon 13. The lanes on the left (A) represent a microdissected dysplastic ulcerative colitis specimen; those on the right (B) were obtained from a leukemic DNA sample. The arrows indicate position 1 of K-*ras* codon 13; the brackets surround the three nucleotides of codon 13. In the noncoding strand, position 1 is the third or uppermost nucleotide of the codon (see arrows). The sample on the left contains two bands at position 1 of codon 13: one strong band in the "C" lane, one slightly weaker band in the "T" lane. The wild-type sequence of codon 13 is GCC. Thus, the signal in the "T" lane represents mutated DNA. The predominant normal signal is contributed by one normal allele of K-*ras* from the dysplastic tissue and two normal K-*ras* alleles from contaminating normal cells. The leukemic DNA sample on the right contains only the wild-type GCC sequence at codon 13.

this same *in vitro* monolayer culture of human dermal fibroblasts, effects of human saliva on tritiated thymidine uptake as a marker of cellular proliferation were assessed.<sup>17</sup> Similar to recombinant human EGF, human saliva stimulates cellular proliferation, and this proliferative effect of human saliva on dermal fibroblasts was specifically blocked by the addition of EGF antibody to the culture system. These observations support the hypothesis that EGF activity in human saliva may play a role in stimulating mucosal regeneration and maintaining the integrity of the upper alimentary tract.

This line of investigation was extended to studies of saliva secretion in cigarette smokers. Epidemiological studies clearly show that cigarette smoking is a major risk factor in the development, maintenance, and recurrence of peptic ulcer disease. Parotid saliva secretion as well as EGF output were markedly reduced ( $P < 0.05$ ) in cigarette smokers (Figure 3). Furthermore, immunoreactive EGF in saliva of smokers had no biological activity in five cases studied.<sup>18</sup> The underlying cause of this smoking-induced inhibition of EGF secretion and reduced EGF

bioactivity in saliva of smokers is under investigation. However, these interesting research observations provide a possible explanation for the well-known clinical observations of delayed healing and frequent recurrence of peptic ulcer disease in cigarette smokers.

Now is an exciting time in both clinical and investigative gastroenterology. Formerly observers of nature, new endoscopic equipment and research technology have provided gastroenterologists with tools to modify nature.

---

*Recent advances provide new options for long-term treatment of primary pulmonary hypertension, an illness which is usually fatal within three years of diagnosis.*

---

Since the first clinical description of primary pulmonary hypertension (PPH) in the early 1950s, the mechanism responsible for its development has eluded clarification. While PPH is rare, with probably fewer than 200 to 300 cases diagnosed yearly in the United States, it is a tragic illness which typically affects young people in the prime of their lives, and is usually fatal within three years from diagnosis. However, several recent advances in management have provided clinicians with new options for long-term treatment of this disease. This article reviews several of these new developments and attempts to clarify their role in the present day management of PPH.

## Anticoagulation

While most patients with PPH do not have thrombotic occlusion of the pulmonary vasculature, it has been known for many years that these patients are at risk for thromboembolism because of a dilated right heart, diminished pulmonary blood flow and venous stasis, and a sedentary lifestyle. Furthermore, patients with this disease tend to die suddenly, and thrombotic material is often found in the pulmonary vascular bed at postmortem. Given the presence of a compromised circulation as a result of the underlying disease, even a small thromboembolism may be sufficient to produce a precipitous decompensation of right heart function and death. However, many physicians who manage patients with pulmonary hypertension have been reluctant to prescribe anticoagulants since fatal hemothysis has been reported due to spontaneous rupture of atherosclerotic pulmonary vessels. Additionally, adjusting the degree of anticoagulation is difficult in patients prone to hepatic congestion due to right heart failure. Fuster and his colleagues<sup>1</sup> have recently reported that PPH patients treated with anticoagulants tended to have a longer survival than those who did not receive anticoagulant therapy. Thus, while anticoagulation may not affect the hemodynamic state in PPH, it appears that it reduces the chance of a potentially life-threatening complication. Our approach is to treat patients with

warfarin, adjusting the dose to achieve a prothrombin time of approximately fifteen to seventeen seconds; an adjusted dose of heparin may be a suitable alternative in patients at risk for major bleeding complications. Heparin has also been shown to inhibit the pulmonary vascular remodeling occurring in chronically hypoxic rats; this effect, which is independent of heparin's anticoagulant properties, may provide an additional, albeit theoretical, rationale for its use.

### Oral Vasodilator Therapy

The first descriptions of the hemodynamics of PPH also included the responses of the pulmonary vascular bed to the intravenous administration of vasodilator agents, initially acetylcholine and tolazoline. While there is no selective pulmonary vasodilator identified to date, several potent systemic vasodilator agents have been shown to reduce pulmonary artery pressure or pulmonary vascular resistance in some patients with PPH. Based on a large, prospective registry of this disease supported by the National Institutes of Health (NIH),<sup>2</sup> it appears that a majority of patients with PPH manifest at least an acute response to vasodilator agents that may be considered potentially beneficial. The calcium channel-blocking agents are the most widely used vasodilators in the treatment of PPH, and long-term hemodynamic and symptomatic improvement have been reported.<sup>3,4</sup> Recently, Rich and Brundage<sup>5</sup> reported substantial and sustained regression of right ventricular hypertrophy in patients with PPH treated with large doses of nifedipine or diltiazem. Our experience suggests that 25 to 35 percent of patients will exhibit this type of dramatic response, while approximately 40 to 50 percent of patients will manifest an increase in cardiac output and activity tolerance without a substantial fall in pulmonary artery pressure. Whether the latter type of response results in improved survival remains unknown at present.

### Prostacyclin

Prostacyclin (Prostaglandin I<sub>2</sub>, PGI<sub>2</sub>), a product of arachidonic acid synthesis produced by vascular endothelium, is a potent vasodilator and inhibitor of platelet aggregation. We have used prostacyclin acutely during cardiac catheterization to determine whether acute pulmonary vasoreactivity is present in patients with pulmonary vascular disease.<sup>6</sup> Since prostacyclin is potent, titratable, and short-acting (its half-life is approximately three to five minutes), it has proven safe and predictive of reversible pulmonary vasoconstriction. In general, patients with substantial acute responses to prostacyclin can be treated with orally active vasodilators, while patients with "fixed" disease should not be treated.

Recently, we demonstrated that patients with severe PPH refractory to conventional, oral-vasodilator therapy can be effectively treated with a continuous intravenous infusion of prostacyclin.<sup>7</sup> The medication is delivered by a portable infusion pump through a

permanently implanted central venous catheter; patients are taught to mix the drug and manage their central line at home, and have displayed significant improvements in pulmonary hemodynamics and exercise tolerance. This approach, while cumbersome, may be of particular use as a bridge to transplantation in patients with the severest forms of the disease.

### Transplantation

Combined heart-lung transplantation has been considered the surgical treatment of choice for end-stage pulmonary vascular disease. However, the critical shortage of donor organs often leads to a waiting period of twelve to eighteen months, and up to 40 percent of transplant candidates die before organs are found. In addition, rejection of one or both transplanted organs can occur and, bronchiolitis obliterans, a potentially life-threatening lung disease, has occurred in 25 to 40 percent of patients.

Single or double lung transplantation has recently proved successful in patients with severe emphysema and pulmonary fibrosis. This approach has now been successfully adapted to treat selected patients with PPH. Preliminary experience has suggested that single-lung transplantation results in a dramatic reduction in pulmonary hypertension and right ventricular dysfunction, and may be a suitable surgical approach for some patients with PPH. Because a single lung is more likely to be available than a heart-lung block, the average wait for lung transplantation is only three to four months at active centers.

### The Future

At the University of Maryland, we are developing a comprehensive diagnostic and management program for patients with pulmonary vascular disease using the multidisciplinary expertise of pulmonologists, infectious disease specialists, cardiologists, surgeons, and radiologists. We hope to develop a lung-transplant program with a particular emphasis on pulmonary vascular disease, and we are among a handful of centers in the country who serve as referral institutions for medical management of PPH. We will continue to work on new approaches to the noninvasive diagnosis of pulmonary hypertension, and participate in clinical trials of therapy for this disease. Finally, basic research focusing on clarifying the unique mechanisms responsible for pulmonary vascular reactivity will eventually translate into more effective strategies aimed at preventing or treating this disease.

## March is Music In Our Schools Month

March has been designated as Music In Our Schools Month by the Music Educators National Conference. During this time, children, teachers, parents, community leaders, and music lovers everywhere celebrate the importance of music. The theme for 1991 is "A World in Tune," which highlights the global impact of music and its universality to the human experience.

The centerpiece of the celebration is the World's Largest Concert, to be broadcast over PBS stations Thursday, March 7, from 1:00 to 1:30 p.m. The concert will originate from Walt Disney World's EPCOT Center and be hosted by Grammy Award winner, Marilyn McCoo. Organizers hope to break last year's record of more than eight million participants in this televised sing-along.

Med Chi's Music Medicine Clearinghouse Committee is arranging a viewing of the concert for interested members, staff, and friends. For further information, please contact Susan Harman, Clearinghouse Coordinator, at 301-539-0872.

## You Should Be Taking Care of Your Patients

# Hypertension in Blacks

---

Carolyn J. Hildreth MD and Elijah Saunders MD

---

*Dr. Hildreth is a general internist, and Dr. Saunders is Associate Professor of Medicine and Head of the Hypertension Division, Department of Medicine, University of Maryland School of Medicine, Baltimore. Reprints: Elijah Saunders MD, University of Maryland Professional Building, 419 West Redwood St., Suite 620, Baltimore, MD 21201.*

---

*The prevalence of hypertension is significantly higher among black Americans than white Americans, and hypertension control among blacks remains unacceptably poor.*

---

Although there are an estimated 60 million hypertensives in the United States, the number of black hypertensive Americans is disproportionately higher than their representation in the population as a whole. Hypertension appears earlier in black Americans than in white Americans, and is often not treated early enough or aggressively enough, resulting in a higher prevalence of more severe hypertension among black patients, frequently accompanied by target-organ damage. Furthermore, effective treatment of hypertension in this population is hampered by several major socioeconomic and psychosocial factors -- access to medical care, cost of treatment, and educational deficits which often affect compliance.

Although the treatment of hypertension is generally improving such that the morbidity and mortality from related disease are declining, this is not occurring at the same rate among black Americans as among white Americans. The reasons for this are not entirely clear.

## Incidence and Epidemiology

The first studies to demonstrate clear differences in blood pressure between blacks and whites in this country were reported in 1932.<sup>1</sup> Adams pointed out that mean systolic and diastolic blood pressures were higher in blacks at all ages. Since that time, practically every study done in the United States has shown higher incidence and prevalence rates among blacks. It seems that the statistically significant racial differences in blood pressure occur sometime after age seventeen, although some studies have found racial differences appearing in much younger children.<sup>2,3</sup>

The 1982 Maryland Statewide Household Survey of 6,425 adults ages eighteen and older showed a hypertension\* prevalence among blacks of 26.8 percent, compared with 20.1 percent for whites (Table 1).<sup>4</sup> (These figures are similar to the national estimates in the 1971-1974 Health and Nutrition Examination Survey.<sup>5</sup>) When the patient population was broken down into age groups (eighteen

---

\*Defined as systolic blood pressure  $\geq 160$  mm Hg or diastolic  $\geq 95$  mm Hg.

to forty-nine years, and fifty years and over), blacks had higher prevalence rates for all categories (Table 2),<sup>4</sup> and the rates of hypertension were higher in black females than in black males (Table 3).

The Hypertension Detection and Follow-up Program<sup>6</sup> found that not only was hypertension one and one-half to two times more common in black than in white Americans between the ages of thirty and sixty-nine, but severe hypertension (diastolic BP  $\geq 115$  mm Hg) was five times more common in black than in white men, and approximately seven times more common in black women than in their white counterparts. Other major studies have shown that the marked black-white differences in hypertension prevalence increase as individuals age.<sup>7</sup>

**Etiology and Pathophysiology of Hypertension in Blacks: Genetic Factors**

No one has yet determined any genetic differences between black and white hypertensive individuals; whether a single gene or several are involved in the

determination of blood pressure is unknown. However, familial aggregation of essential hypertension has been documented,<sup>7,8</sup> and Gillum pointed out that estimates of blood pressure heritability are statistically significant within black populations.<sup>9</sup> Unquestionably, both black and white hypertensives frequently give histories of elevated blood pressure in blood relatives. In fact, it is rare to encounter a hypertensive who does not know of family members with hypertension or with hypertension-related morbidity or mortality. However, it remains controversial whether genetic markers such as skin color are related to hypertension prevalence.<sup>10-12</sup>

Hormonal and physiologic differences may be associated with the ethnic disparity in the prevalence of hypertension. For example, Voors and colleagues<sup>13</sup> showed that in children between the ages of five and thirteen (63 percent white), the renin levels were higher in whites over all blood-pressure strata but were decreased in blacks. A number of investigators have reported plasma renin measurements in normotensive black and whites. Many determinations were done with renin stimulation, and most were done on ad lib sodium intake. In all of the studies, the renin levels were lower in blacks, with and without renin stimulation. This finding could be due to significant alterations of the blood supply to the juxtaglomerular apparatus and a disruption in the normal homeostatic response to renin release, to changes in plasma volume, and to renal blood flow. A second mechanism for the low-renin status in blacks could be primary volume expansion due to other intrarenal factors that promote sodium and water retention.

Other hormonal and physiologic aberrations found in black hypertensives may have some genetic basis. For example:

- Deficiency in the natriuretic vasodilatory renal kallikrein-kinin system has been postulated by Warren and O'Connor<sup>14</sup> to form the genetic basis for the pathophysiologic profiles found in many black hypertensives.
- Blacks tend to show lower values for some indices of sympathetic nervous dysfunction (e.g., lower levels of dopamine beta hydroxylase), and this seems to correlate with the diminished role of the sympathetic nervous system in the pathogenesis of hypertension in blacks.<sup>2,15</sup>
- Hemodynamic abnormalities found in many black hypertensives (especially the elderly) include a higher plasma volume. The kidneys of hypertensive blacks excrete significantly less sodium and potassium when the patient is challenged with a sodium load.<sup>16</sup>
- Cellular transport mechanisms recently have received considerable attention as potential mechanisms for development of hypertension.<sup>5</sup> Sodium-potassium cotransport and sodium-lithium countertransport have been found to be abnormal in black subjects with essential hypertension.<sup>17,18</sup> Numerous other transport systems

are currently under investigation, including circulating materials that may decrease the activity of sodium-potassium ATPase, thereby accounting for the volume-expanded form of hypertension frequently found in blacks. Conceivably, this might lead to a diminished capacity to extrude sodium (sodium-potassium pump) from smooth muscle cells, promoting an increase in intracellular calcium that, in turn, increases vasoactivity.<sup>19</sup>

- Ethnic differences in erythrocyte cation transport have been described. Woods and associates<sup>20</sup> reported a higher countertransport rate in blacks, a greater rate constant for passive lithium efflux, and a lower furosemide-sensitive efflux rate. Although whites exhibit a direct correlation between sodium lithium counter-transport and blood pressure, blacks do not. If these systems are operative in renal tubular cells or vascular smooth muscle, dysfunction in the erythrocytes may play a role in hypertension in blacks.

Blaustein and Hamlyn<sup>19</sup> have further explored this hypothesis and the role that calcium and magnesium may play, suggesting that the presence of a circulating hormone (natriuretic hormone) may facilitate the increased calcium in vascular smooth muscle cells, increasing tone and, therefore, hypertension.

- The frequency of hypertension in blacks may correlate with the increased sodium-potassium ratio found in the urine of many black hypertensives and could be related to the low dietary intake of potassium in blacks.<sup>21-24</sup> One may speculate that low potassium intake may be due either to economic factors (e.g., potassium-rich foods such as fresh fruits and vegetables may be less accessible) or to food preferences that exclude potassium-rich foods.
- Recent data linking insulin resistance to hypertension prevalence may have special applicability to the black population in which Type II diabetes and obesity (especially in black women) represent special problems. Studies by psychologists at Duke University<sup>25</sup> suggest that blacks may be more reactive to adrenergic alpha stimulation resulting in vasoconstriction and, therefore, a rise in blood pressure. Although these responses were elicited in the laboratory by cold pressor testing, the investigators suggested that such reactivity was comparable to chronic stressful lifestyles.

### Environmental Factors

Whereas most students of hypertension believe that genetic factors are necessary for the development of hypertension, there are also proponents of the environmental theory who suggest that an interaction of the environment with genetics is necessary for the development of hypertension. Proponents of the environmental theory stress that blacks are more frequently exposed to conditions of poverty, limited

education, low occupational status, and low socioeconomic stress. They propose that environmental factors can cause stress and induce transient blood-pressure elevation which, if repeated frequently, can lead to permanently elevated blood pressure.<sup>26</sup> It is further believed that eating habits (a taste for excessive salt, fat, and other nutritionally contraindicated foods) are adversely significant in blacks and are related to low socioeconomic and educational status.

### Detection, Treatment, and Control of Hypertension in Blacks

Although a decline in stroke and other cardiovascular morbid and mortal events has been occurring since the 1940s, the steeper decline since 1968 has been attributed to improved hypertension awareness, treatment, and control.<sup>27,28</sup> However, in spite of this encouraging trend from the population in general, surveys indicate that hypertension control among blacks remains unacceptably poor, particularly in view of the high prevalence.<sup>29</sup> According to Gillum and Gillum,<sup>30</sup> "High rates of noncompliance with follow-up and drug therapy, seriously compromise the effort of community-wide programs. Indeed, noncompliance with therapeutic or preventive health advice is now the major barrier to effective hypertension control in the United States." Impediments to ideal hypertension control in black communities can be divided into three categories:

1. Severity of hypertension in blacks.
2. Barriers related to the medical care system, including inadequate financial resources, inconveniently located health care facilities, long waiting times, and inaccessibility to health education, specifically as it relates to hypertension.
3. Barriers related to the social, psychosocial, and sociopolitical environment including problems of underemployment, unemployment, racism, and strained racial relationships.

### Treatment Considerations

In considering the treatment of a patient with hypertension, all aspects of that person's health care must be considered. Specifically, issues related to dietary preferences, levels of activity, and social habits including cigarette smoking and the use of alcohol will be relevant.

During the initial visit, it is possible to determine whether a diagnosis of hypertension is going to have an impact on an individual patient such that s(he) will be hampered in his or her ability to participate in the successful treatment of this problem.

Treatment for hypertension should begin with non-medicinal modalities. It is imperative for patients to learn to identify the foods they eat which are naturally high in sodium. They should be encouraged to learn to cook with other herbs and spices, such that salt naturally becomes a less frequent additive in cooking. It is also important to inform patients that the exces-

sive intake of alcohol can contribute significantly to uncontrolled hypertension.<sup>31</sup>

Patients should be informed of the risk of foods high in saturated fat and cholesterol, including many of the processed and pre-prepared foods (especially fast foods) that have become a frequent addition to the average person's diet, but particularly to that of the less affluent.

Next, issues related to activity should be addressed. These are particularly pertinent to those persons who are markedly overweight and for whom weight reduction may be expected to contribute to a decrease in blood pressure.

The issue of cigarette smoking must also be addressed. Cigarette smoking, although it has decreased nationwide, continues to decrease at a much lower rate among female patients and particularly among young less well-educated women, many of whom are black.<sup>32,33</sup>

Once lifestyle changes have been implemented, medicinal treatment may still be necessary. All patients should be classified as having either mild, moderate, or severe hypertension. As a general guideline for initiating treatment, the Joint National Committee's recommendations may be helpful for some patients with mild or moderate hypertension.<sup>34</sup> For black patients, consideration must be made as to which of the so-called step-one drugs should be chosen. According to the guidelines, a diuretic, beta adrenergic antagonist, calcium channel blocker, or angiotensin-converting enzyme inhibitor can be chosen. Many black patients respond less well to beta adrenergic antagonists unless a diuretic is added, than they do to certain calcium channel blockers used alone.<sup>35,36,37</sup>

In addition, a consideration must be made for the presence of left ventricular hypertrophy. While black patients have been classified as being low renin secretors<sup>5,13</sup> and, therefore, better responders to diuretic use, patients treated with a diuretic seem to have an increased prevalence of cardiovascular morbidity and mortality.<sup>38</sup> The assumption has been that the electrolyte imbalance and, particularly, the potassium and magnesium loss created by diuretics contribute to an increased susceptibility to cardiac arrhythmias.<sup>39</sup> Many black patients have been found to have left ventricular hypertrophy present at the time drug therapy is initiated.<sup>40,41</sup> Blacks have a high incidence of sudden cardiac death, presumably related to cardiac arrhythmias and possibly related to the high incidence of left ventricular hypertrophy that also contributes to the propensity toward these arrhythmias with or without electrolyte imbalance.<sup>42,43</sup> For this reason, the patient should be evaluated for the presence of left ventricular hypertrophy, which if present on the electrocardiogram, may be accepted as a definite clue to its existence; echocardiography is essential in questionable cases.

Non-potassium sparing diuretics as monotherapy should be avoided in patients with documented ventricular hypertrophy. The use of beta adrenergic antagonists is not totally excluded from the armamentarium in the black patient, particularly for those with mild hypertension who do not smoke<sup>44</sup> and who do not

have the additional risk of elevated serum cholesterol or of diabetes mellitus. Recent data showed that the response rate to monotherapy with beta blockers in black patients is between 57 percent and 58 percent, a level much better than previously thought.<sup>36</sup>

For those patients with moderately severe high blood pressure which is not being controlled with moderate doses of a single drug, the addition of a very low or low dose (12.5 mg or 25 mg) thiazide diuretic prior to moving on to another class of drugs may be helpful. Careful attention must be paid to the patient's electrolyte balance, particularly the potassium level. A potassium-sparing diuretic may be chosen in patients with adequate renal function who are not already receiving the potassium-sparing angiotensin-converting inhibitor class of antihypertensive drugs.

In considering the black patient with severe hypertension (diastolic blood pressure > 114 mm Hg), the basic strategy is reversed. It is usually necessary to initiate drug therapy at the first visit, and it is often prudent to start treatment with two drugs simultaneously, one frequently being a low dose diuretic. Many of these patients have significant renal impairment and will require use of the loop class of diuretics to control the volume-dependent component of their hypertension.

Many of the drugs in the stepped-care profile for initiating drug therapy have been tested in clinical trials for mild to moderate hypertension. In addition, the other classes of drugs including the alpha adrenergic agonists; vasodilators; or the combination alpha-beta adrenergic antagonist, labetalol, can be used. This latter drug has been shown to be quite efficacious in severe hypertension when given intravenously for hypertensive urgencies and when given orally for chronic control, particularly in black patients.<sup>45,46</sup>

For severe, refractory hypertension, minoxidil may be required but must be used along with a beta adrenergic antagonist and a loop diuretic to counter the reflex tachycardia and the sometimes profound fluid retention which can occur with this potent vasodilator. This drug can also be used in hypertensive urgencies but should always be initiated in very small doses. For outpatients, 2.5 mg or 5 mg per day can be the starting dose with close follow-up within one week. The dose can be slowly titrated upward until an adequate response is achieved or maximum dosage levels are reached. When considering use of this drug, the cosmetic side effect of hirsutism must be discussed with the patient.

An evaluation of possible secondary causes of hypertension can be based upon the basic laboratory values for electrolytes, particularly the serum potassium. This is important for patients who seem to be unresponsive to what should be adequate therapy. Of course, the noncompliant patient should always be excluded. (Although black patients have more hypertension, it should not be assumed that black patients *only* have essential hypertension.)

In summary, the strategy for treating black patients with hypertension is little different from that applied

to all patients. However, consideration must be given to the patient's lifestyle, the cultural differences in diet, and economic consideration.

# Enter the Eleventh Annual Med Chi Photo Contest

**Enter early!**

*Deadline for entries is April 19, 1991 ■  
Two categories: Black & White or Color ■  
Open to all Med Chi and Auxiliary Members*

■ *First and Second Prizes Awarded in Each Category* ■ *All Photographs will be displayed at the 1991 Annual Meeting at College Park.*

## *Med Chi Photo Contest Rules*

**Eligibility:** All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

### *Contest Rules:*

1. Photographs may be submitted in two categories: black and white or color.
2. Limit: three entries per person.
3. Prints only, no smaller than 8 X 10 or larger than 11 X 14, will be accepted. If your favorite shot is a slide, you must have a print made to enter in the contest within these size ranges.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name, address, and telephone number attached to the back of each photograph.
6. Entries may be mailed or brought to the Faculty Office, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on April 19.
7. Photographs entered in the contest will be on display at the Annual Meeting in May of 1991.
8. Prizes will be awarded to the first and second place winners. Additional information about the prizes will be published in the Journal.
9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, May 8-11, 1991.
10. Photographs will not be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual meeting at noon on May 11, or at the Faculty Building thereafter.
11. The Faculty does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

# The Spectrum of Treatment for Coronary Artery Disease: Medical Regression to High-risk Angioplasty

---

Robert A. Vogel MD

---

*Dr. Vogel is Head of the Cardiology Division and is the Herbert Berger Professor of Medicine at the University of Maryland School of Medicine, Baltimore. Reprints: Robert Vogel MD, Cardiology Division, University of Maryland Hospital, 22 South Greene St., Baltimore, MD 21201.*

---

*During the past decade, the Division of Cardiology at the University of Maryland has played an active role in regression of coronary artery disease through cholesterol-lowering and high-risk coronary angioplasty.*

---

No field of medicine utilizes a wider range of diagnostic and therapeutic methods than the management of coronary artery disease. Diagnostic tests include electrocardiography, echocardiography, nuclear scintigraphy, and coronary arteriography. Current therapies range from the management of the risk factors of hypertension, tobacco, and hypercholesterolemia to coronary angioplasty, bypass surgery, and cardiac transplantation. During the past decade, considerable clinical interest has developed in two areas at opposite ends of the spectrum: regression of coronary artery disease through cholesterol-lowering and high-risk coronary angioplasty. The Division of Cardiology at the University of Maryland has played an active role in both of these areas.

## Regression of Coronary Artery Disease

Having either felt the hardness of coronary atherosclerosis at the time of bypass surgery or studied its fibrotic and calcified appearance histologically, it is hard to imagine that any form of medical therapy could cause regression of clinically significant plaques. In contrast to these impressions, increasing numbers of studies are demonstrating that significant cholesterol reduction can cause regression of angiographically-documented coronary stenoses as severe as 75 percent diameter reduction. Indirect evidence comes from several clinical investigations. Epidemiological studies have found that coronary artery disease is only one-tenth as prevalent in Japan, where the mean serum cholesterol is 160 mg/dl, as it is in England and Finland where the mean cholesterol value is 250 mg/dl. In this country, coronary heart disease mortality is four times as likely in patients with cholesterol levels of 300 mg/dl as it is in patients with cholesterol levels of 200 mg/dl. Prospective randomized trials have shown that both the reduction of elevated low-density lipoprotein cholesterol and the elevation of reduced high-density lipoprotein cholesterol decrease the incidence of myocardial infarction, the need for bypass surgery, and heart disease mortality. These findings have led to a reassessment

of the upper limits for normal values, which are now 200 mg/dl for total cholesterol and 160 mg/dl for low-density lipoprotein (LDL) cholesterol. An even lower LDL value of 130 mg/dl is recommended for individuals with demonstrated coronary heart disease or multiple cardiac risk factors.

Despite its pathological appearance, it has been well-established that coronary atherosclerotic plaques are dynamic lesions which increase in severity in an irregular fashion. Plaque rupture and ensuing thrombosis leads to the acute coronary disease syndromes of unstable angina and myocardial infarction. Prior to recent studies, documented regression of coronary artery disease was rarely observed.

Early investigations of coronary disease regression utilized conservative medical management regimens which reduced total cholesterol to the 250 mg/dl to 300 mg/dl range. In such studies, angiographically-documented coronary disease regression was observed in only approximately 4 percent of patients.

Subsequent investigations utilized more aggressive means for lowering cholesterol, such as ileal bypass surgery, plasma apheresis, and the new HMG (hydroxyl-methyl-glutaryl) CoA (coenzyme A) reductase enzyme inhibitors. Investigators at the University of Minnesota have reported that cholesterol-lowering (420 mg/dl to 220 mg/dl) resulted in definite or probable regression of coronary disease in about 10 percent of patients. Cholesterol values have been reduced by more than 50 percent at Hammersmith Hospital using plasma apheresis exchange. Precise quantitative coronary arteriography has demonstrated that coronary lesions of up to 75 percent regress 20 to 30 percent within one year in patients treated with plasma apheresis. Unfortunately, little or no regression of very severe stenoses was found. Overall, 40 percent of patients undergoing plasma apheresis experienced coronary disease regression.

Maximal lipid-lowering of this extent can also be achieved using less expensive and less invasive approaches. Ornish and coworkers have reported reductions in total and low-density lipoprotein cholesterol of more than 50 percent using strict diet, smoking cessation, and exercise. At the end of one year, patients utilizing this lifestyle modification program had significant reductions in angiographic, coronary-artery-stenosis severity compared with controls. Additionally, coronary flow reserve, measured by positron emission tomography, improved in the treated group but worsened in the control group. Blankenhorn and coworkers have reported similar findings in patients undergoing coronary bypass surgery. Cholesterol-lowering from 240 mg/dl to 180 mg/dl resulted in an incidence of regression of coronary disease of 16 percent in medically treated patients versus 2 percent in controls. These data suggest that coronary disease regression can frequently be achieved in patients whose total cholesterol and LDL cholesterol are reduced below 150 mg/dl and 100 mg/dl, respectively.

The National Institutes of Health (NIH) has recent-

ly begun a multicenter trial of bypass patients whose mean cholesterol will be reduced to 80 mg/dl. Although no data are yet available from this study, considerable enthusiasm exists that maximal lipid reduction will play an important role in the maintenance of vein-graft patency. A similar study is currently underway at the University of Maryland; this nonrandomized trial utilizes combined cholestyramine and lovastatin therapy to achieve maximal lipid-lowering. Coronary-stenosis regression is being monitored by the Cardiology Division's internationally recognized quantitative arteriography laboratory at an interval of three years. This facility is the core angiographic laboratory for the National Heart, Lung and Blood Institute's Angioplasty Registry, and the Veterans Administration's Cooperative Trial of Angioplasty versus Medical Therapy. Precise, computerized, automated edge detection of coronary stenoses is used to provide objective assessment. Enrollment of patients with partly or totally uncorrectable coronary disease is currently underway. The University of Maryland's and NIH's regression studies are but two of the estimated twenty-five trials whose results will be reported in the next decade. The likely documentation of regression of coronary disease will make lipid reduction as important for those with demonstrated atherosclerosis as it has already become for asymptomatic individuals wishing to prevent it.

### **High-risk Angioplasty Using Cardiopulmonary Bypass**

Although first envisioned as a treatment for patients with single vessel disease and relatively normal left ventricular function, coronary angioplasty has been more recently used for those with advanced and acute coronary disease. These widening applications for coronary angioplasty have paralleled the technological developments of laser and atherectomy catheters, stents, and coronary and peripheral circulation support systems. The Division of Cardiology at the University of Maryland introduced the concept of prophylactic, total circulatory support for high-risk angioplasty in December 1987. To circumvent the potential problems of hemodynamic collapse during balloon occlusion or following vessel closure, the Division began to use a percutaneous cardiopulmonary bypass system which provides full, systemic, circulatory support initiated prior to angioplasty; this technique was termed "supported angioplasty." Supported angioplasty is performed in the catheterization laboratory using only local anesthesia by a team composed of two cardiologists, a cardiac anesthesiologist, and a perfusionist. Percutaneous 18-20F cannula insertion is performed using standard Seldinger technique. The portable heart-lung machine uses a centrifugal pump placed proximal to a membrane oxygenator. In this configuration, blood is actively aspirated through a multi-holed cannula positioned in the right atrium, through the pump and oxygenator,

and returned to the iliac artery. This system differs from operating room heart-lung machines in its direct connection of the pump to the afferent venous line, allowing operation using cannulas which can be placed percutaneously. In contrast to the intra-aortic balloon pump, this approach provides cardiopulmonary bypass of up to 5/min, independent of cardiac rate and output. Owing to the full circulatory support, this approach makes possible prolonged balloon inflations and dilatations of critical coronary vessels. Chest pain rarely occurs during balloon inflation, and its occurrence can usually be managed by increasing pump output. Following angioplasty, cardiopulmonary bypass is tapered off and cannulas are removed using either surgical closure or percutaneous removal. The latter is accomplished using a mechanical groin clamp starting approximately five hours after termination of the procedure. Patients suffering acute vessel closure can be taken to the operating room hemodynamically stable.

Shortly after introducing this new procedure, the Division of Cardiology formed a National Registry of what is now twenty-one centers performing elective supported angioplasty to tabulate initial experiences with high-risk patients. During 1988, 105 patients (mean age: sixty-two years) with indications of severe or unstable chest pain, at least one dilatable stenosis, and ejection fractions less than 25 percent or target vessels supplying greater than half the remaining viable myocardium, underwent supported angioplasty. This group included twenty patients whose disease was deemed too severe to undergo bypass surgery and thirty patients who had dilatation of their only patent coronary vessel. Seventeen patients had left main coronary stenosis, fifteen of whom underwent dilatation of that vessel.

A high angioplasty success rate (95 percent) was achieved for the group that underwent an average of 1.7 dilatations per patient. Symptomatic improvement, defined as lessening of New York Heart Association (NYHA) chest pain classification of at least two classes, was reported by 91 percent of the patients. The overall hospital mortality of 7.6 percent was almost exclusively due to poor outcomes in patients older than seventy-five years with left main coronary artery stenosis. The remaining seventy-six patients had a hospital mortality of 2.6 percent. In the three specific subgroups considered at highest risk -- those with dilatation of their only patent coronary vessel, those deemed inoperable using bypass surgery, and those with ejection fractions less than 25 percent -- hospital mortality ranged from 0 to 7 percent. These findings suggest that supported angioplasty can be performed in high-risk patients other than elderly individuals with left main coronary artery stenosis with the expectation of excellent symptomatic improvement and short-term survival.

The initial National Registry data, however, did not fully define the specific subgroups requiring full circulatory support. The Division of Cardiology at the

University of Maryland is currently utilizing standby cardiopulmonary support in a fashion allowing rapid initiation of cardiopulmonary bypass in patients developing hemodynamic instability. This approach, termed "standby supported angioplasty," has been used recently in many patients previously provided with prophylactic support. Emergency initiation of support in the standby situation has been required in a minority of incidences to date, but has been performed successfully even during cardiac arrest. At the present time, prophylactic support is being utilized only for patients undergoing dilatation of their only patent coronary vessel or for those who develop hemodynamic instability during coronary artery intervention.

In addition to percutaneous femoral artery bypass, other approaches to supporting the systemic and coronary circulations during high-risk angioplasty are currently under development. Approaches providing systemic perfusion include the transaortic valve turbine pump (hemopump), and the percutaneous left ventricular assist provided through transseptal access to the left atrium. Neither of these systemic support approaches, however, provide direct myocardial perfusion during balloon inflation. Examples of those that do include the autoperfusion balloon catheter, antegrade pump perfusion using either blood or fluosol, and retrograde coronary sinus perfusion. The Division of Cardiology currently has a unique system under development which allows near full left ventricular bypass support to be performed using a single double-lumen catheter placed retrograde across the aortic valve. Unlike cardiopulmonary bypass, this approach can provide prolonged support of the systemic circulation. Concepts of supported and standby supported angioplasty, and associated evolving technologies now permit balloon and other interventional procedures to be safely accomplished in even the most high-risk individuals.

Clearly, the accelerating progress of heart disease research suggests that we will soon be able to both prevent much of coronary heart disease as well as to manage effectively those who suffer from its most advanced forms. ■

### **The perfect setting for parties or parliamentary procedures.**

*Located across the street from the Meyerhoff and a block from the Lyric, Med Chi has a space to accomodate your next social or business group gathering.*

# PRELIMINARY SCHEDULE

## American Medicine Today: Perspectives from Maryland

May 1991

**8**

Wednesday

Registration  
General Business Session  
Council Meeting  
House of Delegates Meeting  
General Membership Meeting  
**Keynote Presentation** - John Tupper, M.D., President AMA  
Auxiliary Luncheons/Business Meeting  
Plenary Session - Guest Speaker  
**Scientific Sessions** sponsored by:  
Maryland Vascular Institute  
Exhibitors' Sweepstakes Drawing/Exhibitors' Reception (casual attire)  
Evening Entertainment

**9**

Thursday

Prayer Breakfast  
**Scientific Sessions** sponsored by:  
American Heart Association, Maryland Affiliate, Inc.  
Med Chi Long-term Care & Geriatrics Committee and the Alzheimers Association of Central Maryland  
Med Chi and the Department of Family Medicine, University of Maryland  
Maryland Society of Eye Physicians and Surgeons  
Maryland Asthma and Allergy Society  
Med Chi Committee on Professional Ethics  
Maryland Commission on High Blood Pressure & Related Cardiovascular Risk Factors  
Med Chi Music Medicine Clearinghouse Committee  
Med Chi Committee on Physician Rehabilitation  
Maryland Society of Anesthesiology  
**Keynote Presentation** - Senator John D. Rockefeller IV of West Virginia  
Exhibitors' Sweepstakes Drawing  
Auxiliary Business Meeting/AMA-ERF Auction/Luncheon  
Plenary Session - Guest Speaker  
Reception - Dinner Optional

**10**

Friday

General Breakfast Session  
**Keynote Presentation**  
**Scientific Sessions** sponsored by:  
Medical Mutual Liability Insurance of Maryland  
Maryland Dermatological Society  
Maryland Society for the Rheumatic Diseases and the Maryland Arthritis Foundation  
Maryland Psychiatric Society, Inc.  
Maryland Academy of Family Physicians and Maryland AIDS Professional Education Center  
Exhibitors' Sweepstakes Drawing  
Plenary Session - Guest Speaker  
Closing Business Session  
Annual Presidential Banquet honoring Reynaldo L. Lee-Llacer, M.D. (Reservation required - Black Tie optional)

**11**

Saturday

Events to be announced.

Complimentary refreshments will be available throughout each day. In addition, a box lunch will be provided in the exhibit halls. **This Preliminary Schedule is subject to change.**

## Auxiliary

### Maryland Wins Again at Southern Medical

As Vice Councilor for the Southern Medical Association Auxiliary (SMAA), it was my responsibility to prepare an exhibit on *Medical Heritage* for the Annual Convention in Nashville. Janet Campbell, the 1989-1990 president of SMAA, suggested that an auxiliary member prepare an exhibit on Walter Edward Dandy MD, her doctor from her hometown of Sedalia, Missouri. Since he was a world-renowned physician from Hopkins, it seemed to be a perfect project for Maryland, and with the assistance of two willing auxiliary members, the research was begun.

Walter Edward Dandy was born in Sedalia, Missouri in 1881. His early years were spent in Sedalia, after which he attended the University of Missouri where he excelled academically. He consulted with Sir William Osler about the prospect of studying at Oxford University; Dr. Osler advised him to finish his medical studies at Johns Hopkins. He graduated from Johns Hopkins Medical School in 1910.

In 1918, at the age of thirty-two, Dr. Dandy used ventriculography on twenty children with hydrocephalus. This study started him on the road to medical fame. Dr. Dandy ultimately became a major figure in the Golden Age of Surgery at Hopkins. In addition to being a neurosurgical genius, he was a highly revered teacher and writer. He wrote five books between 1933 and 1945 but felt his crowning work was *Surgery of the Brain*, a monograph of 600 pages which is currently in Lewis' *Practice of Surgery*.

Dr. Dandy inspired his residents to be superb technicians, as well as servants to their patients. While his residents were in constant fear of him, they were also devoted to him. Being a great baseball fan, he took his interns and residents to see the Baltimore Orioles once a year. (It is rumored that his "guests" received hot dogs according to rank -- the residents were each given two, but the interns only one.)

After learning that a player was injured by a pitched ball, Dr. Dandy began working on the idea of a protective batting cap. His design was eventually patented on November 9, 1943, and was produced by A. G. Spaulding and Bros. One of Dr. Dandy's protective caps is now on exhibit at the Baseball Hall of Fame in Cooperstown, New York.

When researching this project, we had the opportunity to meet with Mrs. Sadie Dandy, widow of Dr. Walter E. Dandy. She graciously told us about her life with Dr. Dandy and their family, and showed us memorabilia of his career and travels. The medical tradition continues in the family through Walter Edward Dandy, Jr. MD. We also had the good fortune to meet Walter Edward Dandy, IV, age six weeks. His father loaned us a copy of the patent for the protective baseball cap which became part of our exhibit. (We look forward to our next meeting with Mrs. Dandy on the occasion of her ninetieth birthday.)

This interesting research, coupled with meeting Mrs. Dandy, resulted in an exhibit that won for Maryland, the Second Best State Medical Heritage Award.

CHING BARRETTO with MILDRED TAYLOR and BETTYMOLZ

JOSIE FIGUEROA, President

Auxiliary to the Medical and Chirurgical Faculty of Maryland ■

Serving on the Southern Medical Association Auxiliary Board from Maryland are Mildred Taylor, Northern Regional Vice President and Doctors' Day Postal Plate Chairperson; Mary Skipton, Councilor; and Ching Barretto, Vice Councilor.

### Tips about Handling Insulin

*Doctor: I read a Letter to the Editor in Diabetes Forecast recently in which the mother of a diabetic child carried insulin in an insulated bag along with Dry Ice when traveling. Is such a precaution necessary to preserve the potency of insulin? How should I handle insulin when traveling?*

All preparations of insulin are required by law to bear the instruction: "Keep in a cold place--avoid freezing." This is a requirement of the Food and Drug Administration (FDA) concerning the storage of insulin. For this reason, the recommendations concerning proper storage, and the time that the patient has the vial in use (expiration date) are separated. Each of the single insulins, such as Regular, NPH, Semilente®, Lente®, Ultralente®, and Protamine Zinc are stable up to two years at room temperature (70 to 77 degrees F.).

Modification of the legend would not increase the sale of insulin so the pharmaceutical industry has no interest in applying to the FDA for a change. The FDA does nothing unless someone requests that it be done. So, the labeling remains the same decade after decade. If there is a profitable market for the gadgets, one cannot blame a manufacturer for producing insulated bags and other items unnecessary for the management of diabetes.

Experienced diabetic patients have known for years how to lessen the expense and inconvenience of managing diabetes. A vial of U-100 insulin contains 1000 units and usually has an expiration date of eighteen months or more from the date of purchase. If a patient takes thirty units in the a.m. and twenty units in the p.m., for a total daily dose of fifty units, a vial would last twenty days assuming there is no loss in the syringe. If it is more economical to buy in ten-vial packages, this patient could do so safely (a seven-month supply).

Insulin vials should be stored on the open shelf of a refrigerator (45 to 50 degrees F.). When a new vial is placed in use, it can be kept in the medicine cabinet, on a kitchen shelf, or wherever it is convenient, until all of the contents are consumed. Most hospitals no longer

require that insulin dispensed for hospital patients be kept under refrigeration. Injected insulin at room temperature produces less discomfort than cold insulin.

If a patient plans to go away for a few days, the vial can be placed in a coat pocket, a purse, or an attaché case and kept with the other insulin supplies. There is no danger of damage to the insulin as long as it is not placed in a location which might get very hot or very cold, such as the trunk of a car. Insulin should not be checked in with airplane luggage because the exposure is uncertain and sometimes luggage is lost or delayed in transit. There is no need to purchase an insulated container to carry insulin, and certainly no need for Dry Ice. If insulin were to be placed in contact with Dry Ice, the contents might be frozen and damaged as far as useability and potency are concerned. If a trip takes several months, a patient could carry all of the insulin and supplies in this manner. However, if household refrigeration is available en route, it should be utilized.

All vials of insulin should be checked for a long expiration date at the time of purchase and examined for evidence of particles adhering to the walls of the vials. If particles are noted adhering to the wall of a vial, it should be called to the attention of the dispensing clerk or pharmacist and exchanged for another vial. The most common grossly identifiable finding in previously frozen or damaged insulin is the adherence of particles to the wall of the vial.

Before withdrawal of cloudy insulin (NPH, Lente®, Protamine Zinc, etc.), the vial should be rotated well to insure even distribution of the particles in the suspension. Shaking a vial of insulin will cause suds or foam to develop, and the particle distribution in the fluid will be uneven. Should it occur, the vial can be set aside for a while and the foam will gradually disappear. Lastly, patients should be advised never to change types, concentration, or manufacturers of insulin without first discussing it with their physician.

### A CLINICAL MOMENT WITH...

Physicians in all specialties are invited to submit synopses of current clinical problems in a question and answer format.

Write: **A Clinical Moment With...**

*Maryland Medical Journal*

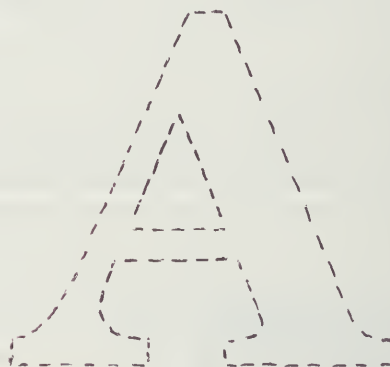

**1211 Cathedral Street**

**Baltimore, MD 21201-5585**

## If these are your Questions:

What is meant by impairment?  
When considering self-disclosure,  
what issues should be taken into account?  
How will others react to my  
self-disclosure?  
Should I tell my colleagues?  
What should I tell my patients?  
What should I say on applications for  
privileges, licensing, etc.?

## The Physician Rehabilitation Committee Has the Answers

For a free copy of "To Disclose or Not to Disclose," a brochure of questions and answers on the topic of self-disclosure for the physician recovering from impairment or illness, published by the Physician Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland as a service to all Maryland physicians, members and non-members, write to Med Chi, Physician Rehabilitation Committee, 1211 Cathedral Street, Baltimore, MD 21201 or call (301) 539-0872 or in MD 800-492-1056.

Mary Betty Stevens MD, Chairperson of the Medical Advisory Board of the Maryland Lupus Foundation, recently received the 1990 Baltimore City Medical Society (BCMS) Community Service Award. This award is presented annually to a member of the Society in recognition of outstanding community service. Dr. Stevens was nominated by the Maryland Lupus Foundation for her contributions in founding the organization and serving as chairperson of its medical advisory board since 1983. Through her dedication, the organization has grown to 2,000 members supporting over 4,900 lupus patients, and their family and friends.

In presenting the award, Dr. Susan Guarnieri, President of BCMS, stated, "Dr. Stevens serves as an example to us all of the blend of research, clinical practice, and community service that exemplifies the goals of the medical profession."

A 1960 graduate of Johns Hopkins, she is currently Professor of Medicine in the Johns Hopkins University Medical School, and Director of the Division of Rheumatology, Good Samaritan Hospital. Dr. Stevens is a Fellow of the American College of Physicians; a member of four medical journal editorial boards; and a consultant to the Social Security Administration, the Maryland State Commission on Arthritis and Related Diseases, the Rheumatology Division Program in Mount Sinai, NY, and the Residency Review Committee for Internal Medicine.

In addition to having written or contributed to hundreds of scientific articles and book chapters, she has received several awards for her ability in clinical teaching.

Keith Falcao MD

Keith Falcao MD has been appointed Chief of the Section of Endoscopic Surgery at St. Agnes Hospital; this is a new section within the hospital's Department of Surgery. As Chief, Dr. Falcao recently announced a revolutionary treatment for gallbladder disease, laparoscopic cholecystectomy, which has been implemented at St. Agnes.

Dr. Falcao received his undergraduate and doctor of medicine degrees from Dow Medical College in Pakistan. He served a rotating internship in Toronto, Canada; a general surgery residency at New York Medical College in New York, NY; and completed his surgical residency at St. Agnes Hospital. He is certified by the American Board of Surgeons and is a Fellow of the American College of Surgeons.

### When it's time to send in The Special Team.

Here at PSA Financial Center, we utilize a team approach to financial problem solving, and we put together special teams as they are required to deal with special situations.

PSA Professional Liability, Inc., for example, specializes in Medical Malpractice Insurance. Our associates can call upon both in-house staff and outside specialists for their expertise when needed. And because our clients have confidence in our special teams, PSA Professional Liability is now among the largest Malpractice Insurance Agencies in Maryland.

Contact any of our affiliates to enjoy the satisfaction that comes from having a team of financial service specialists working for you.

## LETTERS TO THE EDITOR LETTERS TO

I would like to commend the *Journal* for publishing the excellent article on venomous snakebites by Drs. Gold and Barish in the September 1990 issue. It was of great help to me in preparing my column on the subject for the November 20, 1990 issue of the *Baltimore Sun*. My thanks to the *Journal* and the authors.

SIMEON MARGOLIS MD

The Johns Hopkins University School of Medicine  
Baltimore

# *The Dual Diagnosis Treatment Program of Sheppard Pratt*

Patients with psychiatric illness and drug or alcohol problems present complex diagnostic and treatment challenges.

Sheppard Pratt's inpatient units are designed and staffed specifically for the treatment of these complicated patients.

We provide:

- ☐ Comprehensive psychiatric and chemical dependence evaluation;
- ☐ Specialized programs for patients with affective disorders, anxiety disorders, schizophrenia and learning disorders;
- ☐ Psychopharmacological evaluation and treatment;
- ☐ Specialized programming for the gerontological patient who is chemically dependent;
- ☐ Addiction education for the psychiatric patient who is resistant to treatment for chemical dependence; and
- ☐ On site Double Trouble, AA and NA meetings.

Founded in 1853, Sheppard Pratt is a 322-bed private, not-for-profit psychiatric hospital that provides comprehensive diagnostic and treatment services for short, intermediate or long term patients as well as outpatient and partial hospitalization care.

For more information about Sheppard Pratt's approach to the dually diagnosed patient, or to make a referral, contact the Adult Admissions Office at:

(301) 938-3800  
6501 North Charles Street  
Baltimore, Maryland 21285-5815

▪ *Sheppard Pratt*  
A not-for-profit health system

# Where there's smoke...there may be bronchitis

"Recent research has delineated early, more subtle changes in lung and immune functions. These alterations directly predispose smokers to respiratory tract infection."

*Am Fam Phys* 1987;36:133-140

**Ceclor<sup>®</sup>**  
cefactor  
Pivules<sup>®</sup>  
250 mg

**Established therapy  
for today's patients**

For respiratory tract infections due to susceptible strains of indicated organisms

#### Brief Summary.

Consult the package literature for prescribing information. Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A  $\beta$ -hemolytic streptococci).

Contraindication: Known allergy to cephalosporins.

Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

#### Precautions:

- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of non-susceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

#### Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon.

Those reported include:

- Hypersensitivity reactions have been reported in about 1.5% of patients and include morbilliform eruptions (1 in 100). Pruritus, urticaria, and positive Coombs' tests each occur in less than 1 in 200 patients. Cases of serum-sickness-like reactions have been reported with the use of Ceclor. These are characterized by findings of erythema multiforme, rashes, and other skin manifestations accompanied by arthritis/arthralgia, with or without fever, and differ from classic serum sickness in that there is infrequently associated lymphadenopathy and proteinuria, no circulating immune complexes, and no evidence to date of sequelae of the reaction. While further investigation is ongoing, serum-sickness-like reactions appear to be due to hypersensitivity and more often occur during or following a second (or subsequent) course of therapy with Ceclor. Such reactions have been reported more frequently in children than in adults with an overall occurrence ranging from 1 in 200 (0.5%) in one focused trial to 2 in 8,346 (0.024%) in overall clinical trials (with an incidence in children in clinical trials of 0.055%) to 1 in 38,000 (0.003%) in spontaneous event reports. Signs and symptoms usually occur a few days after initiation of therapy and subside within a few days after cessation of therapy; occasionally these reactions have resulted in hospitalization, usually of short duration (median hospitalization = two to three days, based on postmarketing surveillance studies). In those requiring hospitalization, the symptoms have ranged from mild to severe at the time of admission with more of the severe reactions occurring in children. Antihistamines and glucocorticoids appear to enhance resolution of the signs and symptoms. No serious sequelae have been reported.
- Stevens-Johnson syndrome, toxic epidermal necrolysis,

and anaphylaxis have been reported rarely. Anaphylaxis may be more common in patients with a history of penicillin allergy.

- Gastrointestinal (mostly diarrhea): 2.5%
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonía, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1% and, rarely, thrombocytopenia and reversible interstitial nephritis.

Abnormalities in laboratory results of uncertain etiology:

- Slight elevations in hepatic enzymes.
- Transient lymphocytosis, leukopenia, and, rarely, hemolytic anemia and reversible neutropenia.
- Rare reports of increased prothrombin time with or without clinical bleeding in patients receiving Ceclor and Coumadin concomitantly.
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest<sup>®</sup> tablets but not with Tes-Tape<sup>®</sup> (glucose enzymatic test strip, Lilly).

### Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

#### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degrees, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles.

Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both the principal author and **MMJ**.

\* \* \*

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

## HARD NEWS: Issues & Answers in Medical Reporting

AMA's Eleventh Annual Health Reporting Conference  
Washington, D.C. • April 18-21, 1991

If you are a medical communicator wishing to sharpen your skills, plan to attend the AMA's Eleventh Annual Health Reporting Conference, Thursday, April 18 through Sunday, April 21, 1991 in Washington, D.C.

This is a unique conference designed for medical reporters, physician broadcasters and medical spokespeople. The conference features a combination of skills development courses in broadcast writing, interviewing, editing and production, plus opportunities to have your tapes critiqued by experts. Network with the pros and learn valuable tips on breaking into the business, developing the skills and dealing with the issues confronting medical broadcasters today.

Faculty includes experienced physician broadcasters, network producers, broadcast consultants, writers, editors, producers and professional speakers trainers.

	Until February 15, 1991	February 16 and beyond*
<b>Fees:</b>		
AMA Member	\$650	\$715
Non-Member	\$825	\$900
Students/Residents	\$250	\$275
Optional Day	\$275	(not available after 2/15 cut-off)
Individual Coaching Sessions	\$ 60	\$ 75

Course tracks are offered in Speakers Training, and Broadcasting (Introductory, Intermediate and Advanced). Electives are open to all participants. Complete registration information is available by calling 312/464-5102.

Fee includes Welcome Reception, April 18, 6:30 p.m., continental breakfasts, luncheons, video and audiotapes, workshops and materials. Please make check payable to the American Medical Association. We will confirm your registration by mail.

\*Registration will be accepted only on a space available basis after the February 15, 1991 cut-off date.

Register by phone or mail. Please register by February 15, 1991. This conference offers small classes, and the AMA cannot guarantee appropriate level placement after the registration cut-off date. To register, complete and return this form and mail in an envelope with your registration fee to:

Against Drugs

# YOCON<sup>®</sup>

## YOHIMBINE HCl

**Description:** Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

**Action:** Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it, however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

**Indications:** Yocon<sup>®</sup> is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

**Contraindications:** Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

**Warning:** Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

**Adverse Reactions:** Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.<sup>1,2</sup> Also dizziness, headache, skin flushing reported when used orally.<sup>1,3</sup>

**Dosage and Administration:** Experimental dosage reported in treatment of erectile impotence.<sup>1,3,4</sup> 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.<sup>3</sup>

**How Supplied:** Oral tablets of Yocon<sup>®</sup> 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

## The choices you make now may make all the difference later.

The decisions you make in a crisis will have a lasting impact on your patient's health. In the same way, the medical malpractice insurer you choose now may make all the difference to your professional and financial well-being in the years ahead.

When you choose Princeton, you're choosing a company with a solid track record. A company with years of experience providing professional liability insurance for physicians, and a history of successfully defending policyholders against meritless claims.

You're also choosing a company that's flexible enough to design policies that meet your individual coverage needs. Our innovative

*Occurrence Plus* policy, for example, combines the best features of standard occurrence and claims-made and offers you the broadest insurance protection available.

And coverage is only half the story. Princeton has seasoned specialists working on your behalf -- so service is prompt and professional. Plus, our team of risk management consultants is ready to answer your questions, or arrange on-site educational programs.

Whether it's your patient's future, or your own, that's on the line, making the right choices is critical. Choose the insurer that offers experience, flexibility and service. Choose Princeton. Call your independent insurance agent today.

## It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

In Bethesda And Potomac, Maryland

# One Choice Is Obvious

Anyone can build a large home in Potomac or Bethesda. But if you're willing to pay the price for luxury and convenience, you should also be getting a lot more for your money than just size and location. You should be getting a home that justifies its price down to every last detail. With noteworthy design.

Superior and innovative energy conservation techniques. Craftsmanship. And exceptional quality control.

Exactly the things our industry and peers have considered when, for over a decade, they've consistently honored Mitchell & Best with local, regional and national awards in all four categories.

And that's important to know. Because it means you'll always be able to choose the very finest home. A home that's more than just impressive to look at... a home that is a certified winner in every way. And not just because we say so.

## Grand Opening... EAGLE RIDGE

Our newest, largest luxury homes. In the woods... in Avenel.

## **Making the right choices means asking the right questions.**

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which

questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

## Case #14

43 year old female with left-sided paresthesias and history of a "stroke" 23 years ago.  
**DIAGNOSIS: ARTERIO-VENOUS MALFORMATION (AVM) of the right side of the cerebellum.**

AVMs are the most common vascular abnormality affecting the brain; 95% are supratentorial. The classic tangle of dilated arteries and veins is usually associated with rapid flow and A-V shunting. This is manifested by a "flow void" absence of signal, making the AVM easily imaged by MRI. The appearance can be complicated by the presence of acute or chronic hemorrhage and partial thrombosis or slow flow. Magnetic Resonance Angiography (MRA) and Gadolinium enhancement may both be helpful in evaluation of the AVM.

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and week-end hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

**You work hard to gain your patients' trust and confidence. At Drs. Copeland, Hyman & Shackman, we'll help you keep it.**

# A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

# ***The Personality Disorder Treatment Program of Sheppard Pratt Hospital***

Very often, specialized inpatient evaluation and treatment is a critical step in the effective care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Short-term and intermediate-term specialized inpatient treatment
- ☐ Extended-term intensive inpatient treatment
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychotherapy and psychopharmacology consultation
- ☐ Intensive individual and group psychotherapy provided by our staff of psychiatrists and psychologists
- ☐ Long-term treatment planning

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

(301) 938-3800  
6501 North Charles Street  
Baltimore, Maryland 21285-5815

▪ *Sheppard Pratt*  
A not-for-profit health system

Ann Sires is blessed with an earthy wisdom that allows her to accept what is. But deep inside also burns a fiery determination never to give into it.

Four years ago, Ann learned she had colon cancer. And about six months to live. She began a battle for life that would take her through eleven surgeries. Then two-and-a-half years ago, to an indispensable ally.

While in the hospital, her physician, Dr. James Congdon, introduced Ann to Caremark Homecare. Through a regimen of Total Parenteral Nutrition and chemotherapy, Caremark has helped Ann fight her cancer to a draw.

Yet, she realizes that this battle may never be fully won. Which is perhaps why Ann's greatest comfort comes from life's simple pleasures. A 12-year-old boy to bring up right. Five hundred bulbs in the ground waiting for spring. And the folks in Carnation, Washington who say you haven't lived until you've tasted Annie's Double Mint Apple Jelly.

Caremark Homecare. Because life should be worth living.<sup>SM</sup>

**CAREMARK**

Allan David Jensen MD

*Allan D. Jensen MD*, Assistant Professor of Ophthalmology at the Johns Hopkins Wilmer Eye Institute, was recently elected Chairperson of the Council of the American Academy of Ophthalmology (AAO), a policy-making body for more than 16,000 ophthalmologists. Dr. Jensen is also Chairperson of AAO's Council and the Federal Economic Policy Committee, and serves on

the AAO Board of Directors.

A graduate of Johns Hopkins University, he is Chief of Ophthalmology at Union Memorial Hospital, and Staff Ophthalmologist at Johns Hopkins Hospital and the Greater Baltimore Medical Center. A Diplomate of the National Board of Medical Examiners and the American Board of Ophthalmology, he is an active member of thirteen different professional societies.

In addition to his positions with the AAO, Dr. Jensen is currently serving as a member of the Board of Directors of the Maryland Society of Eye Physicians and Surgeons, is Vice President of the Baltimore City Medical Society, is Councillor from Baltimore for the Medical and Chirurgical Faculty of Maryland, is a member of the Medical Advisory Board of the Maryland Foundation for Health Care, is a consultant for the Criteria Review Panel of the Delmarva Foundation for Health Care, and is Treasurer of the Baltimore City Medical Society Political Action Committee (PAC).

*Jerome P. Reichmister MD* was recently appointed Orthopedist-in-Chief at Sinai Hospital of Baltimore. President of the Sinai Hospital Medical Staff since 1989, Dr. Reichmister has also served on Sinai's Operating Room Committee, Medical Executive Committee, and as Chairperson of the Orthopedics Committee.

An attending surgeon at Sinai Hospital for twenty-one years, he is Director of Orthopedic Education, holds a faculty position as Clinical Associate Professor of Orthopedic Surgery at the University of Maryland Medical School, and is Clinical Instructor of Orthopedic Surgery at the Johns Hopkins University School of Medicine; his love of teaching earned him Sinai's Golden Apple Award in 1974.

Robert Hennessy MD

*Robert G. Hennessy MD*, Chief of the Neurological Surgery Section at St. Agnes Hospital, recently assumed the post of President of the Medical Staff. Dr. Hennessy received his undergraduate degree from Holy Cross College in Worcester, MA and his medical degree from Georgetown University in Washington, DC. He is certified by the Board of Neurological Surgery, is a Fel-

low of the American College of Surgeons, and is a Diplomate of the National Board of Medical Examiners. Dr. Hennessy is also an active member of a number of professional societies in addition to Med Chi, including the American Association of Neurological Surgeons, the Congress of Neurological Surgery, and the Neurological Society of the Virginias, for which he is president-elect.

Carol Parnes MD

*Carol Parnes MD* was recently installed as the President of the Professional Staff of the Howard County General Hospital (HCGH); she is the first woman and the first pediatrician to be elected to this top leadership position. A graduate of Barnard College and the Albert Einstein College of Medicine, she completed her residency and training at Montefiore Hospital in New York.

In addition to managing a busy Columbia practice, she has been extensively involved in the hospital, including membership on the Credentials Committee, Medical Executive Committee, Finance Committee, Ethics Committee, and the Dinner Dance Committee which coordinates a major annual fund-raiser sponsored by HCGH physicians.

# Talk to us. (If you talk enough the dictation equipment is free!)

- Solves staffing, space and reliability problems.
- 3600 lines a day qualifies for free equipment.
- Fast turn-around, including 3-hour STAT service.
- Printout in your office, instant revisions.

If your practice generates 3600 lines a day or more, you qualify for a complete digital dictating system without charge. Favorable arrangements are also available with smaller volumes.

Then, transcriptions are as easy as picking up your phone and dictating directly to our high-security digital recording system. Expert medical transcriptionists enter your notes into our data banks for backup, return transmission and printout. At the same

time, you'll also be building a data base for easier conversion to electronic record keeping.

Transcriptions International's electronic system is today's answer for physicians, hospitals, clinics, HMOs, group practices, rehab centers, law firms or any business needing quick, accurate and economical transcriptions.

Call today for a no obligation proposal and talk to us about your dictation needs.

**For more details, call 1-(800)-348-4326.**

## ROCHE ME MEDICATION EDUCATION

Your Roche representative offers you access – without expense or obligation – to a comprehensive library of patient information booklets designed to supplement rather than supplant your rapport with your patients.

Each booklet helps you provide...

- Reinforcement of your instructions
- Enhancement of compliance
- Satisfaction with office visits

Your Roche representative will be happy to provide a complete catalog of available booklets and complimentary supplies of those that are applicable to your practice.

## A Clinical Moment With . . . Diabetes

### Management of a Juvenile Patient Who Resists Planned Diabetic Care

*Doctor: My eleven-year-old daughter developed diabetes about a year ago. At first she was very attentive about her diabetic care and adhered closely to her meal plan. Recently, she has been sneaking candy bars from vending machines and sometimes delaying her insulin injections. She has almost completely stopped doing blood glucose testing. How can I get her to take better care of herself?*

It is not unusual for diabetic patients, both children and adults, to be attentive and do well with diabetes management for a time, while later seeming to lose all interest in proper care. There are two approaches that should be used to cope with the situation. First, a good family counseling service should be contacted, and family group and individual meetings scheduled according to the service's recommendations. It is important that the family be involved and not just the child. Second, I would advise attendance at a summer camp for diabetic children. Fortunately, for Marylanders, Camp Glyndon is located near Reisterstown, Maryland. It is an excellent camp with extensive recreational and educational facilities. Peer influence and the training program are certainly helpful. I have never known anyone who attended a session who did not want to return the next year.

Camp Glyndon tuition is \$550.00 for a two-week session and \$260.00 for a one-week session, but every child may attend the camp through a liberal scholarship policy. Arrangements can be made for camping by contacting the American Diabetes Association, Maryland Affiliate, Inc., 2 Reservoir Circle, Suite 203,

Baltimore, MD 21208 (301-486-5515). The camping schedule for 1991 is:

Dates	Age Group
June 23 - July 5	13 - 15 years
July 7 - 12	Family session
July 14 - 26	10 - 12 years
July 28 - August 2	10 - 12 years
August 4 - 9	7 - 9 years
August 11 - 16	Family session

At this stage of a child's diabetic care, there is a greater than apparent amount of inner conflict and depression produced by the disease. Threatening measures and punishment are not helpful and should be avoided.

DeWITTE, DeLAWTER MD  
Editor

## Physicians in the Persian Gulf

---

Med Chi would like to recognize some of Maryland's dedicated physicians serving in America's armed forces who have been called to action because of "Operation Desert Storm" in Saudi Arabia:

R. Stephen S. Amato MD  
Homer C. House MD

Bruce A. Feldman MD  
Christian E. Jensen MD

Med Chi recently received correspondence from Christian E. Jensen MD, President of the Caroline County Medical Society and Naval Reserve Physician, who was recalled to serve in Saudi Arabia. Dr. Jensen is serving in a forward area as a member of Fleet Hospital 15- First Marine Expedition Force. He says the emphasis is on rapid, appropriate intervention for wounds or illness and the health of our marines and sailors is splendid. He also sends greetings from a fellow Maryland physician, also with his unit, Bruce Feldman MD of Bethesda. He adds that Americans participating in the allied forces are united in being thankful for the opportunity to participate in this historic service to their country and its fighting men and women.

If you know of a colleague who has been called to serve, please contact Med Chi's Public Relations Department at 301-539-0872 or 1-800-492-1056.

---

## Med Chi Responds to Sun Article on Medicaid

---

On March 4, 1991, Med Chi sent a letter to the Editor of *The Baltimore Sun* in response to *The Sun's* article on Medicaid funding. In the letter (below), Med Chi President Reynaldo L. Lee-Llacer MD clarifies Med Chi's position regarding the intentions of physicians and the Department of Health and Human Services:

To the Editor:

It is unfortunate that the perception conveyed in *The Sun's* recent article on the Medicaid funding (*The Sun*, February 10, 1991: "Maryland Officials push 'scam' to double Medicaid funds") was so misleading regarding the intentions of physicians and the Department of Health and Human Services Medical Assistance Program, as to cause such widespread misunderstanding.

Acting Health Secretary Nelson J. Sabatini's announcement is in reality a reiteration of the requirement for physicians to follow Maryland Medicaid regulations. Under these regulations (COMAR 10.09.02.07C), "Physicians shall charge the Program their usual and customary charge to the general public for similar services." Since some physicians bill for the amount that Medicaid pays (which is often less than the physician's usual fee), Maryland's Medicaid program was receiving less than appropriate funding from the Federal Government.

Mr. Sabatini's request is neither a collusion, nor a scam. Inflammatory terms such as these, result not only in less than objective reporting but also do a disservice to our State Legislators, State Executives and Maryland physicians, by suggesting they would intentionally propose illegal actions.

Maryland physicians would never follow a program such as the one insinuated in *The Sun's* original article.

Reynaldo L. Lee-Llacer MD  
President

---

## Evening Sun Article on BPQA

---

Two articles on the Maryland Board of Physician Quality Assurance (BPQA) appeared in the March 1, 1991 edition of *The Evening Sun* ("Medical Board Flaws Persist, Records Show" and "State Board Slow to Detect Doctor Who Failed, Lied"). Med Chi physicians should note the articles are misleading in that they refer to activity that took place during the first year of the BPQA. During that year, Med Chi caught up with a backlog left over from the Commission on Medical Discipline. As of March 1, 1991,

Med Chi has only 30 peer review cases in process. Of these, only ten are beyond the 90-day time frame and all of these are on extensions. In light of these articles, physicians should note that Med Chi's position on peer review is and will remain that review of medical practices should only be done by physician peers. Med Chi will make every effort to insure that this activity remains with physicians.

---

## AMA Resolutions

---

At the 1990 Interim Meeting in Orlando, FL, the AMA House of Delegates adopted five resolutions relating to the new Medicare physician payment system. The AMA will:

- continue to endorse the basic concepts of the Resource-Based Relative Value Scale (RBRVS) study and to explore legislative and regulatory means to accurately reflect practice costs of individual specialties, including, but not limited to, additional payment for supplies or equipment of unusual cost or frequency;
- seek to influence the Medicare Volume Performance Standards (MVPS) to prevent them from becoming an expenditure target or cap via regulation or legislation;
- seek an orderly review and comment by the Federation of State Medical Societies on the final proposed payment schedule;
- do whatever possible to ensure that the RBRVS payment schedule does not include behavioral adjustments; and
- review current proposals for incorporating malpractice costs in the payment schedule so that physicians will be paid for these costs in a fair and equitable manner.

In addition, reports on the RBRVS study, Medicare physician payment reform, and geographic practice cost indices (GPCIs) were submitted for the information of the House.

---

## Medicare Claims Reminder

---

Effective September 1, 1990, physicians and suppliers have been required by *law* to submit claims on behalf of Medicare beneficiaries. This requirement applies to assigned and unassigned claims. Physicians or suppliers may *not* charge for preparing and filing claims, and all claims must be submitted on the standard HCFA-1500 claim form.

---

## Ambulatory Surgery Center Services

---

Effective immediately, HCFA has established the new modifier code, "QL," to identify ambulatory surgery center services on Medicare claims. This modifier code must be shown with the appropriate procedure code on all Medicare claims for these facilities.

---

## HCFA Project

---

HCFA is involved in a demonstration project which started March 1, 1991 and is continuing through March 31, 1992. This project involves releasing national screens that Medicare's insurance carriers use for prepayment review. The project will determine if releasing these screens influence physician behavior.

Seven national screens will be studied--routine foot care, comprehensive office visits, skilled nursing facility visits, chiropractic visits, intermediate hospital visits, consultations, and comprehensive visits in all settings. However, the number and choice of screens to be released will vary from carrier to carrier. The carriers involved in this project are from Alabama, Arkansas, California, Colorado, Connecticut, Georgia, Idaho, Indiana, Kansas, Kentucky, New York, Texas, and Wisconsin.

## Revised Faculty Position on AIDS

---

---

## Physician's Practice Digest

---

---

## Committee Selection Cards for 1991-1992

---

---

## 1991 Annual Meeting

---

In February, the Executive Committee approved a revised Faculty Position on AIDS dealing with many aspects of the AIDS issue including testing of health care workers and patients, the physician's duty to treat, and improving access to care. For copies of the Faculty Position on AIDS or for copies of any other Faculty Position Paper, contact Med Chi's communications department at 301-539-0872 or 1-800-492-1056.

Later this month, Med Chi physicians will receive the spring issue of the *Physician's Practice Digest (PPD)*, Med Chi's new quarterly publication designed to meet the practice management needs of your medical practice. The theme of this issue is "Prescription for Recession" and features useful financial information for the 1990s. If you have any suggestions, opinions or an interest in contributing articles to the summer issue of *PPD*, please send correspondence to Editor, *Physician's Practice Digest*, 1211 Cathedral Street, Baltimore, MD 21201.

Med Chi thanks all physicians who have submitted postcards to serve on Med Chi committees during 1991-1992. Terms for these committees will run from May 11, 1991 until the last day of the annual meeting in May 1992.

For those members presently serving on Med Chi committees, please note that you serve on a committee for ONE YEAR ONLY. Unless otherwise specified in the Bylaws, CURRENT COMMITTEE APPOINTMENTS END ON THE LAST DAY OF THE 1991 ANNUAL MEETING (MAY 11).

To be appointed for a committee during 1991-1992, please indicate your committee preference(s) on the postcard following this newsletter.

The President will send letters to members appointed to committees in 1991-1992 after the annual meeting in May. (Some committee members may be required to serve after the annual meeting until the President can appoint a new committee.)

Med Chi thanks its members for their support of Med Chi and its committee work. It is only through the dedicated hard work of its volunteer physicians that Med Chi can continue to serve as an advocate for physicians and help improve health care for all Maryland citizens.

Physicians are reminded to preregister for Med Chi's 1991 Annual Meeting, "American Medicine Today, Perspectives from Maryland." A preregistration form is featured on page 288 of this *MMJ*. The meeting will be held on Wednesday, May 8 thru Saturday, May 11, 1991 at the University of Maryland Center of Adult Education in College Park, Maryland.

Special Guest Speakers to Attend Med Chi's Annual Meeting include:

- AMA President John C. Tupper MD who will address the entire membership;
- Senator John D. Rockefeller, IV (D-WV) who will speak Friday evening, May 11, at the Presidential Ball;
- The Reverend Joseph A. Sellinger, President of Loyola College, Maryland who will speak at the Prayer Breakfast on Thursday, May 9th;
- Mrs. Marilyn Quayle, National Breast Cancer Spokesperson\*;
- Mrs. Elizabeth Dole, President of the American Red Cross\*;
- Former Surgeon General C. Everett Koop MD\*.

Scientific sessions for this year's meeting include *HIV Today: Transmission, Testing and Treatment*; *Managing Diabetes in the 1990s*; *How to Help Your Pregnant Patients Stop Smoking*; *The Right to Die in Maryland 1991 (After Cruzan)*; *Treatment of Outpatient Infections*; and *Treatment of Chronic Pain in Patients with Advanced Cancer*.

\*Accepted invitation to meeting, coordinating schedules

Entertainment for this year's meeting includes a performance by the Capitol Steps, a political cabaret troupe from Washington, on Wednesday May 8. A PGA-celebrity golf tournament is planned for Thursday May 9. There will also be a dinner honoring Med Chi President Reynaldo L. Lee-Llacer MD on Friday, May 10. Call now to make your reservations for these events.

For more information on the Annual Meeting, call Michael Moran at 301-539-0872 or 1-800-492-1056.

---

### *New Address for Physician Rehabilitation Program*

---

Med Chi's Physician Rehabilitation Program is pleased to announce the relocation of its offices as of March 1, 1991. They have moved directly behind the Faculty Building to 1204 Maryland Avenue, Baltimore, MD 21201. Their new phone numbers are (301) 962-5580 and 1-800-992-7010 (toll-free). The program's 24-hour message line number remains the same: 301-727-0120

---

### *Medical Mutual's New MedGuard Coverage*

---

Medical Mutual now offers MedGuard Coverage to help physicians pay for the cost of retaining an attorney to defend them against disciplinary proceedings. Your current Medical Mutual professional liability policy already pays the cost of defending you against lawsuits involving allegations of medical malpractice by a third-party plaintiff or damages caused by your participation as a "judge" in a peer review process. The new MedGuard program will provide legal counsel if you are the subject of disciplinary proceedings. These proceedings can include hospital and/or HMO/PPO peer review, local and state society peer review, state licensure and disciplinary boards, National Practitioner Databank, Professional Review Organizations (PRO), and Medicare actions. MedGuard coverage is optional and is available for Medical Mutual members only. Coverage is available for individual professionals or professional organizations. If you wish to purchase MedGuard coverage, it will be added to your existing Medical Mutual policy. For more information about MedGuard, contact your Medical Mutual member service representative at 785-0050 or 1-800-492-0193.

---

### *Women In Medicine*

---

All Med Chi members are invited to attend the next meeting of the Women in Medicine Committee on April 18, 1991 at 6:30 p.m. in the Med Chi Faculty Building. Discussion topics for this meeting will include issues of interest to women physicians. Members are encouraged to bring a non-member guest with them to the meeting. If you plan to attend this meeting, contact Betsy Newman, Public Relations department at 301-539-0872 or 1-800-539-0872. (Please indicate if you require babysitting.)

---

### *Photo Contest*

---

All Med Chi physicians and auxiliary members are invited to express their photographic talents in the 1991 Med Chi Photo Contest. First and second prizes will be awarded for black and white and for color photographs and all entries will be displayed during the 1991 Annual Meeting at the University of Maryland Center for Adult Education in College Park. Deadline for entries is April 19, 1991. For more details on the contest, see the ad on page 302.

  
Angelo J. Troisi, F.A.C.H.E.  
Executive Director

**I**f effectively meet your needs as a Maryland physician, Med Chi must maintain an extensive framework of committees to uphold prior commitments, manage current programs, and formulate new policy. It is essential that these committees be comprised of interested members so that Med Chi will remain a strong, viable, and active organization.

Please indicate your willingness to serve by checking your committee preference and special interests on the reply card. Every effort will be made to appoint you to the committee of your choice.

I intend to appoint as many members as possible to committees to insure Med Chi's continued growth as the leading voice for medicine in Maryland.

Thank you for your support.  
J. David Nagel MD  
President-elect

I am interested in serving on the following Med Chi committees.

- ☐ AIDS Committee
- ☐ Alcoholism and Chemical Dependency Committee
- ☐ Computers in Medicine Committee
- ☐ Continuing Medical Education Review Committee
- ☐ Drugs Committee
- ☐ Emergency Medical Services Committee
- ☐ Finance Committee
- ☐ Hospital Medical Staffs Committee
- ☐ Insurance Fund of Med Chi Committee
- ☐ Legislative Committee
- ☐ Liaison Committee with Medical Assistance Program
- ☐ Library and History Committee
- ☐ Long Term Care and Geriatrics Committee
- ☐ Managed Care and Third Party Liaison Committee
- ☐ *Maryland Medical Journal* Editorial Board
- ☐ Medicine and Religion Committee
- ☐ Mediocolegal Committee
- ☐ Other Interests: \_\_\_\_\_

- ☐ Mental Health Committee
- ☐ Music Medicine Clearinghouse Committee
- ☐ Occupational Health Committee
- ☐ Peer Review Committee
- ☐ Physician/Patient Relations Committee
- ☐ Physician Rehabilitation Committee
- ☐ *Physician's Practice Digest* Editorial Board
- ☐ Professional Ethics Committee
- ☐ PRO Monitoring Committee
- ☐ Public Health Committee
  - ☐ Immunization and Infectious Diseases Subcommittee
  - ☐ Infant, Child & Adolescent Health Subcommittee
  - ☐ Maternal Welfare Subcommittee
  - ☐ Sports Medicine Subcommittee
- ☐ Public Relations Committee
- ☐ Small Area Practice Variations Committee
- ☐ Specialist Identification Committee
- ☐ Specialty Societies Committee
- ☐ Young Physicians Committee

*"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."*

Theodore C. Patterson, M.D., Medical Director,  
Meridian Nursing Center—Heritage

#### ***Partners in Healthcare***

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dietitians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—  
The Professional Choice.

# MRI UPDATE

Figure 1

Figure 2

**CLINICAL HISTORY:** This is a 26-year-old male with back pain and right lower extremity radiation.

**FINDINGS:** This is an example of a normal study on a young adult. **COMMENT:** MRI is the screening test of first choice for suspected disorders of the lumbar spine. Notice the clear depiction of the normal L5-S1 disc (figure 1, crossed arrow). The discs of this patient exhibit high signal intensity reflecting normal hydration and none of the discs are narrowed. None of the discs indent the thecal sac which is of intermediate signal intensity and appears as the gray band in the center

of the image. The vertebral bodies are homogeneous and free of destructive lesions. The conus medullaris (arrow) is normal. This sagittal image demonstrates the advantages of MRI over other screening modalities. Routine CT scanning will not display the conus medullaris, lesions of which may masquerade as disc herniation. The general area of coverage is superior with MRI. Disc detail is much better displayed with MRI.

The axial image at L5-S1 (figure 2) exhibits delineation of intraspinal detail far superior to that of CT. The right S1 nerve root is clearly displayed (arrow) surrounded by normal perineural fat

which is the bright high intensity material in the periphery of the spinal canal. State-of-the-art MR images clearly display the bony anatomy of the lumbar spine including the facet joints (crossed arrow). Degenerative diseases and bony neoplasm are routinely detectable.

MRI involves no ionizing radiation and no intrathecal contrast material is needed. It is a patient-friendly outpatient examination well suited for screening purposes.

**Maryland  
Magnetic  
Imaging**

900 Toll-House Avenue  
Frederick, MD 21701  
(301) 662-0077

Health Images facilities operate their MRI systems with all available upgrades including contiguous thin slices, high resolution head and body coils, state of the art surface coils, and cardiac gating.

Health Images facilities are a community resource available to all area physicians.

*Health Images, Inc.®*

## EPIDEMIOLOGY & DISEASE CONTROL PROGRAM

201 W. Preston Street, Baltimore, Maryland 21201 (301)225-6700

April 1991

### LYME DISEASE UPDATE

Test your knowledge about Lyme disease! Match the correct response(s) from the column on the right with the question on the left; note that several questions have more than one correct response. Responses may be used once, more than once, or not at all.

#### Questions:

1. List Maryland counties in which Lyme disease is endemic:  
\_\_\_\_\_
2. List features that are sufficient for diagnosis of Lyme disease:  
\_\_\_\_\_
3. List complications of Lyme disease:  
\_\_\_\_\_
4. The causative agent of Lyme disease is : \_\_\_\_\_
5. Species important in the maintenance of Lyme disease are: \_\_\_\_\_
6. Risk factors for Lyme disease include: \_\_\_\_\_
7. List measures that are useful in preventing Lyme disease:  
\_\_\_\_\_
8. Antibiotics used to treat Lyme disease include : \_\_\_\_\_

#### Answers:

- a. The white-tailed deer
- b. Arthritis
- c. Howard County
- d. Baltimore County
- e. *Borrelia burgdorferi*
- f. *Aedes aegypti*
- g. Outdoor activities
- h. Erythema migrans
- i. The white-footed mouse
- j. Cardiac conduction abnormalities
- k. Frequent tick checks
- l. Positive Lyme disease serology
- m. Renal failure
- n. Encephalitis
- o. Amoxicillin
- p. Light colored clothing
- q. *Ixodes dammini*
- r. Aztreonam
- s. Pets
- t. Bell's palsy
- u. Tick exposure
- v. Doxycycline
- w. Cecil County
- x. Insect repellent
- y. *Francisella tularensis*
- z. Prince George's County

## How well did you do?

1. Lyme disease is considered to be endemic in Howard (c), Baltimore(d), Cecil (w) and, Prince George's (z) counties. In fact in 1991, Lyme disease is considered endemic in all parts of Maryland except for the western counties.

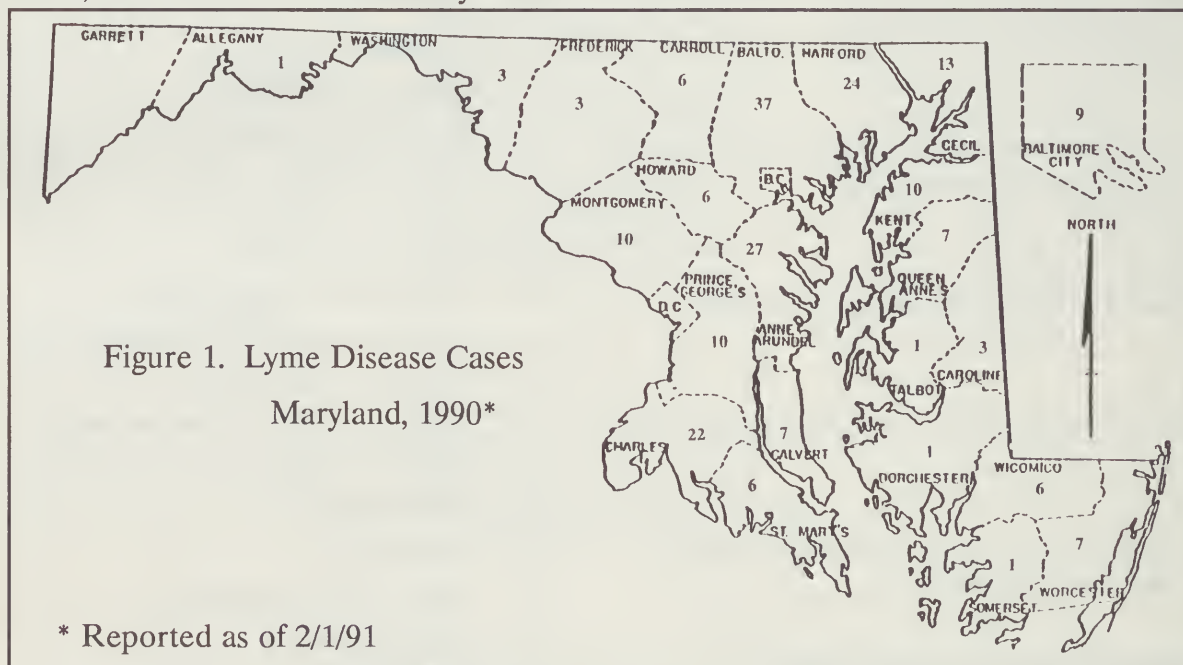

Lyme disease is the most prevalent vector-borne illness in the United States. Lyme disease is endemic (present constantly even if at low transmission rates) in most of the United States, including most of Maryland, although the majority of cases (94%) of Lyme disease reported to the Centers for Disease Control (CDC) in 1987 and 1988 (the last years for which data are available) came from nine states: New York, New Jersey, Wisconsin, Connecticut, Pennsylvania, Rhode Island, California, Massachusetts and Minnesota<sup>1</sup>. In 1989, there were 138 cases of Lyme dis-

rett (Figure 1). The counties with the highest number of cases were Baltimore, Anne Arundel, Harford and Charles; cases from these four counties represented 50% of the Maryland total.

Lyme disease was added to the list of reportable infectious diseases in Maryland in 1989; therefore, all confirmed and suspected cases should be reported to your local health department on a Maryland Confidential Morbidity Report card (DHMH-1140).

2. Erythema migrans (h) is sufficient for the diagnosis of Lyme disease. Positive Lyme serology (l) and self-reported tick exposure (u) are not sufficient for diagnosis of Lyme disease.

Erythema migrans (EM, formerly known as erythema chronicum migrans, or ECM) is the classic rash of Lyme disease, which

ease reported in Maryland; the data for 1990 are not yet complete, but so far 220 confirmed cases have been reported. This number includes only those reported cases that met the CDC surveillance case definition. It is likely that the true number of cases that occurred in Maryland last year was much higher.

In 1990, there were confirmed Lyme disease cases reported from residents of Baltimore city and all counties except Gar-

rett when present in an endemic area, is sufficient for diagnosis. EM develops in 60-80% of patients, usually a few days after the tick bite, but sometimes up to one month later. The rash usually starts at the site of the tick bite, as a red patch which expands centripetally. The patch usually has central clearing, and has been described as a bull's-eye or a target lesion; there may be multiple lesions. For Centers for Disease Control surveillance

purposes, EM must measure at least 5 cm. The rash may be warm but is usually not raised, painful or itchy. Other early symptoms of Lyme disease include fever, headache, fatigue, myalgias and regional lymphadenopathy.

A positive serologic test alone is not sufficient for diagnosis of Lyme disease, and, likewise, a negative serologic test does not rule out Lyme disease, for several reasons:

- a) It takes IgM 3-6 weeks to peak after illness onset, and IgG even longer, so serologic tests at the time of EM or other early symptoms are likely to be negative.
- b) Treatment with antibiotics, recommended during the early stages of the disease to prevent late complications, may interfere with the development of antibodies, so that even convalescent serology may be negative.
- c) The commercial tests currently available, indirect fluorescent antibody (IFA) and enzyme-linked immunosorbent assay (ELISA) have been shown to be unreliable from laboratory to laboratory, and even within the same laboratory<sup>2</sup>.

A history of tick bite, without symptoms of Lyme disease, is not sufficient to predict development of Lyme disease. Due to the small but real risk of adverse effects from unnecessary antibiotic use, it is not routinely recommended to treat patients with tick bites prophylactically with antibiotics.

**3. The complications of Lyme disease include arthritis (b), cardiac conduction abnormalities (j), encephalitis (n), and Bell's palsy (t). Renal failure (m) is not a common complication of Lyme disease.**

The organ systems most likely to be affected by complications of Lyme disease are the joints, the nervous system, and the heart.

Arthritis of one or more joints is the most common late complication of Lyme disease. Neurologic complications include Bell's palsy, carpal tunnel syndrome,

peripheral polyneuropathy, optic neuritis and encephalitis. Cardiac complications include cardiac conduction abnormalities, often involving the AV node, tachycardia and palpitations.

Late symptoms usually appear months after exposure, and often require intensive parenteral antibiotic therapy. Even when aggressively treated, these complications may become chronic.

**4. The organism which causes Lyme disease is the spirochete *Borrelia burgdorferi*(e). *Francisella tularensis* (y) is the organism responsible for tularemia and is incorrect.**

**5. The white-tailed deer (a), the white-footed mouse (i) and *Ixodes dammini* (q) are species important in the maintenance of Lyme disease; *Aedes aegypti* (f) is not.**

The primary vector for transmitting the spirochete *Borrelia burgdorferi* to humans is the deer tick, *Ixodes dammini*, although the spirochete has been found in other species of tick. *Ixodes dammini* feeds on the white-footed mouse during its nymphal stage, and feeds on the white-tailed deer as an adult. The nymphal tick, which is found in the spring and early summer, is thought to be more important than the adult tick in transmitting Lyme disease, but the adult tick can also transmit the disease, so cases may occur through the fall. Humans are incidental hosts to *Ixodes* ticks, and are not important in their life cycle.

*Aedes aegypti* is a species of mosquito, which has a role in the transmission of yellow fever, but has nothing to do with Lyme disease.

**6. Risk factors for Lyme disease include outdoor activities (g) and tick exposure (u). Pets (s) are only speculated to be a risk factor.**

The major risk factor for development of Lyme disease is exposure to outdoor areas where *Ixodes* ticks are found. Outdoor activities, especially in wooded areas, but potentially in any unpaved areas, has been shown to be a risk factor for Lyme disease<sup>3,4</sup>. Other high risk activities in-

clude hunting, fishing, and camping. Only half the patients who develop EM recall a recent tick bite. As a result, self-reported tick exposure is not well correlated with true tick exposure, and many studies have shown that patients with Lyme disease deny a preceding tick bite.

Studies detecting antibody to tick salivary antigen (ATSA), a new serologic tool for detection of recent exposure to *Ixodes dammini*, have shown that people are not accurate in their assessment of tick exposure<sup>5</sup>. ATSA has promise as a research tool in defining populations at risk for development of Lyme disease, as well as a means to determine the effectiveness of measures designed to reduce exposure to ticks. Pet ownership has not yet been demonstrated in epidemiologic studies to be a consistent risk factor for Lyme disease.

**7. Measures useful in preventing Lyme disease are frequent tick checks (k), wearing light colored clothing (p), and using insect repellant (x).**

Lyme disease can be prevented by preventing tick bites. When in an area where exposure to ticks is likely (any wooded area in Maryland), a combination of several preventive measures may be useful:

- a) wearing light colored clothing so that ticks can be seen;
- b) frequent tick checks;
- c) covering as much skin as possible (hats, long sleeves, long pants, shoes and socks instead of sandals); and
- d) using insect repellents.

**8. Antibiotics used to treat Lyme disease include amoxicillin(o) and doxycycline (v). Aztreonam (r) is not used to treat Lyme disease.**

Oral antibiotic therapy is very effective in treating the early manifestations of Lyme disease; recommended antibiotics are doxycycline or amoxicillin<sup>6</sup>. Although a longer course is required, these are also the drugs recommended for mild late neurologic or cardiac complications, for example, Bell's palsy or first degree AV block with PR interval for less than 0.30 seconds.

For serious and late neurologic or cardiac complications, such as encephalitis or heart block, parenteral therapy with penicillin G or ceftriaxone is recommended. Lyme arthritis may be recalcitrant to treatment with antibiotics, but usually improves gradually; more than one course of antibiotics is sometimes needed, with alternative drugs used in cases of treatment failure.

Aztreonam is most effective in treating infections caused by gram-negative bacteria, and has no place in the treatment of Lyme disease.

Prepared by Marianne Cloeren, M.D., M.P.H., Johns Hopkins School of Hygiene and Public Health.

The Maryland Department of Health and Mental Hygiene is planning a joint project with investigators from Johns Hopkins School of Hygiene and Public Health to determine the risk factors of Lyme disease cases in Maryland. Because this study involves, in part, time-dependent serologic testing of patients with Lyme disease, physicians are encouraged to:

**Report suspected cases of Lyme disease as soon as possible to the local health department.**

### The Prognostic Value of Mononucleated Cell Levels in Cancer Patients

It has long been accepted that a primary part of the host's defense mechanism against cancer is immunologic in nature. Human subjects and experimental animal models do produce antibodies, or more specifically, sensitized cytotoxic lymphocytes directed against neoplasms.<sup>1-7</sup> It has also been reported that the intensity of lymphocytic action in and around a tumor and the activity of local lymph nodes correlate directly with the patient's prognosis and inversely with the probability of metastases.<sup>8-10</sup> Patients with cancer who are unable to mobilize an immune response have more metastases and a worse prognosis than patients who are immune suppressed.<sup>11,12</sup> Suppression of the immune response in humans and animals correlates with an increased incidence of many types of cancer. Hellstrom and colleagues<sup>7</sup> were the first to describe specifically sensitized anti-tumor lymphocytes. However, less attention has been paid to the absolute counts of mononucleated cells in the peripheral blood, which are the immune modulators.

We studied fifty-five patients with histologically proven primary epidermoid carcinoma of the head and neck region who were treated surgically. All patients were in satisfactory nutritional status, their actual weights were within the ideal range, and their serum albumin levels were 3.5 g/dl or higher. Fourteen patients had stage I or II disease characterized by primary tumors up to 4 cm in diameter with no palpable regional lymph nodes. They were treated with wide resection of the primary disease with pathologically proven negative tumor margins. The other forty-one patients had stage III or IV disease with primary tumors over 4 cm. They were managed by wide resection of the primary disease and radical neck dissection followed by radiation therapy. Ten patients were found to have no regional lymph node metastases, whereas the other thirty-one patients had regional lymph node metastases ranging in size from 1 to 6 cm on one or both sides of the neck.

Peripheral blood samples were obtained from each patient for complete blood counts and differential counts at the time of diagnosis, before surgery, and before any therapy. Data were expressed as the percentage of lymphocytes and monocytes rather than as actual counts to avoid the large variations due to the absolute white cell count, which ranged from  $4-12 \times 10^3$  cells per cubic millimeter. These data were then correlated with the stage of the disease, length of disease-free survival, patient's age, and sex.

The results revealed that the initial lymphocyte percentages (i.e., prior to any therapy) correlated with the stage of the disease. Patients with stage I or II disease had a mean lymphocyte percentage of 33 percent, while those with stage III or IV disease with negative lymph nodes had a lymphocyte percentage of 26 per-

cent. Data analysis revealed that the p value equaled 0.104, which was not statistically significant. However, the lymphocyte percentage for patients with stage III and IV disease with metastases to the regional lymph nodes was 23 percent. The data analysis comparing the lymphocytes of patients with negative lymph nodes to those with positive lymph nodes resulted in a significant p value equal to 0.006. On the other hand, patients with stage I and II disease had a mean monocyte count of 5.4 percent compared to 8.3 percent for those with stage III and IV disease with negative lymph nodes ( $p = 0.04$ ). Furthermore, patients with stage III and IV disease with positive lymph nodes had a mean monocyte count of 9.3 percent with a statistically significant p value equal to 0.028 when compared to the monocytes of the other two groups.

Patients with 30 percent or more lymphocytes had a recurrence rate of 13.6 percent during the first year, whereas those with less than 30 percent had a 69 percent recurrence rate during the same period; this was irrespective of the stage of disease ( $p = 0.0003$ ).

These data suggest that the initial peripheral mononucleated cell values correlate with the stage of the disease and the recurrence rate in the first year after definitive therapy, regardless of age and sex. In addition, it should be noted that obtaining lymphocyte and monocyte counts is an inexpensive test performed routinely in every clinical laboratory, and does not require any special or expensive immunologic facilities.

Although we cannot hypothesize whether the decreased lymphocyte and increased monocyte values follow or precede progression of the disease, periodic monitoring of the mononucleated cell levels during follow-up of such patients could reflect on the recurrence and survival rates.

In summary, while it has been established that the stage of the disease at the time of diagnosis carries the most significant prognostic factor, it seems that other prognostic factors at the time of diagnosis may play an additional prognostic role. It also seems that higher lymphocyte values in cancer patients carry a better prognosis. Conversely, higher monocyte values correlate with poor prognosis. Such observations should be monitored in every clinical practice.

## THE MRI CENTER AT MARYLAND GENERAL HOSPITAL — A NEW RESOURCE FOR MARYLAND PHYSICIANS

Maryland General Hospital has installed a Picker Vista MRI 1.0 Telsa Scanner. This system permits high resolution, thin slice imaging capability and small fields of view, all with superior image quality.

Our System and services offer many benefits to area physicians...

- Convenient patient appointments.
- A dictaphone voice retrieval system which allows instant access to dictated MRI reports from any telephone including home, office or even car phones.
- A large magnet gantry and table to accommodate large or obese, and claustrophobic patients up to 300 lbs.
- Twenty-four hour or less report turn around.
- A financial counselor to facilitate MRI payments.
- Actual copy of study available to physician upon request.

The MRI Center at Maryland General Hospital  
827 Linden Avenue Baltimore, Maryland 21201  
301-225-8121

- EXTRA and the "Thermolds" shoes
- Accomodative, impression molded inlays, for proper weight distribution, made of PLASTIZOTE or PELITE
- Complete line of SPENCO products
- Custom MOLDED footwear as required
- Outside fitting in home or hospital
- Also—Complete prescription service, including many special purpose shoes and shoes suitable for brace attachment

# Harbor Hospital Center: Preparing Physicians for the Future

---

Colen Heinritz MD

---

*Dr. Heinritz is Director of Medical Education, Harbor Hospital Center, Baltimore, MD.*

I am pleased to introduce in this issue the investigative work of residents at Harbor Hospital Center. Graduate education gives residents the opportunity to investigate and report interesting clinical observations. Our faculty encourages and assists all residents in preparing papers for submission to medical journals and for presentation at Maryland's annual American College of Physician Associates meeting.

In this issue, Drs. Weiss and Hrehorovich describe a previously unreported urethral involvement which heralded the reactivation of Wegener's disease ten years after initial chemotherapy. Dr. Dart and colleagues document the lack of prognostic efficacy of the widely used and highly regarded APACHE II for patients with cancer. Drs. Riaz and Selonick prospectively documented a 44 percent incidence of myocardial infarction in patients admitted to cardiac care units with pulmonary edema. Drs. Alegado and Mardelli report the apparent successful treatment of postpartum cardiomyopathy with immunosuppressive agents. Dr. Conrado emphasizes the need for prompt recognition of spontaneous splenic ruptures in non-Hodgkin's lymphoma.

Our house staff and faculty are pleased to share their work with *Maryland Medical Journal* readers and thank *MMJ* for this opportunity.

---

The *MMJ* will contain additional papers from residents at Harbor Hospital Center in the May issue.

# **We pay attention to every detail.**

With today's advanced medical technology, we're able to produce diagnostic images of remarkable complexity, clarity and detail. Which is why our head and body MRI imaging services are so valuable to you and your patients.

Magnetic Imaging of Baltimore's (MIB) dedicated radiologists and staff provide your patients with the care and experience you expect. We are able to schedule your patients within 24 hours of their request at our convenient location on the campus of Greater Baltimore Medical Center.

At Magnetic Imaging of Baltimore, we realize what a difference the details can make. So take a closer look. You might discover something your patients should know about.

# An Unusual Manifestation of Wegener's Granulomatosis

---

Robert D. Weiss MD and Victor R. Hrehorovich MD

---

*Dr. Weiss is completing a Pulmonary Critical Care Fellowship at the University of Pittsburgh Medical Center, Pittsburgh, PA. Dr. Hrehorovich is Director of the Department of Medicine, Harbor Hospital Center, Baltimore, MD.*

**W**egener's granulomatosis is a rare vasculitis usually affecting the respiratory tract and the kidneys. We recently had the opportunity to manage a patient presenting with an unusual manifestation of this disease ten years after the initial diagnosis.

---

*Unusual manifestations of Wegener's granulomatosis, such as urethral involvement, should be treated aggressively to prevent full-blown reactivation of the disease.*

---

## Case Presentation

G.L. is a seventy-three-year-old male who presented with hematuria of three-weeks duration in 1988. Wegener's granulomatosis had been diagnosed by lung biopsy in 1978 after a chest x-ray revealed multiple pulmonary nodules and diffuse infiltrates. The medical history was also significant for hypertension, transurethral resection of prostate for benign prostatic hypertrophy, hemorrhagic cystitis, hydronephrosis, angina pectoris, and urinary tract infection. Medications included atenolol and prazosin. Physical exam revealed a well-developed, well-nourished male in no apparent distress with stable vital signs and a positive S4 gallop. Lung fields were clear. Laboratory data revealed 2+ protein, few bacteria, 50-60 wbc/hpf (white blood cell/high-power field), and 45-55 rbc/hpf (red blood cell/high-power field) in urine. A complete blood count (CBC) showed a white blood count (WBC) of 5,800. Blood urea nitrogen (BUN) was 24 and creatinine was 1.9. Chest x-ray (Figures 1 and 2) showed resolution of the nodules noted in 1978, and interstitial scarring.

On his second hospital day, he underwent cystoscopy with urethral dilatation and biopsy. Cystoscopy and biopsy were repeated on his fifth hospital day. He was discharged on his eighth hospital day. Biopsy specimens were taken from the prostatic urethra as well as from the bladder neck. These were positive for necrotic granuloma, giant cell, and vessels with vasculitis similar to his lung tissue and consistent with Wegener's granulomatosis (Figure 3). Specimens were sent to The National Institutes of Health (NIH) for confirmation. A representative slide taken from G.L. at the time of his initial, diagnostic, open-lung biopsy in 1978 is shown in Figure 3.

## Discussion

Wegener's granulomatosis is a systemic necrotizing vasculitis. Involvement of the upper respiratory tract is typical and is manifested by chronic progressive inflammation, mucosal ulcerations, chronic purulent sinusitis with or without rhinitis, nasoseptal perforation, saddle nose deformity, otitis media, and orbital extension. Lower respiratory tract involvement may include tracheobronchial erosions, pneumonitis, and cavity formation. Renal involvement is characterized by segmental necrotizing glomerulonephritis and progressive renal insufficiency. Reported, but rarely involved, are the gastrointestinal tract, heart, and peripheral nerves.<sup>1</sup>

In an intensive literature search, only one case was found in which the lower urinary tract was affected. University Hospital in Rotterdam, The Netherlands, reported a case of retroperitoneal involvement of Wegener's granulomatosis with extrinsic compression of a ureter.<sup>2</sup> No cases were found intrinsic to the lower urinary tract.

At follow-up, G.L. presented to his personal physician complaining of blood-streaked sputum. He went on to suffer massive hemoptysis, congestive heart failure, and pneumonia, leading to respiratory failure. He was intubated and started on Cytosan® and steroids. This second hospitalization was also complicated by myocardial infarction. However, he did have gradual improvement and was discharged three weeks after admission.

We believe the lower urinary tract involvement in the first hospitalization signaled the reactivation of his vasculitis with pulmonary and possibly coronary involvement. We would like to alert the medical community to such unusual manifestations of Wegener's disease (i.e., urethral involvement), so that such manifestations may be treated aggressively in the hope of preventing full-blown reactivation of the disease.

# Prognosis of Oncology Patients Receiving Intensive Care Using the APACHE II Scoring System

---

Robert Dart MD, Bhavdipkumar Patel MD, Jorge Perez-Alard MD, Surender Vaswani MD, and Sita Yanamadala MD

---

*Dr. Dart is an internist in private practice in Baltimore, MD. Drs. Patel, Perez-Alard, Vaswani and Yanamadala are house staff at Harbor Hospital Center, Baltimore, MD.*

---

*In a study at Harbor Hospital Center, the Acute Physiology and Chronic Health Evaluation (APACHE II) system greatly underestimated and was, therefore, not useful as a predictor of mortality for patients with oncological disorders.*

---

Intensive care began with the close observation of acutely ill, postoperative patients in one room of a hospital. Today, nearly every hospital with 200 or more beds has an intensive care unit (ICU), whereas in 1960 only 10 percent of such hospitals had ICUs.<sup>1</sup> This growth, however, has been an expensive one. ICU beds are three times the cost of regular hospital beds and ICU costs comprise as much as 20 percent of some hospital budgets.<sup>2</sup> Consequently, hospitals continually scrutinize the use of ICU resources to ensure that they are being used effectively.

One way to evaluate the effectiveness of ICU resources is to compare actual outcomes of treatment to predicted outcomes. Among the methods used to predict mortality among ICU patients is the Acute Physiology and Chronic Health Evaluation (APACHE II) Severity of Disease Classification System.<sup>3</sup> Various studies using APACHE II data have demonstrated a strong and stable relationship between severity of illness and subsequent probability of death from certain diseases commonly treated in the ICU.<sup>4</sup>

The following study examines whether the APACHE II system can be used to predict the mortality of patients who are admitted to the ICU with oncological disorders.

## Patients and Methods

The Harbor Hospital Center is a 376-bed community hospital serving communities surrounding the southern Baltimore area and northern Anne Arundel County in Maryland. The hospital contains sixteen ICU beds shared by surgical and medical admissions.

Data were collected on 842 consecutive medical admissions to the ICU from December 1985 through December 1987. Internal Medicine residents, during their rotations through the ICU, maintained a list of the patients admitted to the medical service either from the emergency room, the hospital floor, or the operating room, and noted whether the patients had underlying malignancies.

Within twenty-four hours of admission, medical interns recorded certain physiologic data on each patient including vital signs; results of arterial blood gas; white blood cell count;

hematocrit; serum sodium, potassium and creatinine levels; and Glasgow coma scale. Also recorded were the reason for admission, whether the patient was immunocompromised or chronically impaired, and whether certain therapeutic interventions were used during the first twenty-four hours.

The data were inserted into the APACHE II computer program, developed by the George Washington University Medical Center.<sup>3,5,6</sup> The final product of the APACHE II system is a computation of each patient's percentage risk of dying in the hospital during the admission. The system calculates this by assigning points depending on how much each of eleven physiological values deviates from the normal. Points are also assigned for advanced age and for a history of severe organ system insufficiency or immunocompromised states. Patients in this latter category include those with cirrhosis, esophageal varices, hepatic encephalopathy, Class IV heart disease, severe chronic obstructive pulmonary disease (COPD) or renal failure on dialysis, or those receiving immunosuppressive therapy. There is a direct relationship between the sum of the above points and predicted hospital mortality, derived from a multiple logistic regression equation using a factor for the particular disease category that brought the patient to the ICU.

Patients were followed through their entire hospital admission, even if transferred from the ICU to the hospital floor. Hospital mortality included those patients who died in the ICU or on the floor after transfer from the ICU, but before discharge from the hospital. Mortality data were compiled on an ongoing basis. The statistical significance of the composite data were tested using a chi-square test.

## Results

A total of 842 ICU patients, including 76 oncology and 766 non-oncology patients, were part of this study (Table 1). The total number of deaths (i.e., the observed mortality) was 303, or 36 percent. There were 250 deaths among the 766 non-oncology patients, for an observed mortality of 33 percent. There were fifty-three deaths among the seventy-six oncology patients, for an observed mortality of 70 percent. The difference in mortality rates between non-oncology and oncology patients was statistically significant.

Using APACHE II, the expected mortality for all patients in the study was 32 percent (Table 2). The percentage difference (not the absolute difference) between the observed mortality and the expected mortality was 11 percent. The expected mortality for

non-oncology patients was 31 percent, only 6 percent below the observed mortality. The expected mortality for oncology patients was 46 percent, which was 52 percent below the observed mortality. The difference between the observed and expected mortality among cancer patients was statistically significant.

We then subdivided the group of oncology patients into those with hematological malignancies and those with non-hematological malignancies (Table 3), because a previous study in another hospital found that APACHE II could not accurately predict mortality for patients with hematological malignancies.<sup>7</sup> In our study, there were thirteen deaths among the twenty-one patients with hematological malignancies -- an observed mortality of 62 percent. There were forty deaths among the fifty-five patients with non-hematological malignancies -- an observed mortality of 73 percent.

The expected mortality among patients with hematological malignancies (Table 4) was 57 percent, only 9 percent below the observed mortality. This was a surprising finding in view of the previous study. In contrast, the expected mortality among patients with non-hematological malignancies was 42 percent, or 75 percent below the observed mortality. This difference was statistically significant.

In order to determine whether there was a difference in mortality among the various types of cancer, we stratified the oncology patient group (Table 5). The only type of malignancy for which there were a sufficient number of patients was lung cancer. The observed mortality of 76 percent among lung cancer patients was 67 percent higher than the predicted mortality (Table 6).

Among all oncology patients, our specificity (i.e.,

**Table 1. Study Patients: Mortality**

	No. Patients	No. Deaths	Observed Mortality	P Value
Oncology	76	53	70%	
Non-oncology	766	250	33%	<.005
Total	842	303	36%

**Table 4. Oncology Patients: Observed v Expected Mortality**

	Observed Mortality	Expected Mortality (APACHE)	Percent Difference	P Value
Non-hematological	73%	42%	75%	<.005
Hematological*	62%	57%	9%	

\*Multiple Myeloma, Lymphoma, Leukemia

ability to predict correctly those who lived) was 83 percent and our sensitivity (i.e., ability to predict correctly those who died) was 48 percent (Table 7). The predictive value of a positive test was 86 percent and the predictive value of a negative test was 43 percent. We multiplied each patient's APACHE II risk of death by 1.52 to take into account the 52 percent difference between the observed and predicted mortality of the oncology patients as a group. The adjusted specificity dropped to 58 percent but the adjusted sensitivity increased to 73 percent (Table 8). The predic-

tive value of a positive test was 79 percent, and the predictive value of a negative test was 50 percent. (Riegelman's statistical format was used.<sup>8</sup>) Predictive value calculations have important clinical implications, answering the question of how good a test is at ruling in or ruling out disease.<sup>8</sup> In this case, predictive value answers the question of how good the APACHE II system is at predicting death and survival.

## Conclusions

Two of our findings were significant: The mortality rate for oncology patients entering our ICU was much higher than the mortality rate for non-oncology patients, and the mortality rate for oncology patients was higher than we could predict using the APACHE II scoring system.

Our finding that the mortality rate for oncology patients was much higher than the mortality rate for non-oncology patients is supported by previous studies showing a diagnosis of neoplasm to be a factor associated with poor prognosis. These studies have documented mortality rates up to 96 percent among certain groups of oncology patients, such as those with lymphoma and respiratory failure.<sup>7,9-11</sup>

The high mortality among cancer patients is understandable given their tendency to develop dysfunction of increasing numbers of critical organ systems.<sup>12</sup> Among the more common problems are acute respiratory insufficiency, electrolyte imbalance, sepsis, renal failure, cardiac arrhythmias, congestive heart failure, shock, liver failure, coagulopathies, and gastrointestinal (GI) bleeding.<sup>11</sup> Renal failure alone has been shown to be associated with a 90 percent mortality rate,<sup>13</sup> and prognosis worsens as the number of organ systems that fail increases.<sup>14</sup> Chemotherapy and radiation therapy predispose cancer patients to various hematologic abnormalities, including anemia which compromises oxygen delivery, leukopenia which is associated with sepsis, thrombocytopenia which can lead to GI bleeding, and disseminated intravascular coagulopathy.<sup>12,14</sup>

In part, this explains why the mortality rate for our oncology patients was even higher than we could predict using the APACHE II scoring system. Although prognosis worsens as the number of failing organ systems increase,<sup>15</sup> the APACHE II system adds five chronic health points regardless of whether one organ system -- or four -- are compromised.

Another explanation for APACHE II's underestimation of mortality among our oncology patients is that many patients were admitted to the ICU for reasons other than their underlying malignancy. With one exception (respiratory failure from neoplasm), there are no specific disease categories in the APACHE II system that apply directly to oncology patients.

APACHE II was designed, in part, to plan for regional ICU needs, to make outcome comparisons, to evaluate new technology, and to determine who

Call (717) 558-7750 for more information.

benefits from various therapies. Recently, for example, APACHE II was used to determine which patients would benefit from total parenteral nutrition (TPN).<sup>14</sup> APACHE II can also be used to make triage decisions during times of high demand for ICU beds. We believe that the APACHE II greatly underestimates the severity of illness among oncology patients and, therefore, should be adjusted so that such decisions can be based on accurate data. Since multi-system failure is one way in which oncology patients often differ from non-oncology patients, the APACHE II system should be modified so that the APACHE II score and attendant risk of death increase as the number of organ systems that fail increase. In fact, a new revised APACHE III will be available soon.

In the short run, we recommend multiplying the risk of death for oncology patients by a factor that reflects the difference between the observed and predicted mortality in these patients. However, such a factor should only be applied to a group of patients, as sensitivity and specificity are still unacceptable when the factor is applied to individual patients.

# Myocardial Infarction in Pulmonary Edema

---

Syed M. A. Riaz MD and Martha Selonick MD

---

*Dr. Riaz is a member of the house staff and Dr. Selonick is an attending physician in the Division of Cardiology at Harbor Hospital Center, Baltimore, MD.*

**P**ulmonary edema is a common condition encountered in Harbor Hospital Center. Patients presenting with this condition are customarily admitted to either the intensive care unit (ICU) or to a monitored floor. However, there has been some debate as to whether such patients can safely be placed on the general medical floor (GMF) once they are stabilized in the emergency room (ER). Equally controversial has been the length of time patients with pulmonary edema need to stay in the ICU. This issue revolves around the incidence of myocardial infarction (MI) in patients with pulmonary edema. Patients whose congestion is precipitated by MI would require more scrupulous care.

We have reviewed the literature on the incidence of MI in pulmonary edema. Four studies were found which showed that the incidence ranges between 29 percent and 45 percent.<sup>1-4</sup> We undertook the following prospective, uncontrolled study to determine the relationship between the frequency of MI and the factors influencing its occurrence in patients presenting with pulmonary edema.

## Methods

A total of forty-four consecutive patients who met the criteria for pulmonary edema were admitted to the ICU between October 1, 1989 and March 15, 1990. These patients had clinical evidence of pulmonary edema which was confirmed by physical examination and chest x-ray. From the patients' medical records we extracted information regarding their age, sex, presenting complaints, past history of congestive heart failure (CHF), past history of pulmonary edema, and past history of MI. The patients were followed throughout their hospital course for elevations of creatine phosphokinase (CPK)-MB isoenzymes and for electrocardiogram (EKG) changes to establish a diagnosis of MI. Patients were also followed for in-hospital survival. Results were analyzed by the chi-square method.

## Results

The overall incidence of MI among the study patients was 48

---

*A prospective study of forty-four consecutive patients admitted to the ICU/CCU with pulmonary edema found a 48 percent overall incidence of myocardial infarction.*

---

percent. The average age of the patients was 68.9 years. We divided the patients into two groups: Those over seventy years of age and those seventy years of age or younger. Fifty-three percent of the patients were over seventy years of age and 47 percent were seventy years of age or below. The incidence of MI among those patients over seventy years of age was 76 percent compared to 24 percent in the younger group.

Of the forty-four patients in the study, 43 percent were male and 57 percent were female. Sixty-eight percent of the males who presented with pulmonary edema were subsequently found to have had an MI.

Dyspnea was the chief complaint in 96 percent of the study patients and the chief complaint of every patient who subsequently was found to have had an MI. Chest pain and dyspnea were the chief complaints in the remaining 4 percent, none of whom were found to have had an MI.

Fifty-three percent of the patients had a history of pulmonary edema and/or MI. Of these, 57 percent suffered a new MI. Forty-one percent of the patients had a history of CHF, and 43 percent were found to have had an MI.

The total mortality during hospitalization was 14 percent. The mortality among patients who were found to have had an MI was 24 percent. The mortality in males was higher than in females (67 percent v 33 percent). Five of the six patients (83 percent) that died had an MI.

## Discussion

Our study differs from other studies in that we concentrated on the incidence of MI and the factors influencing the occurrence of MI in pulmonary edema. Other studies looked into the prognostic factors,<sup>1</sup> cir-

cadian variation in the frequency of MI,<sup>2</sup> and death in pulmonary edema.<sup>3</sup>

The incidence of MI in 48 percent of our study patients was similar to the study by Plotnick et al.<sup>2</sup> In contrast, a study by Goldberg et al<sup>1</sup> showed an incidence of 29 percent, while a study by Barash et al<sup>4</sup> found an incidence of 36 percent.

The 24 percent mortality among our study patients was higher than the 16 percent mortality in studies by Goldberg et al<sup>1</sup> and Plotnick et al.<sup>2</sup> Our finding that the mortality among male patients was higher than female patients (67 percent v 33 percent) contrasted with the finding by Goldberg et al that the mortality was the same in both sexes.<sup>1</sup>

Three of our findings were statistically significant: (1) MI occurred more frequently in pulmonary edema patients over seventy years of age; (2) MI occurred more frequently in male patients with pulmonary edema; and (3) MI occurred more frequently among pulmonary edema patients with a past medical history of pulmonary edema or MI. Although these findings identify subgroups of pulmonary edema patients who are at high risk, the overall high incidence of MI in our study patients underscores the critical condition of all patients who present with pulmonary edema. They are patients who require and deserve scrupulous care and close monitoring in an intensive care unit, regardless of how quickly they become clinically stabilized.

# Peripartum Cardiomyopathy: A Case Study

---

Eli B. Alegado MD and Joseph T. Mardelli MD

---

*Dr. Alegado is a member of the house staff and Dr. Mardelli is an attending physician in the Division of Cardiology at Harbor Hospital Center, Baltimore, MD.*

---

*Although the diagnosis of peripartum/postpartum cardiomyopathy is uncommon, immunosuppressive therapy appears to be a safe and effective treatment.*

---

**P**eripartum cardiomyopathy is a primary myocardial disease that develops during pregnancy or in the first five months after pregnancy. The presenting signs and symptoms are those of congestive heart failure (CHF) and more specifically, left ventricular failure. Evidence of cardiomegaly is almost always present when clinical and radiologic findings are analyzed. On endomyocardial biopsy, histological features indistinguishable from other forms of dilated cardiomyopathy include muscle fiber degeneration, interstitial edema, focal areas of fibrosis, and scattered interstitial and perivascular infiltration by mononuclear inflammatory cells.<sup>1-2</sup>

Three elements are necessary to establish the diagnosis: (1) occurrence during the last gestation and the first few months postpartum; (2) no previous history of heart disease; and (3) exclusion of known causes of cardiomyopathy (i.e., viral infections, nutritional deficiencies, small coronary vessel abnormalities, hormonal changes, and immunologic responses to fetal and myometrial antigens).<sup>3,4</sup> Patients with twin pregnancy seem to be more at risk of developing peripartum and postpartum cardiomyopathy (7 to 10 percent of the published cases).<sup>3</sup>

## Case Presentation

A twenty-seven-year-old female (gravida I, para 0, abortion 0), thirty-seven week gestational age with twin pregnancy, presented at Harbor Hospital Center with shortness of breath, orthopnea, and ankle-swelling of two-week duration.

She was taken to the delivery room where the first baby was vaginally delivered. A cesarean section was performed for the second baby because of breech presentation. Postnatally, she continued to have shortness of breath, paroxysmal nocturnal dyspnea, and increasing ankle-swelling. She was then noted to have moderate hypertension and proteinuria. There was no history of any serious illnesses since childhood. She did not drink or smoke, and was not taking any medications. Her family history was positive for hypertension.

She was a well-developed, well-nourished young woman, in acute respiratory distress. Vital signs were: blood pressure 144/112 mm Hg, pulse rate 104, and respiratory rate 30. She had a raised jugular

venous pressure to 10 cm, an enlarged heart, summation gallop, and a murmur of mitral regurgitation. Chest examination showed bilateral crackles and wheezing. There was bilateral 2+ ankle-edema.

Routine laboratory results showed normochromic, normocytic anemia with an hematocrit of 21.4. Total protein was 3.9, albumin was 2.3, alkaline phosphate was 238, and lactate dehydrogenase (LDH) was 457. Chest x-ray (Figure 1) showed cardiomegaly and pulmonary edema. Electrocardiogram showed sinus tachycardia and nonspecific T-wave abnormalities. Echocardiogram confirmed cardiac dilatation and poor ventricular function, and a large amount of pleural effusion.

The patient was transfused with two units of packed red blood cells (PRBC) to correct the anemia but developed worsening CHF. She was treated with oxygenation, fluid restriction, diuretics, digoxin, and was placed on an angiotensin converting enzyme (ACE) inhibitor. Over the next few days, the patient's course was marked by clinical improvement. She was then transferred to Johns Hopkins Hospital for endomyocardial biopsy. Biopsy samples were taken from multiple sites in the right ventricle on July 22, 1988. Histologic examination of cardiac tissues (Figure 2) showed perivascular and interstitial mononuclear cell infiltrates with occasional eosinophil and myocyte necrosis consistent with myocarditis. A multiple-gated-image acquisition analysis (MUGA) showed moderate to marked left ventricular dysfunction at rest with moderate dilatation. The patient was immediately begun on prednisone, 40 mg daily, and azathioprine, 75 mg daily, for four months. A repeat endomyocardial biopsy performed on September 15, 1988 showed almost complete disappearance of inflammatory infiltration. MUGA showed normal global biventricular function. There was biventricular dilatation and relative hypokinesia in the left ventricle, representing changes secondary to cardiomyopathy. The patient is currently maintained on prednisone and azathioprine to prevent heart failure, and is being followed up as an outpatient.

**Figure 1.** Chest x-ray shows cardiomegaly and pulmonary edema.

## Discussion

Although the diagnosis of peripartum/postpartum cardiomyopathy is not new, it remains uncommon, representing less than 1 percent of cardiovascular problems associated with pregnancy.<sup>5</sup> Clinical findings and endomyocardial biopsy suggested that myocarditis was the cause of the symptoms in this patient. Immunosuppressive treatment with prednisone and azathioprine led to dramatic clinical improvements. However, her echocardiogram showed some decreased ventricular contractility at three to four months follow-up. The patient was treated with prednisone for an additional few months. After a two-year follow-up period, there were no cardiac symptoms and the patient remains in excellent clinical condition. She was advised against future pregnancy. Medei et al<sup>4</sup> noted that immunosuppressive therapy appears to be a safe and effective treatment when peripartum myocarditis and cardiomyopathy are present.

Even though this patient had hypertension at one time, it is difficult to incriminate hypertension as a causative factor since it is absent in more than 25 percent of reported cases surveyed, and is poorly documented in some reports.<sup>6</sup>

# WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, P.I.E. Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality.

P.I.E. Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

**Physician Managing Boards**, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

#### **Quality Rated Insurance**

**Program:** a modified claims-made plan which works in the physician's favor to reward loss-free physicians

and provides added protection not available in other policies.

**A Financially Sound Reinsurance Program** with Lloyd's of London, the world's most prestigious reinsurer.

**An Aggressive Defense Team**, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

# YOCON® YOHIMBINE HCl

**Description:** Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubiaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

**Action:** Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

**Indications:** Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

**Contraindications:** Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

**Warning:** Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

**Adverse Reactions:** Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.<sup>1,2</sup> Also dizziness, headache, skin flushing reported when used orally.<sup>1,3</sup>

**Dosage and Administration:** Experimental dosage reported in treatment of erectile impotence.<sup>1,3,4</sup> 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.<sup>3</sup>

**How Supplied:** Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

# Rupture of the Spleen in Non-Hodgkin's Lymphoma: A Case Study

---

Carlos A. Conrado MD

---

*Dr. Conrado is a member of the house staff at Harbor Hospital Center, Baltimore, MD.*

**S**plenomegaly is common in lymphoma. However, it is unusual, if not rare, for this condition to progress to pathologic rupture of the spleen. We report on a patient who earlier experienced a life-threatening splenic rupture, secondary to his underlying non-Hodgkin's lymphoma.

---

*Prompt recognition and emergency surgery of pathological rupture of the spleen are necessary in patients with non-Hodgkin's lymphoma.*

---

## Case Presentation

A seventy-two-year-old male with a past medical history of chronic atrial fibrillation, chronic obstructive pulmonary disease, and gout was seen in the emergency room (ER) in August 1985, complaining of sharp abdominal pain of one day's duration. He had been referred by his private physician for evaluation of a possible intestinal obstruction.

The patient had been experiencing intermittent abdominal pain for two months prior to admission. On the night before admission, he developed a constant, sharp mid-abdominal pain. He presented to the ER in stable condition with a tender, distended abdomen, no bowel sounds, a white blood count of 15,000, and an abdominal x-ray showing probable splenic enlargement.

He was admitted for observation and started on intravenous fluids and antibiotics. His symptoms progressively worsened during the night, and he was scheduled for an emergency laparotomy the following morning. During the surgical procedure, the patient was found to have a ruptured spleen with nodular infiltrations. Examination of the biopsied specimen revealed an enlarged spleen weighing 1,950 grams (normal: 100-225 grams) with massive infiltration by follicular lymphoma, small cleaved cell type (nodular, poorly-differentiated lymphocytic lymphoma). The liver had several nodules as well.

A splenectomy was performed. Post-surgically, the patient's clinical course was complicated by anemia, mild congestive heart failure (CHF), transient mental-status changes, and an erythematous, pustular skin lesion thought to be viral in nature. During the remainder of the patient's stay in the hospital, his clinical status improved and he was discharged. He was to be followed up by the oncology service. In order to recapitulate the

medical history known to us prior to his presentation with splenic rupture and to understand the progression of his disease to this condition, it is appropriate to recount the diagnostic findings from previous medical procedures beginning in 1985.

On March 2, 1985, biopsies of two enlarged neck lymph nodes were obtained -- one from each side. The right node showed reactive hyperplasia and the left node revealed mild follicular hyperplasia. On July 7,

1987, a computed tomography (CT) scan of the abdomen and pelvis showed periaortic and pericaval lymphadenopathy. The spleen was not enlarged.

On May 9, 1988, an excisional biopsy of the lymph node on the left side of the neck revealed reactive hyperplasia with a population of mature monotonous lymphoid elements. On May 16, 1988, a CT scan of the chest revealed adenopathy in the middle mediastinum and slight adenopathy in the superior mediastinum. A CT scan of the abdomen revealed multiple areas of adenopathy in the periaortic and pericaval regions extending toward the mesentery. Again, the spleen was not enlarged. Post-splenectomy, a CT scan of the thorax, abdomen, and pelvis revealed progression of the lymphadenopathy. A bone marrow aspirate showed scattered lymphoid elements and plasma cells. The biopsy revealed paratrabeular, hypercellular forms with artifacts highly suspicious for lymphoma.

### Discussion

Lymphoma is a malignancy of lymphoid tissue characterized by the proliferation or accumulation of cells native to lymphoid tissue. A distinction is made between Hodgkin's disease and non-Hodgkin's lymphoma (NHL). Although both have their origin in lymphoid tissue, Hodgkin's disease has the distinctive morphologic features of the Reed-Sternberg giant cell.

NHL usually arises in lymph nodes (60 percent of cases), as well as in the lymphoid tissue of parenchymal organs (40 percent). All variants have the potential for spread to other lymph nodes and into various tissues throughout the body. During the course of the disease, the cervical lymph nodes are the initial site of involvement in about 40 percent of cases. As the disease advances, there is involvement of the liver, spleen, and other viscera.

Splenic enlargement is a common finding in leukemia and lymphoma, but pathologic rupture is an unusual event. Only a few cases have been reported to date.<sup>1-3</sup> It was Knoblich in 1966 who first described the phenomenon in lymphoma.<sup>4</sup> Three mechanisms are believed to be responsible for spontaneous rupture: 1) defects in blood coagulability; 2) capsular distention by infiltration of the malignant process; and 3) infarction.<sup>5,6</sup> Prompt recognition and emergency surgery are necessary for patient survival.

# PRELIMINARY SCHEDULE

May 1991

## American Medicine Today: Perspectives from Maryland

8

- Wednesday
- 8:00 a.m. - Registration
  - 8:30 a.m. - Council Meeting
  - 9:00 a.m. - 5:30 p.m. - **Scientific Sessions** -
    - "Guidelines for Accreditation of CME in Maryland" Workshop ■ "MHA Quality Indicator Project" ■ "Current Progress in Vascular Diagnosis and Therapy" ■ "What Can Computers Do for Physicians?" ■ "Access to Early Cardiac Care - The Missing Strategy"
  - 9:30 a.m. - House of Delegates Meeting followed by General Membership Meeting
  - 12:00 noon - Auxiliary Luncheons
  - 1:30 p.m. - **Plenary Session** - Elizabeth Dole, President American Red Cross
  - 2:00 p.m. - Business Meeting
  - 3:15 p.m. - Exhibitors' Sweepstakes Drawing
  - 6:30 p.m. - Exhibitors' Reception (casual attire)
  - 6:30 p.m. - Evening Entertainment - Women in Medicine Reception followed by *The Capitol Steps*, Washington's Favorite Political Cabaret Troupe

9

- Thursday
- 7:00 a.m. - Prayer Breakfast - Rev. Joseph A. Sellinger, S.J., President, Loyola College of Md.
  - 8:00 a.m. - Registration
  - 9:00 a.m. - Auxiliary Annual Meeting
  - 9:00 a.m. - 5:30 p.m. - **Scientific Sessions**
    - "Managing Diabetes in the 1990s" ■ "Recent Advances in Cardiology" ■ "Astigmatism in Single Stitch vs. Multi Stitch Surgery" ■ "How to Help Your Pregnant Patients Stop Smoking" ■ "Current Treatment of Anxiety and Insomnia" ■ "Ophthalmologic and Dermatologic Aspects of STD" ■ "HIV Today: Transmission, Testing and Treatment" ■ "Treatment of Outpatient Infections" ■ "The Right to Die in Maryland: 1991 (After Cruzan)" ■ "What About Cholesterol In Children" ■ "Problems of the Upper Extremities in Musicians" ■ Maryland Asthma Society Lecture - William Pierson, M.D. ■ "Primary Care of the HIV Positive Patient" ■ "Treatment of Chronic Pain in Patients with Advanced Cancer"
  - 12:30 p.m. - Auxiliary AMA-ERF Auction/Luncheon
  - 3:15 p.m. - Exhibitors' Sweepstakes Drawing
  - 2:00 p.m. - **Plenary Session** - Marilyn Quayle, National Breast Cancer Spokesperson; John Tupper, M.D., President AMA
  - Reception - Dinner

10

Friday

- 8:00 a.m. - Registration
- 9:00 a.m. - 5:30 p.m. - **Scientific Sessions**
  - "Diagnosis and Current Treatment of Multiple Sclerosis" ■ "Current Issues in Rheumatology" ■ "Charting a Course for the 90s - Medical Records Seminar" ■ "Current Concepts in the Care of Patients with Inflammatory Bowel Disease" ■ "G.I. Disorders Among the Elderly; Prevention of NASID-Induced Ulcers" ■ "New Concepts in the Treatment of Hypertension" ■ "Current Concepts in the Care of Patients with IBD" ■ "Technical, Ethical, and Legal Aspects of Surgery without Blood Products" ■ Harry M. Robinson, Jr. M.D. Lecture in Dermatology ■ "Legislative Initiatives Impacting Emergency M.D.'s" (ACEP) ■ Maryland Society of Physical Medicine & Rehabilitation
- 2:00 p.m. - House of Delegates Meeting followed by Council Meeting
- 7:00 p.m. - Annual Presidential Banquet - Honoring Reynaldo L. Lee-Llacer, M.D. (Reservation required - Black Tie optional)

## Auxiliary

### The Auxiliary to the Medical and Chirurgical Faculty of Maryland: 1990-1991

The American Medical Association's (AMA's) Women's Auxiliary was organized in 1922 as the logical outgrowth of state and county auxiliaries already in existence in six states, including Texas, South Dakota, Oklahoma, Maine, Minnesota, and Montana. By 1949, the AMA was anxious to have auxiliaries in all states to help oppose legislative tendencies toward the socialization of medicine. The original purpose of the Women's Auxiliary was to serve as a liaison between the medical profession and the general public. When requested to do so, or whenever the opportunity presented itself, auxiliary members were to be prepared to explain the position of organized medicine.

In September of 1949, The Medical and Chirurgical Faculty of the State of Maryland resolved at its Semi-annual Meeting in Chestertown to form a state

women's auxiliary. On November 15, 1949, the organizational meeting of Med Chi's Women's Auxiliary was held at the Faculty Building, at which time the Bylaws were adopted. Sixteen of Maryland's twenty-four counties were represented.

In 1985, during the tenure of President Mildred Taylor, the name of the Maryland Women's Auxiliary was changed; the word "Women's" was eliminated. Increasing numbers of female physicians have become Med Chi members; as their spouses began to join the Auxiliary, the old name was no longer appropriate. The name, "The Auxiliary to the Medical and Chirurgical Faculty of Maryland," more appropriately reflects the existing make-up of the Auxiliary, and illustrates some of the dramatic changes that have occurred in medicine in recent years. ■

# Where there's smoke...there may be bronchitis

"Recent research has delineated early, more subtle changes in lung and immune functions. These alterations directly predispose smokers to respiratory tract infection."

*Am Fam Phys* 1987;36:133-140

**Cecilor<sup>®</sup>**  
Pulvules<sup>®</sup> 250 mg  
**cefactor**

**Established therapy  
for today's patients**

For respiratory tract infections due to  
susceptible strains of indicated organisms

#### Brief Summary.

Consult the package literature for prescribing information. Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A  $\beta$ -hemolytic streptococci).

Contraindication: Known allergy to cephalosporins.

Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

#### Precautions:

- Discontinue Cecilor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of non-susceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Cecilor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Cecilor penetrates mother's milk. Exercise caution in prescribing for these patients.

#### Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Hypersensitivity reactions have been reported in about 1.5% of patients and include morbilliform eruptions (1 in 100). Pruritus, urticaria, and positive Coombs' tests each occur in less than 1 in 200 patients. Cases of serum-sickness-like reactions have been reported with the use of Cecilor. These are characterized by findings of erythema multiforme, rashes, and other skin manifestations accompanied by arthritis/arthralgia, with or without fever, and differ from classic serum sickness in that there is infrequently associated lymphadenopathy and proteinuria, no circulating immune complexes, and no evidence to date of sequelae of the reaction. While further investigation is ongoing, serum-sickness-like reactions appear to be due to hypersensitivity and more often occur during or following a second (or subsequent) course of therapy with Cecilor. Such reactions have been reported more frequently in children than in adults with an overall occurrence ranging from 1 in 200 (0.5%) in one focused trial to 2 in 8,346 (0.024%) in overall clinical trials (with an incidence in children in clinical trials of 0.055%) to 1 in 38,000 (0.003%) in spontaneous event reports. Signs and symptoms usually occur a few days after initiation of therapy and subside within a few days after cessation of therapy; occasionally these reactions have resulted in hospitalization, usually of short duration (median hospitalization = two to three days, based on postmarketing surveillance studies). In those requiring hospitalization, the symptoms have ranged from mild to severe at the time of admission with more of the severe reactions occurring in children. Antihistamines and glucocorticoids appear to enhance resolution of the signs and symptoms. No serious sequelae have been reported.
- Stevens-Johnson syndrome, toxic epidermal necrolysis,

and anaphylaxis have been reported rarely. Anaphylaxis may be more common in patients with a history of penicillin allergy.

- Gastrointestinal (mostly diarrhea): 2.5%
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1% and, rarely, thrombocytopenia and reversible interstitial nephritis.

#### Abnormalities in laboratory results of uncertain etiology.

- Slight elevations in hepatic enzymes.
- Transient lymphocytosis, leukopenia, and, rarely, hemolytic anemia and reversible neutropenia.
- Rare reports of increased prothrombin time with or without clinical bleeding in patients receiving Cecilor and Coumadin concomitantly.
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinistest<sup>®</sup> tablets but not with Tes-Tape<sup>®</sup> (glucose enzymatic test strip, Lilly).

## HARD NEWS: Issues & Answers in Medical Reporting

AMA's Eleventh Annual Health Reporting Conference  
Washington, D.C. • April 18-21, 1991

If you are a medical communicator wishing to sharpen your skills, plan to attend the AMA's Eleventh Annual Health Reporting Conference, Thursday, April 18 through Sunday, April 21, 1991 in Washington, D.C.

This is a unique conference designed for medical reporters, physician broadcasters and medical spokespeople. The conference features a combination of skills development courses in broadcast writing, interviewing, editing and production, plus opportunities to have your tapes critiqued by experts. Network with the pros and learn valuable tips on breaking into the business, developing the skills and dealing with the issues confronting medical broadcasters today.

Faculty includes experienced physician broadcasters, network producers, broadcast consultants, writers, editors, producers and professional speakers trainers.

	Until February 15, 1991	February 16 and beyond*
<b>Fees:</b>		
AMA Member	\$650	\$715
Non-Member	\$825	\$900
Students/Residents	\$250	\$275
Optional Day	\$275	(not available after 2/15 cut-off)
Individual Coaching Sessions	\$ 60	\$ 75

Course tracks are offered in Speakers Training, and Broadcasting (Introductory, Intermediate and Advanced). Electives are open to all participants. Complete registration information is available by calling 312/464-5102.

Fee includes Welcome Reception, April 18, 6:30 p.m., continental breakfasts, luncheons, video and audiotapes, workshops and materials. Please make check payable to the American Medical Association. We will confirm your registration by mail.

\*Registration will be accepted only on a space available basis after the February 15, 1991 cut-off date.

Register by phone or mail. Please register by February 15, 1991. This conference offers small classes, and the AMA cannot guarantee appropriate level placement after the registration cut-off date. To register, complete and return this form and mail in an envelope with your registration fee to:

### Legal and Ethical Concerns of Your Medical Practice

*This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation, and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the State. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIII, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.*

### Physician Participation in Medical Review Activities - Immunity and Legal Defense

**R**eview activities undertaken by various public and private organizations seeking to monitor and improve the performance of health care providers are universally recognized as critical efforts to assure quality health care. Physician participation in these review activities is central to the effectiveness of these activities. However, in the medical community, there is apparently great uncertainty regarding liability of physician participants and the protection of information from disclosure.

Recognizing the need to enact protections in this area, the Maryland General Assembly has enacted a series of statutes providing immunity for those involved in the process and assuring confidentiality of records and information. This article outlines the protections established by law and addresses a related issue: who will represent a physician should his or her actions be challenged or disclosure of records be sought?

#### Purposes of Review Activities

There are three contexts in which medical review occurs. First, the Maryland State Government, acting through the Board of Physician Quality Assurance (BPQA), has established procedures for reviewing the practices of physicians and taking disciplinary actions against a physician's license for incompetence or improper acts. The Medical Practice Act requires that the BPQA refer "any allegation involving standards of medical care" or questions of gross and willful overcharging to a medical society for review by physician peers.<sup>1</sup> Second, hospitals and other health care organizations conduct utilization review, quality assurance, risk management, and credentialing reviews to assure that providers acting under their auspices are doing so properly.<sup>2</sup> Third, professional associations such as the Medical and Chirurgical Faculty of Maryland (Med Chi) and local medical societies have established committees to review and resolve reports and complaints regarding individual practitioners.

In each setting, the purpose of review is to assure quality of care by monitoring the actions of prac-

tioners. In addition, review activities work for the welfare of the physician community by offering opportunities to (1) avoid the loss of professional livelihood through early identification of problems and early intervention, (2) increase awareness of practice standards, (3) provide education focused on identified areas of weakness, and (4) provide or initiate treatment for mental, emotional, or substance abuse problems.

Physician participation in review activities is critical, especially in the licensing and disciplining of physicians. Medical expertise is needed to determine violations of standards of practice and to recommend appropriate action based on medical knowledge and practical experience. The peer review committee structure assures that no single person is able to impose a personal determination of standards of care. Instead, peer reviewers develop a consensus as to whether a standard was violated. Physician participation in peer review activities, therefore, is preferable to the alternative of having a State employee (even a physician) investigate violations of care and recommend appropriate disciplinary action.

#### Protecting the Review Process

Assuring effective review programs requires that participants feel free to express their expert opinions without fear that their candor will be used against them. This requires that records and reports be maintained in strict confidence and that participants be shielded from frivolous lawsuits. As long as participants act fairly and impartially, they should not be forced to justify their actions in court. To protect medical review programs, the State has enacted several statutes providing for participant immunity and prohibiting disclosure of records or information. These laws are intended to insure the privacy of peer review deliberations in order to prevent the chilling effects liability to lawsuit could have on the actions, discussions, and decisions of participants. These laws are also intended to assure confidentiality in treatment, since disclosure would be an impediment to impaired physicians seeking needed help. The protections

available to participants and their records vary according to the setting in which the review activity takes place.

### **Review Activities Delegated by the Board of Physician Quality Assurance**

As indicated above, the BPQA is required to refer certain matters to the Med Chi Faculty or to local medical societies for review. Under procedures developed jointly by Med Chi and the BPQA, matters referred by the BPQA are handled through the Peer Review Management Committee of Med Chi, which distributes them to local medical societies or Med Chi committees. The Med Chi groups generally handling these matters are the Peer Review Committee, the Committee on Drugs, and the Physician/Patient Relations Committee. Physicians in appropriate specialties review the charts and/or the practice of the physician involved, prepare reports of their findings, and make recommendations. The appropriate committee then reviews the reports, and makes recommendations to the BPQA through the Peer Review Management Committee.

In addition, the BPQA has the authority to order a physician to undergo an examination<sup>3</sup> which may be conducted by the Physician Rehabilitation Program of Med Chi. "Physician Rehab" may also become involved in delegated functions of the BPQA after disciplinary action has been taken against a physician's license. The BPQA may issue an order, either after a hearing process or by consent, that places the physician on probation. As part of the physician's probation, he or she may be required to undergo monitoring, education, or treatment under the auspices of the Physician Rehabilitation Program.

Maryland law provides that a person making a complaint to the BPQA is immune from civil liability, as long as he or she acts without malice.<sup>4</sup> In addition, a person who participates in the investigation, deliberations, or decisions of this process is immune from suit as well.<sup>5</sup> An individual performing functions under the auspices of the BPQA will be defended by the State Attorney General's office, as long as his or her actions are within the scope of the duties of the BPQA and he or she acts without malice.<sup>6,7</sup> These two conditions may imply a significant restriction on State legal representation. However they actually reflect the requirement that disciplinary proceedings adhere to basic principles of fairness to license holders.

The law prohibits the government from depriving an individual of life, liberty, or property without due process of law.<sup>8</sup> Maryland's Administrative Procedure Act sets forth minimum requirements for notice and an opportunity for a hearing, before action may be taken against a license of a physician or other individual.<sup>9</sup> In turn, the BPQA has established investigative and hearing procedures that must be followed.<sup>10</sup> In general, a participant in the review

process, whether a BPQA employee or a volunteer working through Med Chi, will be considered as operating within the scope of the authority of the BPQA as long as he or she acts in conformity with the procedures established for the process.

Fairness also requires that participants act without malice. To be lawful, disciplinary actions must be based on articulable, objective criteria and not on improper motives. Improper actions would include actions based on personal bias or economic consideration, such as an intention to interfere with contracts or to limit competition. Where a participating physician acts to harm another physician's practice for personal or economic reasons, the Attorney General's office is unlikely to defend that physician.

Documents and information relating to BPQA-delegated responsibilities are also protected under Maryland law. "Except by the express stipulation and consent of all parties . . . , in a civil or criminal action . . . the proceedings, records, or files of the Board [BPQA] or any of its investigatory bodies are not discoverable and are not admissible in evidence."<sup>11</sup> Furthermore, "the Board [BPQA] or any of its investigatory bodies may not disclose any information contained in a record" of the BPQA.<sup>12</sup>

### **Review Activities by Health Care Organizations**

In addition to medical review committees of the State and its agents, privately owned health care organizations conduct reviews of practitioners operating under their auspices. Maryland law has also provided immunities for what it defines as a "medical review committee" which includes a "risk management, credentialing or utilization review committee . . . of a hospital, related institution" or health maintenance organization, preferred provider organization, independent practice association, or community health center.<sup>13</sup> Under the law, there is immunity "for any action as a member of the medical review committee or for giving information to, participating in or contributing to the function of the medical review committee,"<sup>14</sup> as long as the person "acts in good faith and within the scope of the jurisdiction of a medical review committee."<sup>15</sup> In addition to immunity for participants, records and files "are not discoverable and are not admissible in evidence in any civil action arising out of matters that are being reviewed and evaluated by the medical review committee."<sup>16</sup> Should a medical review committee participant be sued, the hospital or other health organization should provide legal defense. The facility should also provide legal counsel opposing any attempt to discover or use the medical review committee information in any court proceeding.

### **Activities of the Faculty and Local Medical Societies**

Med Chi and local medical societies must refer to the BPQA any complaint setting forth "allegations of

grounds for disciplinary action" under the law.<sup>17</sup> While a review must be delegated by the BPQA to be defended by the Attorney General, these societies may conduct reviews of other medical matters as well. The immunity laws pertaining to medical review committees also pertain to a "committee of the Faculty or any of its component societies or a committee of any other professional society or association composed of providers of health care" when that committee engages in activities to evaluate and improve the quality of health care.<sup>18</sup> Records and files of Med Chi committees are also protected to the same extent as other medical review committee information. In fact, the law provides additional protections for "any record and other information obtained by the Faculty, component society of the Faculty . . . if that record or information identifies any person" and "any record of a proceeding or transaction before the Faculty or one of its committees that relates to an investigation or report . . . as to an allegation of grounds for disciplinary or other action."<sup>19</sup> Such information may not be used in any proceeding.<sup>20</sup> Additional protections are provided for "giving information to any hospital, hospital medical staff, related institution, or other health care facility, alternative health system, professional society, medical school, or professional licensing board."<sup>21</sup>

It is clear that a physician participating in a review activity sponsored by the Faculty, whether or not under the auspices of the BPQA, is granted immunity from suit and has his or her information protected from disclosure. Where the review activity is not conducted under the auspices of the BPQA, or where the BPQA has determined that the participant has acted outside the scope of his BPQA duties, legal representation in the event of a suit will not come from the Attorney General's office. In that event, the participant should look to his or her own liability insurance carrier for assistance. For example, Medical Mutual Liability Insurance Society of Maryland (Med Mutual) has confirmed that physicians are covered under its policies for review activities. According to Med Mutual, coverage is provided for "professional services" which include "service as a member of a formal accreditation, disciplinary, standards review, or similar professional board or committee."<sup>22</sup> Because the records or files of review activities belong to Med Chi or the local society, the Faculty or society will need to respond to any attempt to discover or use information from review activities in court proceedings.

### Conclusion

As seen here, extensive protections exist for the physician who participates in medical review activities. If acting within the authority of the physician licensing agency, he or she is immune from suit and will be defended by the Attorney General, as long as he or she has acted without malice. The BPQA, through the Attorney General, will also protect review information from disclosure.

A physician conducting quality assurance, credentialing, or other medical review for a hospital or other organized health care provider is also immune. The facility will defend the physician from any suit and will act to maintain the confidentiality of review records.

A physician who participates in review activities for Med Chi or a local medical society is also immune and should be defended by his or her own professional liability carrier. Med Chi will intervene when any request for records is made, in order to prevent disclosure of records or information in court proceedings.

## Word Rounds

---

### "Say Something in Medicine for Us"

Three weeks into my freshman year in medical school, my mother had the entire family over for brunch. Proudly she turned to her only child and in the most accomplished stage whisper said: "Say something in medicine for us." My cheeks flaming, I controlled the vitriolic urge to respond by naming some indelicate perineal organ. Instead, entirely out of character, I reticently stammered some self-conscious apology and demurred.

Of course there had been a jot of humor in my mother's request. And more than an iota of implicit truth. The truth was that our fraternity does speak a foreign tongue. We converse in an idiom filled with scientific Greek and Latin roots, sobriquets, eponyms, acronyms, and other diminutives all peculiar to our professional brotherhood. It is an exotic jargon - scholarly and precise - but often alien to other members of society, and filled with elements of enchantment, dread, and mystery.

In fact, it often is alien to us -- its speakers. As medical neophytes, we are unceremoniously dumped into a unique world without a clue about its history or the origin of its terminology. The truth of a word (Greek: *etymon*) is implied by its **etymology**. Word histories - the derivation of terms - tells us something about what words mean and how they got to mean it. In this column, as it appears from time to time, I will share with you some of those truths which have delighted and stimulated me -- the eccentricities of our medical dialect.

Anatomy is a good place to start. The **mastoid**, that smooth, spherical outcropping of the temporal bone located behind the ear, got its name from some extremely imaginative, if somewhat lecherous, ancient prosector. He thought it looked like a tiny breast (Greek: *mastos* - "breast" + *oides* - "like").

The **duodenum** was named for its length. It was roughly twelve finger-widths long (Latin: *duodecim* - "twelve"). Which, in turn, is from *duo* - "two" + *decem* - "ten". **December** was the tenth month of the Roman calendar, just as **September** was seventh, **October** was eighth, and **November** ninth. Julius and Augustus Caesar, in a frenzy of narcissism, borrowed some days from the others and stuffed two months in between June and September, thus totally obscuring the etymology of the last four months of each year.

**Arteries** are also erroneously named. The word stems from the Greek *arteria* which originates from *aer* - "air" + *tereo* - "to keep." That is, something which holds air or acts as an air duct. At necropsy, arteries are ordinarily found to be empty. To the early anatomists they appeared to carry air, and were thus named. The **jejunum** was also found to be empty during most dissections. Thus, Latin: *jejunus* - "empty" or "hungry." (Do you remember Woody Allen's delicious, droll pomposity in *Annie Hall* - "You are so jejune!")

The names of two arteries are especially intriguing. In ancient Greece, charlatans attracted an audience by stupefying a goat with their hands. They pressed firmly on arteries within the goat's neck and it promptly fell unconscious. The Greek word *karotikos* means "to stun or render unconscious." Thus the carotid arteries were named.

The legend of the second artery begins with Galen. Born in 130 A.D. in Pergamum, Asia Minor (now Bergama, a town in western Turkey), he became physician to the gladiators in Rome. Soon his reputation spread and he became the preeminent physician in the city, attending three emperors. He was the first to recognize that arteries contained blood and, although he had never performed a dissection, his anatomic drawings were regarded as the quintessence of truth and perfection.

Fourteen-hundred years later, they were still venerated with the respect accorded divine revelation. (Medicine had its Dark Ages along with the rest of civilization.) Then Andreas Vesalius was born. He, too, studied the renowned Galen. But in Italy, where he had journeyed following graduation from Montpellier and Paris, physicians were actually performing dissections. There he had the opportunity to verify the accuracy of Galen's work, much of which was found to be flawed. Nonetheless, as Vesalius labored to complete his classic and monumental achievement on the anatomy of the human body, *De Humani Corporis Fabrica*, he used many of Galen's terms to label organs.

In Galen's drawings of the arteries arising from the arch of the aorta, one of the principal vessels had been inadvertently unlabelled. Not finding a name with which to identify that artery, Vesalius - perhaps in a jocular spirit - called it "the anonymous or unnamed" vessel. In Latin it is known as the *innominate* artery.

Of course, some anatomic structures were named, as was the **mastoid**, for their resemblance to other objects. The **coronary arteries** circle the heart like a crown, the Latin for which is *corona*. And the **mitral valve**, with its bicuspid leaflets, looked to some devout anatomist like the twin peaks of a bishop's **miter** - the tall hat worn by the Pope and his bishops. The **coccyx** reminded some prosecutor, who was an avid bird watcher, of the cuckoo's beak. The Greek word for cuckoo was *kokkyx*. The Greek word for crow is *korax* - someone else imagined that the **coracoid** process resembled its bill as well.

Then there are the eponymous structures - those which began life as proper names - only to be lowercased by history. Gabriele Fallopio initiated his career as a canon of the cathedral at Modena. Fortunately for us, he converted to medicine and became the most distinguished of the sixteenth century Italian anatomists. He was Vesalius' favorite pupil and succeeded him as Professor of Surgery and Anatomy at the University of Padua. Fallopio described the fifth,

## Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

**Physician Placement Service**  
**1211 Cathedral St., Baltimore, MD 21201-5585**  
**(301-539-0872)**

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland. **MMJ** announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

eighth, and ninth cranial nerves, the chorda tympani, the placenta, the vagina, and the cochlea of the inner ear, as well as the oviducts which bear his name - the fallopian tubes.

A contemporary and rival of Fallopio was Bartolomeo Eustachio, physician to Pope Julius III and Professor of Anatomy at the Collegio delle Sapienze in Rome. He described the adrenal glands, the sixth cranial nerve, and the thoracic duct, in addition to the tiny tubes which connect the middle ear with the pharynx. The **Eustachian tubes** were named in his honor over a century later by a man named Antonio Maria Valsalva.

Returning for a moment to the Greek word *mastos*: "breast" (as in **mastectomy**, **mastitis** and **mastoid**), I am intrigued to discover that the Greeks enjoyed two additional terms for that unique organ: *mazos* and *mamme*. The latter word was borrowed by the Romans and altered to the Latin *mammae*, from which stem **mammary** and **mammal** (animals which suckle their

young). However, insofar as I can ascertain, there exists only one word which derives from the Greek term *mazos*. That term is used to name a mythological tribe of women living in Scythia near the Black Sea. They were fierce warriors and magnificent archers who, in order to draw their bowstrings further back, cut off their right breasts. They were thus known as a "without" + *mazon* "breast" -- **Amazons**.

There is a curious twist to this etymologic history. In 1543, after participating with Pizzaro in the conquest of Peru, a Spanish explorer named Francisco de Orellana decided to explore the unknown waters of the Marañon River east of Quito. Drifting along with the current, he mapped the entire river to its mouth. Along the way, he was attacked by a fierce tribe of warriors. Orellana insisted they were muscular women who were missing one breast -- **Amazons**.

He had renamed the Marañon.

# A New Strategy to Improve Patient Care

*We help the physician  
by helping the patient  
help themselves*

**H**ealth can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

Training Programs Include:

## **Diabetes Education**

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

## **Behavior Modification**

- weight reduction and maintenance
- modified fasting: Optifast
- limited diets: Optitrim
- full food control: LEARN®
- stress management

## **Dietary Counseling**

- all medical disorders

Call for an appointment and further information or have patients schedule a general metabolic assessment at 828-3296.

# Enter the Eleventh Annual Med Chi Photo Contest

**Enter early!**

*Deadline for entries is April 19, 1991 ■  
Two categories: Black & White or Color ■  
Open to all Med Chi and Auxiliary Members*

**■ First and Second Prizes Awarded in Each Category ■ All  
Photographs will be displayed at the 1991 Annual Meeting at College Park.**

## *Med Chi Photo Contest Rules*

**Eligibility:** All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

### *Contest Rules:*

1. Photographs may be submitted in two categories: black and white or color.
2. Limit: three entries per person.
3. Prints only, no smaller than 8 X 10 or larger than 11 X 14, will be accepted. If your favorite shot is a slide, you must have a print made to enter in the contest within these size ranges.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name, address, and telephone number attached to the back of each photograph.
6. Entries may be mailed or brought to the Faculty Office, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on April 19.
7. Photographs entered in the contest will be on display at the Annual Meeting in May of 1991.
8. Prizes will be awarded to the first and second place winners. Additional information about the prizes will be published in the Journal.
9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, May 8-11, 1991.
10. Photographs will not be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual meeting at noon on May 11, or at the Faculty Building thereafter.
11. The Faculty does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

## Board of Physician Quality Assurance Actions

**In the Matter of  
Hwal Chin Chong RA  
Before the  
Maryland Board of  
Physician Quality Assurance**

**Amended Consent Order**

**B**y a Consent order dated August 16, 1989, the Board of Physician Quality Assurance (the Board) agreed to accept the surrender of Hwal Chin Chong RA (the Respondent's) registration to practice acupuncture. The Consent Order provided that Respondent could apply for reinstatement of his registration to practice acupuncture.

Respondent petitioned the Board through its Settlement Conference for reinstatement of his registration on December 5, 1990. At its meeting on December 12, 1990, the Board considered the Settlement Conference's recommendation and voted to amend its Consent Order as follows:

**Findings of Fact**

1. The Findings of Fact of the Board's Consent Order dated August 16, 1989 are incorporated by reference.

2. Respondent's registration to practice acupuncture was surrendered on August 16, 1989. Respondent has not practiced acupuncture since August 16, 1989.

3. Respondent presented the following information as to his activities since August 16, 1989:

- a. Documentation of his taking English courses;
- b. Documentation that Respondent had attended Grand Rounds at Johns Hopkins Hospital;
- c. Documentation of his taking six hours of continuing education in acupuncture; and
- d. The formulation of an agreement with Jane Younghea Lew MD, to be Respondent's supervising physician.

**Conclusions of Law**

The Board incorporates by reference the conclusions of law contained in its Consent Order of August 16, 1989 and further concludes that Respondent's registration is **SURRENDERED** and Respondent can petition the Board for reinstatement of his registration.

**Order**

By a majority vote of the full authorized membership of the Board considering this matter it is hereby this 21st day of January 1991.

**ORDERED** that the Board will not consider Respondent's petition for reinstatement of his registration until such time as Respondent submits evidence of the following:

1. Respondent has taken and passed the Test of Spoken English, with the grade of 220;
2. Respondent has developed an Informed Consent to be used with patients by the supervising physician and to which he must adhere, which has been approved by the Settlement Conference;
3. Respondent has developed a model patient record which he will use, which has been approved by the Settlement Conference; and
4. Respondent has completed all continuing education requirements for two years proceeding the time of the petition for reinstatement, such requirements being forty credits for a two-year period; and be it further

**ORDERED** that in the event that Respondent meets the conditions precedent set forth above, the Board will reinstate Respondent's registration to practice acupuncture subject to the following conditions of probation:

1. Respondent would be permitted to practice under the supervision of Dr. Lew and Respondent would sign a release permitting the Board to receive quarterly reports from Dr. Lew as to the nature of Respondent's practice, the number of patients Respondent is seeing, and the methods by which Respondent is sterilizing his acupuncture equipment;
2. Six months after Respondent returns to practice, he will be subject to practice review, the expense of which would be his responsibility. The practice review would be conducted by a reviewer appointed by the Acupuncture Advisory Council. In the event that the practice review indicated that Respondent was a danger to himself or the public, Respondent's registration could be immediately suspended without prior notice and an opportunity to be heard, provided that Respondent was given a hearing within thirty days of requesting same. The burden of proof in such a hearing would be preponderance of the evidence;
3. Respondent must take twenty additional Category 1 hours of continuing education approved by the Acupuncture Advisory Council;
4. Respondent must keep his patient records in English; and
5. If the practice review indicates Respondent is practicing competently, Respondent can petition the Board to remove all conditions of probation; and be it further

**ORDERED** that this order is considered a public document pursuant to *Maryland State Government Code Ann. §§10-611 et seq.*

*ISRAEL H. WEINER MD*, Chairperson  
Maryland Board of Physician Quality Assurance

## Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of five pages.

1. By signing this Consent, I hereby submit to this Order and its conditions.

2. I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.

3. I acknowledge that by consent to this Order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my registration to practice acupuncture in the State of Maryland.

I, Hwal Chin Chong RA, have read this Consent Order and have carefully reviewed each and every part with my attorney, Anthony P. Palaigos, Esquire. I understand it and voluntarily agree to it.

I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and the terms of the Order.

IIWAL CHIN CHONG RA

■ ■ ■

**In the Matter of  
Morton Ellin MD  
Before the  
Maryland Board of  
Physician Quality Assurance**

### Final Order

On October 14, 1988, Morton Ellin MD (Respondent) applied for Specialist Identification as an internist to the Board of Physician Quality Assurance (the Board). On June 11, 1990, the Board initially denied his application in accordance with Health Occupations Article (HO) §14-704 of the *Annotated Code of Maryland* and COMAR 10.32.09. Specifically, the Board stated that Respondent lacked sufficient training and adequate clinical experience to be identified as a specialist in Internal Medicine.

On June 20, 1990, Respondent requested a hearing on the Board's initial denial. On August 29, 1990, the hearing commenced before an Administrative Law Judge. Present at the hearing were: Respondent; Leonard Orman, Esquire, representing Respondent; Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor for the State; Daniel McCrone MD; and Samuel Friedel MD.

### Summary of Evidence

The following exhibits were introduced:

**Hearing Office Exhibit:** The Board's initial denial of Respondent's application.

The State introduced the following documents into the record:

**State Exhibit 1:** The American Board of Medical Specialties (ABMS) Table of recognized specialties, dated March 1988.

**State Exhibit 2:** Medical and Chirurgical Faculty of Maryland (Med Chi) Specialist Identification: Executive Summary.

**State Exhibit 3:** Med Chi Specialist Identification: Policy and Procedures of the Committee on Specialist Identification.

**State Exhibit 4:** Reviewer's Checklist for Physician Specialty Identification.

**State Exhibit 5:** Board of Physician Quality Assurance Evaluation Form completed by Respondent and dated October, 14, 1988.

**State Exhibit 6:** Reviewer's Checklist for Physician Specialty Identification completed by Dr. McCrone acting on Respondent's application.

**State Exhibit 7:** November 15, 1988 letter from Med Chi to the Board recommending the denial of Respondent's application for Specialty Identification.

Drs. Daniel McCrone and Samuel Friedel testified on behalf of the State. Each served on the Committee for Specialist Identification of Med Chi at the time Respondent's application for Specialist Identification was being considered.

The Respondent introduced the following documents into the record:

**Respondent Exhibit 1:** Respondent's Curriculum Vitae.

**Respondent Exhibit 2:** Baltimore County General Hospital *In Focus* publication, Volume III, Issue 1, dated Spring 1989, listing Respondent as a specialist in Internal Medicine.

**Respondent Exhibit 3:** August 27, 1990 letter from Dr. Howard H. Patt.

**Respondent Exhibit 4:** August 29, 1990 letter from Norman Zimmerman MD.

**Respondent Exhibit 5:** August 28, 1990 letter from Deepak Merchant MD.

**Respondent Exhibit 6:** August 28, 1990 letter from Arnold H. Michael MD.

**Respondent Exhibit 7:** August 28, 1990 letter from George H. Greenstein MD.

**Respondent Exhibit 8:** August 28, 1990 letter from Solomon D. Robbins MD.

**Respondent Exhibit 9:** August 28, 1990 letter from Roberto Garcia MD.

**Respondent Exhibit 10:** August 28, 1990 letter from Rodolfo C. Lota MD.

**Respondent Exhibit 11:** August 27, 1990 letter from Simon Calle MD.

**Respondent Exhibit 12:** August 28, 1990 letter from Melvin D. Kopilnick MD.

**Respondent Exhibit 13:** August 27, 1990 letter from Louis H. Tankin MD.

Respondent testified on his own behalf.

On September 6, 1990, the Administrative Law Judge issued a recommended decision including proposed Findings of Fact, Conclusions of Law, and a Recommendation. The parties were informed of their right to take exceptions. By letter dated October 12, 1990, the parties were advised that the Board would make a decision at its meeting on October 24, 1990 on

the recommended decision. The parties filed no exceptions. At the Board meeting on Wednesday, October 24, 1990, the Board voted as follows:

### Findings of Fact

On the basis of the preponderance of evidence, the Board makes the following Findings of Fact:

1. Respondent, a licensed physician in the State of Maryland, applied for Specialist Identification on October 14, 1988.

2. Internal Medicine is a specialty recognized by the ABMS.

3. If a physician is not certified by the ABMS, he/she must complete an application outlining specific training and experience in the requested specialty. The applications are referred by the Board to Med Chi's Committee on Specialist Identification (the Committee) for evaluation and recommendation to the Board.

4. The criteria utilized by the Committee encompass, *inter alia*:

- a. The extent of training in the relevant clinical area or areas;
- b. The length of time the physician has been practicing the specialty;
- c. The hospital activities and privileges as they relate to the specialty;
- d. Continuing medical education courses attended in the last five years in the applicant's area of expertise; and
- e. Recommendations for approved specialists as consultants in the applicant's area of expertise.

5. The Committee, in its Policy and Procedures of the Committee on Specialist Identification, requires that the applicant demonstrate sufficient training in the relevant clinical area, specifically:

Interpretation: ... If the applicant has not completed an accredited training program, the applicant shall meet the following contributory criteria:

- (1) Practices for sufficient time in the specialty;
- (iii) Whether the applicant adequately demonstrates that:
  1. peers refer to the physician as a consultant in the specialty field requested; or
  2. peers have promoted the physician to levels of responsibility within the specialty requested, such as hospital chief of service, department head, or officer in an appropriate specialty society.
- (2) ... maintains hospital privileges and is active in the specialty;
- (3) Maintains appropriate continuing medical education in the specialty over the past five years.

6. The Reviewer's Checklist for Physician Specialty Identification, given to the Committee member selected to review the applicant's application, does not refer to either the statutory criterion regarding a physician's having ethically held himself out as a specialist in the field prior to July 1, 1984 or the policy criteria regarding peer referral to the applicant as a consultant in the specialty field.

7. Drs. McCrone and Friedel testified that as Com-

mittee members they are not permitted to go beyond the information contained in the application in making their recommendations to the Committee.

8. Respondent's application did not contain all of the information necessary in order to make a recommendation in accordance with the statutory and regulatory requirements, nor did it contain information which Med Chi, in its policy guidelines, suggested be considered.

9. At the hearing, Respondent presented information which responded to the statutory and regulatory criteria for Specialist Identification which was not included in his application:

- a. Respondent completed one year of rotating internship at Sinai Hospital from July 1954 to July 1955.
- b. Respondent completed one year of residency at Sinai Hospital from July 1955 to July 1956: nine months in Medicine and three months in Pediatrics.
- c. Respondent practiced two years of adult Internal Medicine for the two-year period that he served as captain in the U.S. Army, from August 1956 to July 1958.
- d. Respondent served as the Chief of the Male Medicine Ward in the U.S. Army 2nd Field Hospital, Munich, Germany.
- e. Respondent's practice was limited to the diagnosis and treatment of adult males during his military service.
- f. From 1952 to 1962, Respondent served on the active staff in Internal Medicine at Lutheran Hospital in Baltimore, MD.
- g. From 1956 to the present, Respondent has been on the visiting staff in Internal Medicine in the Department of Medicine at Sinai Hospital, Baltimore, MD.
- h. From 1963 to the present, Respondent has served on the active staff in Internal Medicine in the Department of Medicine at Baltimore County General Hospital, Baltimore, MD.
- i. Respondent served as Assistant Chief of Medicine at Levindale Geriatric Home, Baltimore, MD, from 1959 to 1972.
- j. Respondent has served as Medical Director for Respiratory Therapy at Baltimore County General Hospital from 1972 to the present.
- k. As Medical Director for Respiratory Therapy at Baltimore County General Hospital, Respondent directs several staff pulmonary specialists.
- l. Respondent heads the Pulmonary Department at Baltimore County General Hospital.
- m. Respondent directs the critical care unit, which combines intensive care and coronary care, at Baltimore County General Hospital.
- n. Respondent's inpatient practice at Baltimore County General Hospital is exclusively adult Internal Medicine.
- o. Respondent has been listed as a specialist in

Internal Medicine at Baltimore County General Hospital in its publication *In Focus*.

- p. From 1963 to 1973, Respondent performed approximately 75 percent of the preoperative evaluations for patients at Baltimore County General Hospital. Preoperative evaluations are requested of internists by surgeons prior to a patient's surgery.
  - q. From 1973 to 1983, Respondent performed approximately 50 percent of the preoperative evaluations for patients at Baltimore County General Hospital.
  - r. Since 1983, Respondent has been in private practice with Dr. Garber, a Board Certified internist.
  - s. Since 1985, Respondent has taken 531 hours of continuing medical education in Internal Medicine.
  - t. Respondent regularly attends medical Grand Rounds at Johns Hopkins Hospital.
  - u. In 1957, the requirements for sitting for Board Certification in Internal Medicine were: one year of internship, one year of approved residency (nine months adequate in Internal Medicine), two years of military service medical practice in an appropriate area, and four years of medical practice (if the military medical practice was not sufficient, then eight years of medical practice was required). Respondent met those qualifications.
  - v. When Respondent was discharged from military service and began in practice, the requirements for sitting for Board Certification in Internal Medicine changed to require three years of an approved residency. As Respondent was already in practice and had financial responsibilities, he did not apply to sit for Board Certification in Internal Medicine.
  - w. In 1972, Respondent sat for Board Certification in Family Practice as he met the requirements for taking the Board Certification examination in that area through the grandfathering clause.
  - x. Respondent was Board Certified in Family Practice in 1972, and recertified in 1978 and again in 1988.
  - y. Respondent scored in the 97th percentile in the Internal Medicine portion and the 63rd percentile in the Gerontology portion of the Family Practice recertification examination in 1988.
  - z. For the past fifteen years, Respondent's medical practice has been 99 percent limited to Internal Medicine and, in the past ten years, he has not treated patients under the age of twenty-five.
  - aa. Respondent is regarded by the medical community as a specialist in Internal Medicine.
  - bb. Respondent, prior to July 1, 1984 and continuing, has ethically held himself out to be a specialist in Internal Medicine.
10. Respondent, in his application for specialist identification, referred to his practice as "general

medicine" as he did not believe that he should use the designation "internal medicine" without the benefit of specialist identification from the Board. However, he has since amended his CV to reflect Internal Medicine as the nature of his practice.

11. The Committee did not have sufficient information to make an informed determination as to whether Respondent met the criteria for specialist identification as an internist.

### Conclusions of Law

On the basis of the preponderance of the evidence presented at the hearing as detailed in the above Findings of Fact, the Board concludes that Respondent demonstrated sufficient training and adequate clinical experience to meet the criteria set forth in the statute and regulations for specialist identification.

### Order

Based upon the foregoing Findings of Fact and Conclusions of Law, it is this 27th day of November 1990, by the Board of Physician Quality Assurance

ORDERED that Morton J. Ellin MD is approved as a specialist in Internal Medicine; and be it further

ORDERED that this is a final order and as such is considered a public document pursuant to State Government Article, *Annotated Code of Maryland*, §§10-611 *et seq.*

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

**In the Matter of  
Alan Franklin Knull MD  
Before the  
Maryland Board of  
Physician Quality Assurance  
Surrender of License**

December 6, 1990

Dear Dr. Weiner and Members of the Board:

Please be advised that I have decided not to renew my license, however I have been informed that under Health Occupations Article (HO) §14-503, I can not allow my license to lapse while under investigation unless the Board agrees to accept this lapse. I have been informed that the Board did not accept this lapse, therefore I have decided to surrender my license, #D31721, which entitles me to practice medicine in the State of Maryland. I understand that the Board of Physician Quality Assurance (the Board) decided to accept my license on September 26, 1990.

My decision to surrender my license has been

prompted by an investigation by the Board. The Federation of State Medical Boards reported that the Ohio State Medical Board indefinitely suspended my license on June 16, 1989. The suspension of my license was upheld following an appeal. Based upon this information, the Board voted to charge me pursuant to HO §14-504(a)(21) with underlying grounds of HO §14-504(A)(4) and (22).

The pertinent provisions of HO §14-504(a) provide:

- (21) Is disciplined by a licensing or disciplinary authority...for an act that would be grounds for disciplinary action under this section;
- (4) Is professionally...incompetent;
- (22) Fails to meet the appropriate standards as determined by appropriate peer review for delivery of quality medical and surgical care...;

My decision to surrender my license as a physician has been prompted by my desire to have this matter resolved without formal disciplinary action. In executing this letter of surrender, I understand and agree that I can apply for reinstatement of my license. If I apply for reinstatement, I bear the burden of proving to the Board that I am competent to practice medicine. The Board may require that I take a test to evaluate my competency, such as the Special Purpose Examination. I would bear the cost of any such evaluation. In other words, I must demonstrate that I have the cognitive and clinical competence to practice medicine and have the requisite of good moral character. Additionally, I would have to fulfill any other requirements for reinstatement such as continuing education.

I understand that I may not give medical advice to any individual, for compensation or otherwise, and cannot prescribe medication in the State of Maryland. In other words, I understand that the surrender of my license means that I am in the same position as an unlicensed individual in the State of Maryland.

I understand that the Board will acknowledge to the Federation of State Medical Boards and the National Practitioner Data Bank that I have surrendered my license as a resolution of the matters pending against me. This letter of surrender is a public document.

Finally, I wish to make clear that I have had an opportunity to consult with an attorney before signing this letter SURRENDERING my license to practice medicine in Maryland. I understand this letter of surrender fully. I make this decision voluntarily and knowingly.

ALAN FRANKLIN KNULL MD

On behalf of the Board of Physician Quality Assurance, on this 28th day of December 1990, I accept Alan Franklin Knull's surrender of his license to practice medicine in Maryland pursuant to HO §14-503.

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

**In the Matter of  
Martin Meltzer MD  
Before the  
Maryland Board  
of Physician Quality Assurance  
Surrender of License**

November 28, 1990

Dear Dr. Weiner and Members of the Board:

Please be advised that I have decided to surrender my license, #D07491, which entitles me to practice medicine in the State of Maryland. I understand that the Board of Physician Quality Assurance (the Board) decided to accept my license on November 28, 1990. This decision is IRREVOCABLE.

My decision to surrender my license has been prompted by an investigation by the Board. That is, the Federation of State Medical Boards reported that I had surrendered my license in New York State while under charges for professional misconduct. Specifically, the New York Board had accepted my surrender. Based upon this information, the Board voted to charge me pursuant to Health Occupations Article (HO) §14-504(a)(1) and (25) with underlying grounds of HO §14-504 (a)(3) and (4).

The pertinent provisions of HO §14-504 (a) provide:

- (1) Fraudulently or deceptively obtains or attempts to obtain a license for the applicant...;
- (25) Was subject to investigation or disciplinary action by licensing or disciplinary authority...for an act that would be grounds for disciplinary action under this section and the licensee,
  - (i) Surrendered the license by the state or country to the state or country;
- (3) Is guilty of immoral or unprofessional conduct in the practice of medicine;
- (4) Is professionally...incompetent.

My decision to surrender my license as a physician has been prompted by my desire to have this matter resolved without formal disciplinary action.

I understand that I may not give medical advice to any individual, for compensation or otherwise, and cannot prescribe medication in the State of Maryland. In other words, I understand that the surrender of my license means that I am in the same position as an unlicensed individual in the State of Maryland.

I understand that the Board will acknowledge to the Federation of State Medical Boards and the National Practitioner Data Bank that I have surrendered my license as a resolution of the matters pending against me. This letter of surrender is a public document.

Finally, I wish to make clear that I have had an opportunity to consult with an attorney before signing this letter SURRENDERING my license to practice medicine in Maryland. I understand this letter of surrender fully. I make this decision voluntarily and knowingly.

MARTIN MELTZER MD

On behalf of the Board of Physician Quality Assurance, on this 21st day of December 1990, I accept Martin Meltzer's surrender of his license to practice medicine in Maryland pursuant to HO §14-503.

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

**In the Matter of  
Louis J. Pratt MD  
Before the  
Maryland Board of  
Physician Quality Assurance**

**Order for Reinstatement of a License**

**B**y Final Decision dated August 6, 1990, the Board of Physician Quality Assurance (the Board) voted to suspend the license of Louis J. Pratt MD (the Respondent). The Final Decision stated that prior to Respondent's petitioning for reinstatement of his license, by requesting a stay of the suspension of his license, Respondent must successfully complete a recordkeeping course approved by the Board, and surrender his Maryland Controlled Dangerous Substance permit and his Federal Drug Enforcement Administration (FDEA) registration certificate.

Respondent petitioned the Board through its Settlement Conference for reinstatement of his license on December 5, 1990. At its meeting on December 12, 1990, the Board considered the Settlement Conference's recommendation and voted to amend its Final Decision as follows:

**Findings of Fact**

1. The Findings of Fact of the Board's Final Decision dated August 6, 1990 are incorporated by reference.
2. Respondent's license was suspended on August 6, 1990.
3. Prior to petitioning the Board to stay the suspension of his license, thus reinstating Respondent's privilege to practice medicine, the Respondent was required to:
  - a. Within three months of the date of the suspension, demonstrate that Respondent successfully completed a recordkeeping course approved by the Board, Respondent bearing all expenses of this course; and
  - b. Demonstrate that Respondent had surrendered his Maryland Controlled Dangerous Substance permit and his FDEA registration certificate by executing the form provided to Respondent by the Board.
4. Respondent presented the following information at the Settlement Conference:

- a. Respondent was given a medical knowledge evaluation by Edward J. Kowalewski MD, Professor Emeritus, School of Medicine, University of Maryland at Baltimore, Department of Family Medicine on September 25, 1990;
- b. On November 6, 1990, Respondent took an intense course on office medical records from Dr. Kowalewski;
- c. By letter dated November 9, 1990, Dr. Kowalewski submitted his report and recommendation to the Board; and
- d. Respondent surrendered his Maryland Controlled Dangerous Substance permit and his FDEA registration on August 6, 1990.

5. Respondent petitioned the Board to stay the suspension of his license and permit him to practice medicine at the Social Security Administration as a medical consultant following a training program.

**Conclusions of Law**

The Board incorporates by reference the conclusions of law contained in its Final Decision of August 6, 1990 and further concludes that Respondent's license was **SUSPENDED**; and the Board further

**CONCLUDES** that Respondent successfully completed a recordkeeping course approved by the Board within three months from the date of the Final Decision; and the Board further

**CONCLUDES** that Respondent surrendered all drug prescribing permits within three months from the date of the Final Decision.

**Order**

By a majority vote of the full authorized membership of the Board considering this matter it is hereby this 21st day of December 1990

**ORDERED** that the **SUSPENSION** of Respondent's license to practice medicine in Maryland is hereby **STAYED**; and be it further

**ORDERED** that Respondent is subject to the following conditions of **PROBATION**:

1. Respondent shall not prescribe any medication for which a State or Federal permit is required;
2. Respondent may only practice medicine as a medical consultant at the Social Security Administration; and
3. Respondent must take twenty-five additional Category 1 hours of continuing education each year during the probation, which is approved by the Board or the Settlement Conference; and be it further

**ORDERED** that in the event that the Respondent terminated his position at the Social Security Administration, he must notify the Board within twenty-four hours of his termination; and be it further

ORDERED that if the Board receives a report that Respondent has violated a term of probation, the Board, without prior notice and an opportunity to be heard, may lift the stay of suspension of Respondent's license, provided that Respondent is given immediate notice of the charges and an opportunity to be heard thirty days after requesting same. Any findings made in such a hearing shall be by a preponderance of the evidence; and be it further

ORDERED that this Order is considered a public document pursuant to *Maryland State Government Code Ann.*, §§10-611, *et seq*

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

### Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of six pages.

1. By signing this Consent, I hereby submit to this Order and its conditions.

2. I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.

3. I acknowledge that by consent to this Order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my license to practice medicine in the State of Maryland.

I, Louis J. Pratt MD, have read this Consent Order and have carefully reviewed each and every part with my attorney, Norman Polovoy, Esquire. I understand it and voluntarily agree to it.

I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and the terms of the Order.

LOUIS J. PRATT MD

In the Matter of  
Waheeda S. Qaiyumi MD  
Before the  
Maryland Board of  
Physician Quality Assurance  
  
Amended Final Decision

By Final Decision dated November 6, 1989, the Board of Physician Quality Assurance (the Board) voted to revoke the license of Waheeda Qaiyumi MD (the Respondent). The Final Decision stated that on or after October 1, 1990, Respondent could petition the Board for reinstatement of her

license but that in no event would Respondent's license be reinstated prior to November 27, 1990.

Respondent petitioned the Board through its Settlement Conference for reinstatement of her license on December 5, 1990. At its meeting on December 12, 1990, the Board considered the Settlement Conference's recommendation and voted to amend its Final Decision as follows:

### Findings of Fact

1. The Findings of Fact of the Board's Final Decision dated November 6, 1989 are incorporated by reference.

2. Respondent's license was revoked on November 6, 1989.

3. Prior to the Board's issuing charges which formed the basis for the Board's Final Decision of November 6, 1989, the Board had initiated an investigation into Respondent's medical practice. Before the Board issued its Final Decision, the Board received a peer review report that indicated that Respondent was practicing substandard medicine. The Board voted to charge Respondent on July 12, 1989, based on this report under HO §14-504(a)(4) and (22). However, because of the Board's action in Case Number 88-0359, this action was stented and charges did not issue.

4. Respondent presented the following information to the Board as to her activities since November 6, 1989:

- Documentation of continuing education taken in the area of medical business records;
- Documentation that Respondent had notified her patients that she was ceasing the practice of medicine; and
- Letters of recommendation from former patients

### Conclusions of Law

The Board incorporates by reference the Conclusion of Law contained in its Final Decision of November 6, 1989 and further concludes that Respondent's license is REVOKED and Respondent can petition the Board for reinstatement of her license.

### Order

By a majority vote of the full authorized membership of the Board considering this matter, it is hereby this 21st day of December 1990

ORDERED that the Board will not consider Respondent's petition for reinstatement of her license until such time as Respondent submits evidence of the following:

- Respondent has completed all continuing education requirements for three years proceeding the time of the petition for reinstatement, such re-

quirements being a total of one-hundred-and-fifty credits for this time;

2. Respondent submits an analysis and evidence of the continuing education courses taken in medical billing since the date of the Board's first Settlement Conference in this case in January of 1989, which courses cannot be used to fulfill the required continuing education credits; and
3. Respondent has been evaluated by Edward J. Kowalewski MD, Professor Emeritus, School of Medicine, University of Maryland at Baltimore, Department of Family Medicine (the Evaluator). The evaluation would cover an overview of Respondent's practice and focus upon Respondent's knowledge and practice of Family Practice. Respondent would bear the expense of this evaluation and must sign releases permitting the Board to give the Evaluator information to assist in the evaluation, permitting the Board to inform the Evaluator of the final resolution of this matter, and permitting the Evaluator to forward his report to the Board. Respondent must comply with all reasonable requests of the Evaluator; and be it further

ORDERED that in the event that the Evaluator's report reveals no deficiencies, the Board would stay the revocation of Respondent's license subject to the following conditions of probation:

1. Respondent would be permitted to return to a practice setting approved by the Settlement Conference and practice under supervision; and Respondent would sign a release permitting the Board to receive monthly reports from Respondent's supervisor;
2. Respondent takes and passes the first available Special Purpose Examination (SPEX) with a minimum score of 75. Respondent shall bear the expense of taking this examination; and be it further

ORDERED that in the event Respondent fails the SPEX, the stay on the revocation of Respondent's license would be lifted; and be it further

ORDERED that in the event that Respondent passes the SPEX and her supervisor's reports are satisfactory, Respondent would be permitted to practice without supervision in a practice setting approved by the Board of the Settlement Conference, subject to the following conditions:

1. For three years, Respondent would be subject to practice reviews, the expense of which would be her responsibility. In the event that the practice review indicated that Respondent was a danger to herself or the public, the stay of revocation would be lifted without prior notice and an opportunity to be heard, provided that Respondent was given a hearing within thirty days of requesting same.

The burden of proof in such a hearing would be the preponderance of the evidence; and

2. Respondent must take twenty-five additional Category 1 hours of continuing medical education each year during the probation, approved by the Board or the Settlement Conference; and be it further

ORDERED that in the event that the Evaluator's report reveals deficiencies in Respondent's medical practice, Respondent must remediate the enumerated deficiencies and follow any reasonable recommendations given by the Evaluator prior to petitioning the Board for reinstatement of her license; and be it further

ORDERED that in the event that the Board stays the revocation of Respondent's license and thus reinstates Respondent's license, the Board can impose any additional normally reasonable conditions of probation; and be it further

ORDERED that this Order is considered a public document pursuant to *Maryland State Government Code Ann.*, §§10-611, *et seq.*

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

### Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of seven pages.

1. By signing this Consent, I hereby submit to this Order and its conditions.

2. I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.

3. I acknowledge that by consent to this Order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my license to practice medicine in the State of Maryland.

I, Waheeda S. Qaiyumi MD, have read this Consent Order and have carefully reviewed each and every part with my attorney, David S. Harvis, Esquire. I understand it and voluntarily agree to it.

I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and the terms of the Order.

WAHEEDA S. QAIYUMI MD

## Marcia C. Noyes: Making a Life

The week of April 14-20, 1991 has been designated as National Library Week (NLW), a time to recognize the contributions made by all types of libraries to the citizens of the United States. Sponsored by the American Library Association (ALA), NLW is also endorsed by the Medical Library Association (MLA) and the Special Libraries Association (SLA). The 1991 theme is "Read. Succeed." During this same week SLA is also sponsoring the first International Special Librarians Day on April 18. Their slogan is "Information beyond borders: Building global partnerships."

Med Chi's library has been very fortunate to have a number of librarians who exemplified both these motifs. The most notable was Marcia Noyes (Figure 1), our librarian from 1896 until 1946, a period of fifty years. She came to Med Chi shortly before our centennial year, when the collection included approximately 7,000 volumes.<sup>1</sup> This was in the days before Library of Congress catalog cards, National Library of Medicine classification, American Library Association filing rules, or the Regional Medical Library system.

Ms. Noyes' long tenure as librarian and Faculty secretary is, in large part, due to another of Med Chi's legends. Dr. William Osler, who was appointed as a professor at the brand new Johns Hopkins School of Medicine in 1894, was disappointed to find a small, disorganized, and outdated library collection at Med Chi. When he became president of the Faculty in 1896, he had the authority to improve the library, both financially and organizationally. Osler determined that "an intelligent, dedicated, full-time medical librarian"<sup>1</sup> was just what the collection needed. For recommendations, he turned to Dr. Bernard Steiner, head librarian at Enoch Pratt Free Library. Steiner immediately suggested Marcia Noyes.

A native of New York, Ms. Noyes was a graduate of Hunter College with no previous medical training. During an extended visit with her sister here in Baltimore, she took what was intended as a temporary job at the Pratt Library. Ms. Noyes had been at Pratt for about three years, working at stock-taking and cataloging, when she met with Dr. Osler.<sup>1</sup> Osler and the other physicians who interviewed her knew a good thing when they saw it. As Noyes herself described it: "In less than two weeks from the time I learned of the existence of such an organization, I found myself domiciled on the third floor (Figure 2)."<sup>2</sup>

With characteristic modesty, Noyes admitted she had no medical background: "I take no credit for special fitness for the position, except that I could fill the requisite that I must reside in the library building."<sup>2</sup> This was so the library could be open twenty-four hours a day, which was customary for medical libraries of the time. Years later, Noyes described her initial

Figure 1. A formal portrait shows Marcia Noyes as she appeared at the beginning of her career.

feelings of inadequacy: "[M]y first reader was, I believe, Dr. John Ruhrah, sent up. . . to pass judgment on the new librarian. I have always wondered what the report was, for I was on my hands and knees wrestling with some huge old A.M.A.'s in the Journal Room. . . The carpets and booklined walls deadened all sounds, and such a surprise attack made the move of my desk to the first floor a necessity. I have never forgotten it, nor my chagrin."<sup>2</sup>

Soon the executive abilities Osler had recognized came to the fore. In her first year on the job, Ms. Noyes developed her own book classification system based on *Index Medicus*. She plied various Faculty members with medical questions until she was confident in her own knowledge of the literature and terminology. Finances were so tight that Noyes had only one assistant for the first ten years, a janitor. Several former colleagues from Pratt were drafted to do cataloging in the evenings.<sup>1</sup> She borrowed and begged supplies, while encouraging wealthy physicians to make substantial donations. Perhaps her most difficult task was erasing

the uncertainty and sometimes even hostility of the conservative, mostly male physicians regarding a young, single, female librarian. She attended virtually every Faculty function and made a point of keeping abreast of all activities.<sup>3</sup>

One of Ms. Noyes' most satisfying accomplishments was the completion of the Faculty's current building in 1909. This entailed an entire year of constant fundraising, as well as four weeks of actual moving.<sup>2</sup> In between, Noyes made it her business to keep track of construction, insisting that agreed upon specifications be met, and climbing about the half-finished structure.<sup>3</sup> She even planted flowers around the building. Her new quarters were on the fourth floor, in what she often referred to as Baltimore's first penthouse.<sup>1</sup>

Marcia Noyes was not only the Faculty's first trained librarian, but virtually its entire staff for some time. As the Faculty grew larger and more complicated, it reorganized in 1904 according to American Medical Association guidelines. Ms. Noyes became Faculty Secretary and in 1925 her title became Executive Secretary.<sup>3</sup> During her tenure, the Faculty provided staffing for the Board of Medical Examiners, the Baltimore City Medical Society, and the Nurses' Directory.<sup>2</sup>

By the time Noyes retired nearly half a century later, both the library and the Faculty had come a long way. The collection had increased to some 65,000 volumes and the library had invested funds of 90,000 dollars.<sup>1</sup> The Faculty staff had grown to ten,<sup>2</sup> with the newest employee having fourteen years with the association. The staff was extremely loyal to Ms. Noyes, especially appreciating her habit of giving credit for successes to others and taking the blame for failures herself.<sup>1</sup>

Marcia Noyes also had an impact on the library

profession. In 1898, she participated in the founding of what is now the Medical Library Association (MLA). The eight charter members decided that the objectives of the new association would be to promote medical libraries and expedite the exchange of medical literature.

One of the most important functions of MLA was the Exchange, through which members traded duplicate items for those needed. Beginning in 1900, Ms. Noyes directed the Exchange. However, by 1904 the Faculty no longer had the extra space required to store and manage the surplus materials, so the Exchange operations were transferred to New York. After several years of mismanagement, the Exchange and MLA were on the verge of collapse. In 1909, the MLA secretary appealed to Ms. Noyes to take over the Exchange. With the help of Dr. John Ruhrah, who was then MLA treasurer, the Exchange gradually revived. In 1926, due to the increased work involved, Noyes again relinquished responsibility for the Exchange.

Ms. Noyes was also instrumental in the establishment of a journal for the new association. She was one of the editors of MLA's second attempt, the *Bulletin of the Association of Medical Librarians*, published in 1902. After another failed journal, MLA tried again with the *Bulletin of the Medical Library Association*. The team of Noyes and Ruhrah edited the first issue in 1911. Ms. Noyes and Dr. Ruhrah remained as editors until 1926, leaving a viable publication<sup>1</sup> that still serves as MLA's official journal today.

The respect MLA felt for Marcia Noyes was evidenced by her election as the Association's president in 1934. This was especially significant since she was the first non-physician president, as well as the first woman president. The accomplishments Ms. Noyes listed as most important during her presidential year were the incorporation of the Association and adoption of a seal. Association members urged her to accept another year as president, but she declined.

Both the Medical Library Association and the Faculty recognized the unique value of this woman, full of boundless energy and administrative talent. Shortly after her death in 1948, MLA initiated the Marcia C. Noyes Award for outstanding achievement in the field of medical librarianship. While Ms. Noyes always insisted she was not a professional woman, she certainly dedicated most of her life to medical librarianship.<sup>1</sup>

Fortunately, the Faculty was able to show its appreciation during Ms. Noyes's lifetime. The respect members had for her is reflected in the remarks of Dr. Henry M. Fitzhugh,

Figure 2. This photograph, taken in her apartment at 847 North Eutaw, the prior home of Med Chi, shows some of Ms. Noyes' many interests.

**Figure 3.** This photograph accompanied an article in the **Baltimore Sun**, honoring Miss Noyes on the occasion of her fiftieth anniversary at the Medical and Chirurgical Faculty of Maryland.

President during the library's centennial year of 1930: "[A]n enterprise which has as many details to look after as this Faculty and its library have, does not run itself. . . It must have the unselfish service of someone who has not only fine capacity, but whole-souled loyalty as well. . . for over one-third of its life our library has been the beneficiary of just such service as I have mentioned. . . the one who has dedicated her very life to our interests is our splendid friend, Miss Noyes."<sup>2</sup>

With the approach of Noyes's fiftieth anniversary (Figure 3) as Faculty librarian, a committee was formed to arrange a reception in her honor. Finding that the celebration was scheduled during the annual meeting in April, Ms. Noyes insisted that it be put off until the true anniversary in November. The physicians, however, were concerned about her failing health. For possibly the first time in memory, Ms.

Noyes was overruled and the tribute was held April 24, 1946. Over 250 physicians attended,<sup>1</sup> hearing addresses by Dr. Harry Friedenwald, a fifty-year member of the library committee, and Mary Louise Marshall, librarian at Tulane Medical School.

Marcia Noyes retired in July of 1946 and died on November 24 of the same year.<sup>4</sup> She had requested that her funeral be held in the building she considered her home, the Faculty's headquarters.<sup>1</sup> Hers is the only funeral ever to be held here. The service was conducted in Osler Hall,<sup>4</sup> with some sixty physicians from all over Maryland acting as honorary pallbearers.<sup>1</sup> Ms. Noyes is buried in Greenmount Cemetery, under a plain stone that reads only "MARCIA C. NOYES 1869--1946."<sup>5</sup>

Both the Faculty and the medical library profession are indebted to this unassuming, gracious woman. She took a small, disorganized collection with no staff and no budget, and painstakingly turned it into one of the most important special libraries in the region.<sup>4</sup> Her organizational abilities kept the Medical Library Association from drowning in red ink and mismanagement at several crucial times. With her dedication to the future, she helped shape the vocation of medical librarianship. Marcia Noyes herself would doubtless have discounted such high praise, probably replying simply: "If I have accomplished anything, let that speak for me, as while making a

living, I tried to make a life."<sup>1</sup>

## PHYSICIAN'S RECOGNITION AWARD

### Recipients

During the month of January 1991, the physicians listed below received the American Medical Association's (AMA's) Physician's Recognition Award. Established in 1968, the Award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

Avin, Brian Howard  
Blenko, John Walter  
Green, David

Kalman, Matthew Aaron  
Kay, Lawrence Edward  
Mahmood, Tariq

Mamodesene, Dora Marie  
Matera, Paul Anthony  
O'Connor, John J.

Scheiner, James Joseph  
Silby, Howard Michael  
Tyson, William Alva Way

Werth, Gloria Ruth

### Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

#### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degrees, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles.

Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both the principal author and **MMJ**.

\* \* \*

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

JSA HEALTHCARE CORP.

An Equal Opportunity Employer

## EMERGENCY PHYSICIANS

Well established, successful, independent fee-for-service group, based in a modern suburban community hospital, seeks career-oriented emergency physicians. Part-Time. Primary responsibility for patients on "fast track" and assist full-time physicians with more acute, complex patients as needed. Bonus incentives and flexible schedule. Close to Annapolis and ocean communities. Board prepared in EM or related field. Available immediately.

Please contact and send CV to:

Walter L. Scheetz, MD, Director  
Emergency Medicine Department  
North Arundel Hospital  
301 Hospital Drive  
Glen Burnie, MD 21061  
(301) 787-4571/4572

## Speak Out on Consultation

*Consultation*, a twice-weekly radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation weekly:

### Consultation "LIVE"

An hour-long *live* program  
Airs Sunday from 2:00 to 3:00 p.m.  
Broadcast across the country  
Call-in format: Physician answers questions from listeners

### Consultation "PRETAPED"

A half-hour *pretaped* program  
Airs Sunday at 7:30 a.m.  
Broadcast on WBAL - AM radio  
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below. Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

Name \_\_\_\_\_ Specialty \_\_\_\_\_

Address \_\_\_\_\_

City \_\_\_\_\_ Zip \_\_\_\_\_ Phone \_\_\_\_\_

(301) 682-7046

## FULL TIME EMERGENCY PHYSICIAN

Large, urban emergency department seeing 50,000 patients per year in teaching hospital. Excellent salary and benefits.

Please contact:

Anne Salmon Barone, Ph.D., M.D.  
or Dr. Jerome Snyder  
St. Agnes Hospital  
900 S. Caton Avenue  
Baltimore, MD 21229  
(301) 368-2012 or  
(301) 368-2000

In the March issue of the *Maryland Medical Journal*, an error was made in the Table associated with Dr. Snow's article, "Improving Preventive Care in General Medical Practice." (Beneath the heading *Immuniza-*

*tion*, it should have read "Over 64 years of age" versus "Under 65 years of age.") A corrected Table is printed below. *MMJ* regrets the error.

## Table. Guidelines for the Periodic Health Visit for Asymptomatic, Low-risk Adults, Ages 19 and Over

Schedule: Ages 19-64, every 1-3 years; ages 65 and over, yearly or as noted.

### LEADING CAUSES OF DEATH

#### Ages 19-39

Motor vehicle accidents  
Homicide  
Suicide  
Injuries  
Heart disease

#### Ages 40-64

Heart disease  
Lung cancer  
Cerebrovascular disease  
Breast cancer  
Colorectal cancer  
Obstructive lung disease

#### Ages 65 and over

Heart disease  
Cerebrovascular disease  
Obstructive lung disease,  
pneumonia/influenza  
Lung cancer  
Colorectal cancer

### SCREENING

#### History

Dietary intake  
Physical activity  
Tobacco/alcohol/drug use

#### Over 64 years of age:

Prior symptoms of transient  
ischemic attacks (TIA)  
Functional status at home

# Why buy an office automation system that doesn't offer a long-term solution?

## ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

### **IBM® and compatible hardware.**

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

### **Long-term support.**

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people

are always there to make sure your system fits your needs over the years to come.

### **Easy to operate.**

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

# Our Members Are Not Dying For A Free Tail.

Strangely enough, some companies are trying to sell Maryland physicians a professional liability policy that requires them to die or become permanently disabled in order to get a free tail. At Medical Mutual, our members can get a free tail while they are very much alive.

We make the tail available at no extra cost for those of you who are planning to retire from the practice of medicine after five consecutive years on our claims made and/or occurrence policy. If retirement is not in your plans, our tail is free at any age after 15 consecutive years on our claims made policy. As an added feature, you may step down from a higher rated specialty to a lower rated one with no tail charge for making the change.

Your broker or our Member Services Representatives can answer your questions about tail provisions for Medical Mutual members.

Of course, we also give a free tail in the event of your permanent disability or death.

We just don't think this should be your only choice.

# Why buy an office automation system that doesn't offer a long-term solution?

## ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

### **IBM® and compatible hardware.**

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

### **Long-term support.**

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people

are always there to make sure your system fits your needs over the years to come.

### **Easy to operate.**

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

## DEPARTMENT OF HEALTH AND MENTAL HYGIENE GUIDELINES FOR TUBERCULOSIS CONTROL

### I. INTRODUCTION:

The following are minimum recommendations for the State of Maryland. A Health Officer or Medical Director of an institution may establish more stringent guidelines for defined subpopulations. There are ample data to indicate that the following regimens are safe, effective, cost efficient and improve patient compliance.

All patients with tuberculosis should be offered HIV testing and counseling. Any high risk or suspected HIV infected patient who declines serologic testing should be treated for tuberculosis as if he/she were HIV positive. This will ensure an efficacious regimen.

### II. TREATMENT OF TUBERCULOSIS

#### A. Recommended regimen in adults (see special considerations below).

Strictly supervised chemotherapy with:

Isoniazid (INH) 5-10 mg/kg up to 300 mg p.o. daily  
and

Rifampin (RMP) 10 mg/kg up to 600 mg p.o. daily  
and

Pyrazinamide (PZA) 15-30 mg/kg up to 2 gm p.o. daily

These three drugs should be given for eight weeks; this "induction" phase is then followed by four months of supervised therapy with:

#### TWICE WEEKLY

INH - 15 mg/kg p.o. (for individuals weighing > 120 percent of ideal weight use ideal body weight estimates to calculate dosage up to maximum of 900 mg p.o.)

#### OR

#### DAILY

INH - 5-10 mg/kg up to 300 mg p.o.

#### and

RMP -- 10 mg/kg up to 600 mg p.o.

#### and

RMP-10 mg/kg up to 600 mg p.o.

Six month treatment regimens are not appropriate for persons with HIV infection. (see section B.5)

### B. Special Considerations

#### 1. Drug resistance:

If resistance to INH or rifampin is suspected (for example, because of a history of inadequate treatment, exposure to drug-resistant tuberculosis or-

ganisms, or the patient comes from an area of the world where drug resistant tuberculosis is prevalent, etc.) this therapeutic regimen should be modified. The above treatment regimen should be supplemented with streptomycin (SM, the drug of first choice, because of its bacteriocidal properties) or ethambutol (EMB, as the drug of second choice, be-

cause of its bacteriostatic properties) with therapy started under strict supervision, i.e., the direct observation of or administration of medications. If INH or RMP resistant organisms are confirmed on culture, treatment is continued with an appropriate multi-drug ( $\geq 3$  drugs) regimen for a minimum of 9 to 12 months and at least 6 months after documented culture conversion to negative. Never add one drug to a failing regimen.

## 2. Extrapulmonary disease:

Extrapulmonary disease should be treated with the same regimens recommended for pulmonary disease.

## 3. Tuberculosis in children:

INH	10-20 mg/kg up to 300 mg p.o. daily
RMP	10-20 mg/kg up to 600 mg p.o. daily
PZA	25-30 mg/kg up to 2 gm p.o. daily

INH, RMP, and PZA daily for eight weeks followed by INH and RMP daily or twice weekly for four months. The twice weekly dosage of RMP remains the same. When given in a twice weekly schedule, the dosage of INH increases to 20 to 40 mg/kg up to maximum of 900mg.

## 4. Tuberculosis in pregnancy:

Tuberculosis disease diagnosed during pregnancy should be treated without delay.

Recommended regimen:

INH	5-10mg/kg up to 300 mg p.o. daily
RMP	10 mg/kg up to 600 mg p.o. daily
Ethambutol (EMB)	15 mg/kg (pre- pregnancy weight) daily

These 3 drugs are to be given for eight weeks followed by INH and RMP daily for seven months. SM, PZA, and ethionamide should be avoided during pregnancy because of potential toxic effects on the fetus. Pyridoxine 25 to 50/mg/day should be given concurrently when INH is given to a pregnant woman.

## 5. Tuberculosis in HIV Infected Patients:

For patients with HIV infection and tuberculosis, at least nine months and preferably 12 months of chemotherapy are recommended. Therapy should continue at least six months after cultures have become negative.

All AFB smear or undifferentiated culture positive HIV infected patients should be considered to have active M. tuberculosis infection. Appropriate antituberculosis therapy with supervision, should be instituted immediately. If the final culture turns out to be an atypical mycobacterial organism, then therapy will need to be adjusted or terminated.

## 6. Hepatic disease

"Mild dysfunction (e.g. alcoholism) does not necessarily influence the choice of drugs; however,

monitoring of hepatic function is important. Elevations in the concentration of serum glutamic-oxaloacetic transaminase (SGOT or AST) or serum glutamic-pyruvic transaminase (SGPT or ALT) to three to five times normal should lead to a reassessment of the situation. Regimens may be continued, stopped, interrupted, or changed as a result of this assessment." (Chest 87, (1985) Supplement)

## C. Sputum Examination

At least three sputum specimens should be collected at least 24 hours apart before any drug regimen is initiated. In some cases when clinically warranted, the patient may be started on treatment and sputum specimens obtained during the first week of therapy. Drug sensitivities should be obtained on initial sputum specimens sent for culture but should not be ordered on subsequent specimens; should be "deep cough" sputum, not saliva, and of a quantity equal to at least 5 ml. Sputum induction may be necessary to obtain a specimen of sufficient quality and quantity.

Sputum specimens should be collected monthly until cultures are no longer positive. Positive culture results after three months of chemotherapy suggest the possibility of treatment failure due to drug resistance or to noncompliance. Under these circumstances, the following are recommended:

1. Never add only one drug to a failing regimen.
2. Order repeat drug susceptibility studies.
3. Add or substitute at least two new drugs to which the organisms are known to be sensitive.
4. Monitor by sputum smear and culture on a monthly basis.
5. Institute DIRECTLY OBSERVED THERAPY (assistance available from local health departments)

## D. X-ray Examination

1. All persons being evaluated for possible tuberculosis should have an initial chest x-ray.
2. The physician may obtain a chest x-ray at the end of the course of therapy.

Routine, periodic x-ray examinations during the course of treatment are not recommended.

The following are the statements of the U.S. Public Health Service regarding x-ray examinations during and following tuberculosis treatment:

### "Routine Follow-up of Tuberculosis Patients Who Have Completed Treatment"

Repeated Chest x-ray examinations of symptomatic tuberculosis patients who have completed treatment have been shown to be of insuffi-

cient clinical value or productivity to justify their continued use.

### **Routine Periodic Chest X-Ray Examinations During Tuberculosis Treatment**

Radiographic stability does not necessarily indicate success or failure of chemotherapy as reliably as the results of sputum smear and culture, and assessment of symptoms and clinical status. However, an occasional x-ray examination may have value in confirming bacteriologic and clinical findings and enhancing patient compliance."

3. Periodic x-rays may have clinical usefulness in monitoring response to treatment in tuberculosis cases who were smear and culture negative prior to treatment

### **E. Monitoring for side effects of medications**

1. Obtain pretreatment baseline studies as follows:

a. In patients suspected of having hepatic disease, renal disease or gout, obtain liver function test results, creatinine, or uric acid respectively.

b. In patients receiving streptomycin, obtain baseline audiogram.

c. In patients receiving ethambutol, obtain baseline visual acuity and red/green color discrimination.

2. In each of the above circumstances, the patient should be monitored with repeat studies on a monthly basis.

3. In all other cases, laboratory studies should be obtained any time signs or symptoms suggesting adverse drug reactions are present.

4. Treatment of active tuberculosis should not be delayed while awaiting results of baseline monitoring studies.

### **F. Reporting Cases**

Physicians and other health care providers are required to report suspected and confirmed cases of tuberculosis and mycobacteria other than tuberculosis (MOTT) to the local health officer (COMAR 10.06.01). Physicians caring for persons with tuberculosis will be requested to complete periodic status reports on these cases to assure that all cases become non-communicable as quickly as possible. Consultation on the management of tuberculosis is available from local health departments and from the Division of Tuberculosis Control, Maryland Department of Health and Mental Hygiene (301) 225-6698.

### **G. Diagnosis**

Persons with suspected tuberculosis should be referred for an appropriate examination which should normally include: a Mantoux tuberculin test; a chest x-ray; a bacteriologic exam; and a physical exam.

## **1. Signs and Symptoms**

- It is important to obtain a complete history (including a history of exposure to tuberculosis) and perform a thorough physical examination for persons with suspected tuberculosis.
- Pulmonary tuberculosis should be suspected in persons with a productive, prolonged cough (over 2 weeks duration) which progressively worsens. Other symptoms of tuberculosis include fever, chills, night sweats, easy fatigability, loss of appetite, weight loss and hemoptysis (coughing up blood).
- About 15 percent of tuberculosis cases present with disease at an extrapulmonary site as the major site of involvement. Symptoms of extrapulmonary tuberculosis vary depending upon the site affected, but tuberculosis should be considered as a differential diagnosis in ill persons who are at higher risk for tuberculosis (e.g., those with a recent history of exposure, recent tuberculin skin test conversion, immigration from a country with a high prevalence of tuberculosis, immunosuppressed patients, the elderly, minorities, [including Blacks and Native Americans], the homeless, other persons from lower socioeconomic groups, etc.).

## **2. Demonstration of Mycobacteria**

### **a. Specimen Collection**

- Persons with suspected pulmonary or laryngeal tuberculosis should have at least 3 sputum specimens examined by smear and culture. It is desirable that the first specimen be obtained under supervision. A series of 3 early morning specimens collected on successive days is desirable. If the acid-fast smears from these 3 specimens are negative, 3 additional specimens should be collected.
- To produce good sputum specimens, patients need to know the reason for testing. Patients should be informed that the material brought up from the lungs after a productive cough is sputum. Nasopharyngeal secretions and saliva are not sputum.
- For patients unable to raise sputum, aerosol induction can be used to stimulate the production of sputum. Patients should be instructed to take several normal breaths of the aerosol mist, inhale deeply, cough with force (while covering their noses and mouths with tissues to avoid contaminating the air), and then expectorate into the specimen container. They should be given time - 15 minutes is usually sufficient - to produce sputum, which in most cases is brought up by

a deep cough. Because the induced sputum is very "watery" and resembles saliva, it should be labeled "induced" to ensure that the laboratory staff do not discard it.

- The cough induced by aerosol induction method is often violent and uncontrolled. Therefore, to protect health care personnel, collection rooms should have some means of air control, such as induction booths equipped with exhaust fans, or portable hoods with HEPA (high efficiency particulate air) filters, ultraviolet light, or a combination of both. Detailed infection control measures may be found in "Guidelines for Preventing Tuberculosis" MMWR Vol. 39, No RR-17 December 7, 1990.
- Coaching each patient individually on how to expectorate can facilitate sputum collection. Patients are seldom successful in providing an adequate specimen if they are left alone. Coaching is especially necessary in the collection of the first specimen. The amount of nursing support required on subsequent visits will depend on individual patient needs.
- Gastric aspiration can also be used to obtain swallowed sputum specimens, and may be necessary to obtain specimens from young children.
- Bronchoscopy should only be done if the patient cannot produce a sputum specimen and there is reasonable doubt about the diagnosis of tuberculosis. Bronchial washings, brushings, and biopsy specimens may be obtained depending upon the differential diagnostic possibilities and the observed findings. Sputum collected after bronchoscopy may also prove to be diagnostically useful.
- Because tuberculosis can occur in almost any anatomical site, a variety of clinical specimens other than sputum may be submitted for examination when nonpulmonary mycobacterial disease is suspected (e.g., urine, cerebrospinal fluid, pleural fluid, pus, biopsy specimens, etc.). Tissue specimens should be placed in saline solution and not be placed in formalin.

#### b. Laboratory Examination

- Detection of acid-fast bacilli in stained smears examined microscopically may provide the first bacteriologic clue of tuberculosis. It is an easy and quick procedure which permits the presumptive diagnosis of tuberculosis.
- Health care providers wishing to submit specimens to the Mycobacteriology Laboratory of the Maryland Department of

Health and Mental Hygiene may obtain collection kits through the local health department. Use only the container furnished by the State Health Department as these are carefully constructed in accordance with postal regulations. Specimens should reach the laboratory not later than 24 hours after being taken. Specimens may be submitted via mail or through the local health department. Contact your local health department for instructions.

- Follow-up sputum examination for initially positive patients is the most important way to judge infectiousness and to monitor response to therapy. At a minimum, specimens should be obtained at monthly intervals until the patient converts to negative.
- Culture examination is essential to confirm the diagnosis of tuberculosis by growth of *M. tuberculosis*. It normally takes 3 to 6 weeks for culture results to be reported, although some laboratories are now doing radiometric testing which provides results in as little as 10 days.
- When sputum is sent to the Maryland Department of Health and Mental Hygiene Mycobacteriology Laboratory, initial reports of positive smears or cultures, or emergence of drug resistance, are reported by telephone to the health department (and the medical care provider if different from health department). Follow-up results are reported by mail.
- Studies of drug susceptibility on initial isolates are recommended for all patients but are required for patients with an increased risk of drug resistance (e.g., foreign-born persons from areas with high rates of resistance, persons with a history of previous treatment with antituberculosis drugs, cases with positive bacteriology after 3 months of therapy, contacts of drug resistant cases).

#### 3. Radiographic Examinations

- A posterior-anterior view of the chest is the standard radiograph needed for detection and description of chest abnormalities. In some cases, other views (e.g., lateral, lordotic) may be necessary.
- With tuberculosis, chest abnormalities usually occur in the apical and posterior segments of the upper lobe or in the superior segments of the lower lobe. However, lesions may appear anywhere in the lungs and vary in size, shape, density, and cavitation. Abnormalities on chest radiographs are suggestive of, but not diagnostic for, tuberculosis.

**MMJ Receives Congratulations**

I would like to congratulate the *Journal* for its March 1991 issue on Maryland Medicine. I particularly enjoyed the history of the Department of Medicine by Dr. Woodward and his colleagues. That Department certainly reflects the best in medical education in this country.

I was particularly struck to learn that the first chairman was a student of Dr. Benjamin Rush (1746 to 1813), who was one of the four physicians to sign our Declaration of Independence when he was only thirty years old and was considered the Father of American Psychiatry. His textbook, *Medical Inquiries and Observations Upon the Diseases of the Mind*, was the first published on this topic in the western hemisphere, went through numerous editions and, according to Barton, was the dominant book on the subject for nearly seventy years. The influence that he had on so many of his students like Dr. Potter is still being reflected. The article notes the continuing priority that the Department of Medicine and the University of Maryland places on training in Psychiatry for the residents.

STUART L. KEILL MD  
Professor of Psychiatry  
University of Maryland

**The Patient's Advocate: A Response**

I have read your [Barton Gershen MD] editorial that appeared in the *Maryland Medical Journal* [February 1991]. All I can say is "Bravo!" Enclosed is a sampling of correspondence\* that I have had with the State Insurance Commissioner and with Traveler's Insurance Company.

Although my letters may not have been as eloquent as your editorial, my feelings, I think, were the same. I have objected to the use of the term "patient advocate," as it implies that the patient requires protection from some entity. It certainly does nothing to enhance the physician/patient relationship that must be assumed to be an adversarial one if a patient advocate is needed.

As you can see from the enclosed correspondence,\* the Insurance Commissioner has asked them to alter their form letter. Unfortunately, the Traveler's Company has ignored this directive. I have decided to avoid wasting more of my time trying to get the Traveler's

Company to change their way by writing to them or the Insurance Commissioner but have decided to write to the patients directly. Enclosed is a copy of the letter\* that I anticipate using. Perhaps if the people who pay their salaries expose them for what they really are, and that is, of course, insurance company advocates or utilization review coordinators, I would not be so disturbed by this practice.

Thanks for your editorial. I am glad that I am not alone. As you can see from one of the Traveler's responses, they took the position that since there were no other complaints that there was no problem. Nothing could be further from the truth.

STEVEN J. BRAND MD  
Frederick

\* Correspondence is available in the MMJ office.

**Specialty Status**

Legal counsel for Med Chi states clearly and succinctly that a difference does not exist between a physician who has been certified by one of the American Boards and one who has merely "fulfilled the requirements to attain eligibility to take the examinations."<sup>1,2</sup> Many of the individuals in the latter group may have failed to pass the examinations, either once or more times. Continued board eligibility status does not exist and is not recognized by the Boards.

This decision in the Code of Maryland Regulations is directly at odds with the thoughts of the Specialty Boards and in opposition to the promotion of quality assurance. In surgery, for example, the *Accreditation Manual for Hospitals* specifically states that specialty board certification is an excellent benchmark for the granting of surgical privileges. The reason for the Maryland decision to have two classes of specialists is not clear.

JOSEPH M. MILLER MD  
Baltimore

February 6, 1991  
 Springfield Hospital Center  
 Sykesville, MD 21784

Reynaldo L. Lee-Llacer MD, President  
 Med Chi Faculty of Maryland  
 1211 Cathedral Street  
 Baltimore, Maryland 21201

Dear Dr. Lee-Llacer:

On behalf of the Springfield Hospital Center Medical and Dental Staff, I wish to express appreciation for the ongoing support and assistance you have provided us over the last year and a half. Subsequent to the hospital administration's unilateral replacement of our Medical Staff Bylaws with an administratively loaded Medical Staff pseudo-organization (counter to the Joint Commission for the Accreditation of Health Care Organization's (JCAHO's) Guidelines), Med Chi has steadily been there for us.

Despite the fact that the hospital administration refused to allow Med Chi to negotiate differences between the Medical Staff and hospital administration, Med Chi not only offered its services in an attempt to resolve this painful and destructive impasse, but even sent a delegation of members from the Eastern Shore to investigate the problems; this committee drove many miles on snowy roads to meet with us until late one evening.

When it became apparent that legal measures were going to be required to allow the Medical Staff to return to its rightful functioning, Med Chi filed an *amicus curiae* brief in favor of the Medical Staff and requested that the American Medical Association do likewise -- which it did.

Subsequently, when the confusion (or whatever) led to a Joint Commission Survey Team not being made aware of the Medical Staff's lawsuit against the administration and the multiplicity of problems produced by this schism, Med Chi was again the staunch supporter and advocate for the Medical Staff. Your organization was in contact with JCAHO in an attempt to provide information, and Med Chi further enlisted the aid of the American Medical Association. Essentially as a result of your efforts, JCAHO is again returning to this hospital to conduct a focused survey to primarily consider Medical Staff Bylaws and Medical Staff functioning.

In essence, Med Chi has in every way been a strong, dependable, consistent advocate of our Medical Staff and, therefore, of quality patient care in our institution. It is my opinion that we are indeed fortunate to have such a State Medical Society and I wish that all Medical Staffs throughout our fair State of Maryland could know how much we and all physicians have benefitted from your organization.

In sincere appreciation,

Yours truly,

Ellis F. McClelland MD, Elected President  
 Medical Dental Staff  
 Springfield Hospital Center

Are you desperately in need  
of a **DEPENDABLE**  
office management system?

## Turn to The Medical Manager®— more than 10,000 in use, nationwide.

Many medical practices have had the unfortunate experience of going with an office computer system that had no "follow up." When you took two aspirin and called them in the morning, they weren't there.

That's why more and more doctors are switching to the No. 1 selling software for medical practice management in the country—The Medical Manager.® As the nation's second largest dealer, we have more Medical Management systems in operation in the mid-Atlantic states than any other dealer.

It's possible that our new system, customized for your particular practice, will cost less than updates you need for your old system. In some cases you can

use the hardware you have, since The Medical Manager® runs on most micro computers.

After we install The Medical Manager® system, we train your staff, and continue to provide on-going support *every time* you call!

Please tell us about your system and your needs. We'll give you a **FREE ESTIMATE** on converting your system. Yes, we make office calls!

# Executive Director's Newsletter

May 1991

## 1991 Annual Meeting

Med Chi's 1991 Annual Meeting will be held Wednesday, May 8 thru Friday, May 10 at the University of Maryland Center of Adult Education in College Park, MD.

This year's meeting features several special guest speakers including:

- C. John Tupper MD, President of the American Medical Association;
- Mrs. Marilyn Quayle\*;
- Mrs. Elizabeth Dole, President of the American Red Cross\*;
- The Honorable Melvin A. Steinberg, Lieutenant Governor of Maryland;
- The Honorable Steny H. Hoyer, U.S. Representative (D, MD);
- The Honorable Parris Glendening, County Executive, Prince George's County; and
- The Reverend Joseph A. Sellinger, President of Loyola College in Maryland.

*\*Invited to the meeting*

Scientific sessions for this year's meeting include *Recent Advances in Cardiology; Random Drug Testing of Physicians; Management of Acute Headaches; Primary Care of the HIV-Positive Patient; Cholesterol in Children; Current Treatment of Anxiety and Insomnia; and Changes in Medicare Reimbursement.*

Entertainment for this year's meeting includes a performance by the Capitol Steps, a political cabaret troupe from Washington, on Wednesday May 8th. A celebrity golf tournament will be held Thursday May 9th and will feature PGA pros, Fuzzy Zoeller, Nathaniel Crosby and Skeeter Heath. There will also be a presidential banquet honoring Reynaldo L. Lee-Llacer MD on Friday, May 10th.

For more information on the Annual Meeting, call Michael Moran at 301-539-0872 or 1-800-492-1056.

### *Directions to the Med Chi Annual Meeting at the University of Maryland Center of Adult Education*

The University of Maryland Center of Adult Education is located on the western edge of the University of Maryland College Park Campus at the intersection of University Boulevard (MD Route 193), Adelphi Road and Campus Drive. From I-495 (capital beltway), take exit 25 B to U.S. Route 1 South, then turn west (yield right) on MD Route 193. The Center of Adult Education will be visible on your left at the third traffic light on University Boulevard.

## Physicians in the Persian Gulf

Last month, Med Chi printed the names of several physicians who have been called to action because of "Operation Desert Storm." Since that printing, Med Chi has received names of several other physicians who have been called to duty:

Arturo E. Betancourt MD  
Lutgardo G. Panlilio MD  
Carol S. Ramsey MD

Robert S. Berger MD  
Nelson J. Realo MD

Med Chi would like to recognize these physicians for their dedicated service to our nation and wish all of America's Armed Forces a happy and safe homecoming.

If you know of a colleague who has been called to serve, please contact Betsy Newman in Med Chi's Public Relations Department at 301-539-0872 or 1-800-492-1056.

---

## *Med Chi Offers Assistance to VA Hospitals*

---

In a recent letter to the Veteran's Administration (VA), Med Chi offered to recruit volunteer physicians to augment VA Hospital staff who might be treating casualties from the war in the Persian Gulf. "We are grateful for your willingness to assist our medical center," wrote Veteran's Administration Medical Director, Barbara Gallagher, in response to Med Chi's proposal. "Due to the current cease fire in place in the Persian Gulf, we do not anticipate receiving any combat casualties at the Baltimore VA Medical Center. Thank you again for your offer of assistance to help us in meeting the needs of our Armed Forces personnel."

---

## *CHAMPUS Providers May Not Waive Patient Cost-Share*

---

Health care providers who routinely waive a patient's cost-share or advertise that they will waive cost-shares for certain beneficiaries are in violation of CHAMPUS laws and regulations, and may be investigated for program abuse and suspended or excluded as authorized providers.

The CHAMPUS program is meant to supplement care in military treatment facilities, and benefits have been deliberately designed so that using military care is financially advantageous. When CHAMPUS beneficiaries use civilian sources, they are responsible for paying their share of the cost.

When providers waive any beneficiary liability, the CHAMPUS-determined allowable charge will be reduced by the same amount, whether payment is made to the patient or the provider. In addition, a pattern of waiving a patient's cost-share or deductible is considered to be program abuse and the provider may be subject to administrative sanctions. Write-offs of bad debts under generally accepted accounting practices are not considered improper waivers of cost-shares.

---

## *Hepatitis B Perinatal Prevention Program*

---

The Immunization Division, Maryland Department of Health and Mental Hygiene (DHMH), has received supplementary funding from the Centers for Disease Control for a Hepatitis B Perinatal Prevention Program. The primary objective of this activity is to prevent morbidity due to perinatal transmission of the hepatitis B virus.

This program will coordinate and supplement various activities related to perinatal hepatitis B (HBV) in Maryland. Hepatitis B vaccine and hepatitis B immune globulin (HBIG), and hepatitis blood-screening provided by the program are designated for infants born to women who are HBV carriers, and for household and sexual contacts of these women. Recipients should be unable to purchase Hepatitis B vaccine and HBIG by other means (i.e., without insurance, without Medical Assistance, and unable to pay).

Additional information may be obtained from the Communicable Disease Section of your local health department or the DHMH Immunization Division at (301) 225-6679.

---

## *HCFA Allows Physician Counsel*

---

Health Care Financing Administrator Gail Wilensky PhD has concurred with the American Medical Association (AMA) that physicians in the Professional Review Organization (PRO) sanction process have the right to physician counsel as well as legal counsel.

In a letter to AMA Executive Vice President James Todd MD, Wilensky said physicians should have the right to have physician counsel present

during any meeting conducted under the PRO sanction process. Physician counsel may offer expert testimony and answer questions.

If you have any questions regarding the physician counsel issue, call Rose Matricciani, staff for Med Chi's PRO Monitoring Committee, at 301-539-0872 or 1-800-492-1056.

---

### *Prince George's County Medical Society Names New CEO*

---

Diane L. Briggs was recently named Executive Director of the Prince George's County Medical Society. Ms. Briggs comes to this position from the Montgomery County Medical Society where she had been Assistant Executive Director and Director of Communications since 1985. A former P.G. County public school teacher, Ms. Briggs has devoted a significant portion of her career in organized medicine to health education in the schools and the community by developing programs in smoking cessation and prevention, drug/alcohol use, and nutrition. In her capacity as Director of Communications, she was Managing Editor of *Montgomery Medicine*, a monthly magazine for Montgomery County physicians.

---

### *Doctor/Lawyer/ Teacher Partnership Against Drugs*

---

Physicians who have volunteered for or are interested in participating in the Doctor/Lawyer/Teacher Partnership Against Drugs are encouraged to attend a special meeting on Friday, May, 10 1991 during the Med Chi Annual Meeting at the University of Maryland Center of Adult Education in College Park, MD. During the meeting, doctors and lawyers who have participated in the program will talk about their experiences and accomplishments. In addition, there will be a discussion of future applications of the program and other techniques for drug abuse prevention in Maryland children.

---

### *Drug Abuse Conference Monograph Available*

---

Copies of a monograph of the proceedings of "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician," a Med Chi conference held in October 1990, are now available for Med Chi physicians. The monograph was developed as a follow-up to the conference and is intended to educate Maryland physicians about the growing need for medical intervention in the problem of substance abuse in our society. Copies of the monograph are available to Med Chi members for \$5.00. To order, call Lori Robinson in Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

---

### *Guide to HIV Care Available*

---

The AIDS Care Program of The Johns Hopkins Medical Institutions now offers, "Recommendations for Medical Care of Persons With HIV Infection," a booklet that provides guidelines for the care of patients with HIV infection. The recommendations in this booklet, dated January 1991, reflect the policies of the AIDS Care Program of the Johns Hopkins Hospital where approximately 2,000 persons with this infection are currently being followed. Physicians are cautioned that recommendations for AIDS care change frequently. An updated version of this guide is anticipated in 3-6 months. To order a free copy of the booklet, contact The Johns Hopkins Hospital AIDS Services at 301-955-1754.

---

### *AMA Hazardous Waste Pamphlet Available*

---

The AMA recently published "Why You Need to Know About Hazardous Waste," a new booklet designed to provide hazardous waste information to physicians concerned about the environment.

The booklet contains information on hazardous waste laws and offers guidelines on how physicians can protect their communities against haz-

ardous waste. To order a copy of this free booklet, write the AMA Department of Risk Assessment at 515 N. State St., Chicago, IL 60610 or call 312-464-4541.

---

## *New Abortion Law*

---

A copy of the changes made to the Maryland abortion law, as passed by the legislature and signed by Governor Schaefer on February 18, 1991, begins on page 347 of this issue and is provided for your information. Med Chi is currently studying this law and plans to provide physicians with guidelines to facilitate compliance with the law. Physicians are invited to review the changes to the law and mail inquiries to Stephen Buckingham, Esq. in Med Chi's Legal Department at 1211 Cathedral Street, Baltimore, MD 21201 (Inquiries may also be faxed to 301-547-0915).

---

## *Call for Papers, Presentations, Lectures*

---

Med Chi invites specialty societies, organizations, faculty members, academic centers, and Med Chi committees to participate in the scientific program at the 1991 Med Chi Semiannual Meeting to be held September 13 - 15, 1991 at the Carousel Hotel and Resort, Ocean City, Maryland.

Med Chi encourages specialty societies and organizations to collaborate in jointly planning sessions that will have a multidisciplinary/interdisciplinary focus. When feasible and appropriate, sessions should target the broadest spectrum of Maryland physicians.

An **Application For Presentation Submission** can be obtained by calling the Continuing Medical Education office at Med Chi, 301-539-0872 or 1-800-492-1056. **DEADLINE FOR SUBMISSION: FRIDAY, JUNE 3, 1991**

## MEET AT THE BEACH!

Hear invited guest speaker  
U.S. Surgeon General Antonio Novello MD  
at

**Med Chi's 1991 Semiannual Meeting  
Friday, Saturday and Sunday,  
September 13, 14, 15, 1991**

in the  
Carousel Hotel and Resort  
on the beach at 118th Street, Ocean City, MD 21842.

All physicians staying at the meeting are guaranteed  
an ocean front view.

Watch the Executive Director's Newsletter for  
more details on events and CME opportunities.

## **THE MARK OF EXCELLENCE**

For your insulin-mixing  
or NPH-using patients

## Humulin<sup>70/30</sup> makes life easier

**Rapid onset and sustained  
duration insulin activity  
in a single vial**

- May offer enhanced control through a more physiologic activity profile
- Accurate dosing—eliminates mixing errors
- Convenient premixed dose for better compliance
- Easy to use—for patients who find mixing difficult

Specify  
**Humulin<sup>70/30</sup>**  
70% human insulin  
isophane suspension  
30% human insulin injection  
(recombinant DNA origin)

**Humulin has  
just the right mix**

Any change of insulin should be made cautiously and only under medical supervision.

Changes in refinement, purity, strength, brand (manufacturer), type (regular, NPH, Lente®, etc), species (beef, pork, beef-pork, human), and/or method of manufacture (recombinant DNA versus animal-source insulin) may result in the need for a change in dosage.

**Abortion Bill**  
**Senate of Maryland: No. 162**

By: Senators Blount, Pica, and Baker  
Introduced and read first time: January 16, 1991  
Assigned to: Judicial Proceedings  
Committee Report: Favorable with amendments  
Senate action: Adopted with floor amendments  
Read second time: February 8, 1991

**CHAPTER 1**

AN ACT concerning

**Abortion**

FOR the purpose of revising certain statutory provisions relating to abortion; authorizing a physician to perform an abortion on an unmarried minor without notice to a parent or guardian of the minor if, in the professional judgment of the physician, the minor is mature and capable of giving informed consent or notice would not be in the best interest of the minor; prohibiting a physician from giving notice to a parent or guardian if the minor decides not to have the abortion; repealing a certain provision of law related to certain information that must be provided prior to an abortion; repealing certain provisions of law related to abortion referral services; *clarifying a provision of law related to referral services*; requiring that an abortion be performed by a licensed physician; providing that the State may not interfere with the decision of a woman to terminate a pregnancy if certain conditions exist and under certain circumstances; specifying that the State may not interfere with a woman's decision to terminate a pregnancy at any time if certain circumstances exist; providing a certain immunity for a physician under certain circumstances; authorizing the Department of Health and Mental Hygiene to adopt certain regulations related to the termination of a human pregnancy; repealing a provision of law related to the imposition of certain penalties against certain persons who violate certain provisions of law related to the termination of a human pregnancy; repealing a provision of law related to certain disciplinary actions against a licensed physician for performing an abortion outside a licensed hospital; defining certain terms; making provisions of this Act severable; *specifying that if a certain provision of this Act is petitioned to referendum and rejected by the voters, such rejection does not affect other provisions of the Act unless the other provisions are also petitioned to referendum and rejected by the voters* and generally relating to abortion.

BY repealing and reenacting, with amendments,

Article - Health Occupations  
Section 14-404(a)(23),(24),(25),(26),(27),(28),(29), and (30)  
Annotated Code of Maryland  
(1991 Replacement Volume)

SECTION 1, BE IT ENACTED BY THE GENERAL ASSEMBLY OF MARYLAND,  
That the Laws of Maryland read as follows:

**Article - Health - General**

20-103.

- (a) Except as provided in subsections (b) and (c) of this section, a physician may not perform an abortion on an unmarried minor unless the physician first gives notice to a parent or guardian of the minor.
- (b) The physician may perform the abortion without notice to a parent or guardian if:
  - (1) The minor does not live with a parent or guardian; and
  - (2) A reasonable effort to give notice to a parent or guardian is unsuccessful.
- (c) (1) The physician may perform the abortion, without notice to a parent or guardian of a minor if, in the professional judgment of the physician[,]:
  - (I) [notice] NOTICE to the parent or guardian may lead to physical or emotional abuse of the minor;
  - (II) THE MINOR IS MATURE AND CAPABLE OF GIVING INFORMED CONSENT TO AN ABORTION; OR
  - (III) NOTIFICATION WOULD NOT BE IN THE BEST INTEREST OF THE MINOR.
- (2) The physician is not liable for civil damages

or subject to a criminal penalty for a decision under this subsection not to give notice.

- (d) The postal receipt that shows an article of mail was sent by certified mail, return receipt requested, bearing a postmark from the United States Postal Service, to the last known address of a parent or guardian and that is attached to a copy of the notice letter that was sent in that article of mail shall be conclusive evidence of notice or a reasonable effort to give notice, as the case may be.
- (E) **A PHYSICIAN MAY NOT PROVIDE NOTICE TO A PARENT OR GUARDIAN IF THE MINOR DECIDES NOT TO HAVE THE ABORTION.**

**[Part I. Abortion Referral Services]**

[20-201.

A person may not engage in or advertise any abortion referral service that is carried on for profit and includes the referral or recommendation of any individual to a physician, hospital, health-related facility, or dispensary.]

[20-202.

A physician, hospital, health-related facility, or dispensary may not make an agreement with an abortion referral service located in or doing business in another state if the abortion referral service would be prohibited under §20-201 of this subtitle if the service were located in or doing business in this State.]

[20-203.

A person may not operate any abortion referral service unless the service is registered with the Department.]

[20-204.

A person who engages in any abortion referral service may not accept, solicit, or divide any fee received by a physician, hospital, health-related facility, or dispensary that performs or induces an abortion on any individual brought, recommended, or referred to that physician, hospital, health-related facility, or dispensary.]

[20-205.

The Department shall adopt rules and regulations for abortion referral services, including medical standards and guidelines for referral procedure and training for the staff.]

[20-206.

A person who violates any provision of Part I of this subtitle is guilty of a misdemeanor and on conviction is subject to a fine not exceeding \$5,000 or imprisonment not exceeding 1 year or both.]

[20-208.

- (a) No person shall terminate or attempt to terminate or assist in the termination or attempt at termination of a human pregnancy otherwise than by birth, except that a physician licensed by the State of Maryland may terminate a human pregnancy or aid or assist or attempt a termination of a human pregnancy if said termination takes place in a hospital accredited by the Joint Commission for Accreditation of Hospitals and licensed by the State Board of Health and Mental Hygiene and if one or more of the following conditions exist:
- (1) Continuation of the pregnancy is likely to result in the death of the mother;
  - (2) There is a substantial risk that continuation of the pregnancy would gravely impair the physical or mental health of the mother;
  - (3) There is substantial risk of the birth of the child with grave and permanent physical deformity or mental retardation;
  - (4) The pregnancy resulted from a rape committed as a result of force or bodily harm or threat of force or bodily harm and the State's Attorney of Baltimore City or the county in which the rape occurred has informed the hospital abortion review authority in writing over his signature that there is probable cause to believe that the alleged rape did occur.
- (b) In no event shall any physician terminate or attempt to terminate or assist in the termination or attempt at termination of a human pregnancy otherwise than by birth unless all of the following conditions exist:
- (1) Not more than twenty-six weeks of gestation have passed (except in the case of a termination pursuant to subsection (a)(1) or where the fetus is dead); and
  - (2) Authorization therefor has been granted in writing by a hospital abortion review authority appointed by the hospital.
- (c) The hospital abortion review authority shall keep written records of all requests for authorization and its action thereon. An annual report of the therapeutic abortions performed in Maryland shall be made by the director of the hospital and its governing board. Such reports shall include the number of requests, authorizations and performances, the grounds upon which such authorizations were granted, and the procedures employed to cause the abortions and such reports shall be forwarded to the Joint Commission on Accreditation of Hospitals and the State Board of Health and Mental Hygiene for the purpose of

insuring that adequate and proper procedures are being followed in accredited hospitals. Such information, which is not subject to the physician-patient privilege, may be made available to the public. Said reports shall not include the names of the patients aborted.]

**Part II. Abortion [Restrictions] PROCEDURES**

20-208.

AN ABORTION MUST BE PERFORMED BY A LICENSED PHYSICIAN.

20-209.

(A) IN THIS SECTION, "VIALE" MEANS THAT STAGE WHEN, IN THE BEST MEDICAL JUDGMENT OF THE ATTENDING PHYSICIAN BASED ON THE PARTICULAR FACTS OF THE CASE BEFORE THE PHYSICIAN, THERE IS A REASONABLE LIKELIHOOD OF THE FETUS'S SUSTAINED SURVIVAL OUTSIDE THE WOMB.

(B) EXCEPT AS OTHERWISE PROVIDED IN THIS SUBTITLE, THE STATE MAY NOT INTERFERE WITH THE DECISION OF A WOMAN TO TERMINATE A PREGNANCY:

(1) BEFORE THE FETUS IS VIALE; OR  
(2) AT ANY TIME DURING THE WOMAN'S PREGNANCY, IF:

(I) THE TERMINATION PROCEDURE IS NECESSARY TO PROTECT THE LIFE OR HEALTH OF THE WOMAN; OR

(II) THE FETUS IS AFFECTED BY GENETIC DEFECT OR SERIOUS DEFORMITY OR ABNORMALITY.

(C) THE DEPARTMENT MAY ADOPT REGULATIONS THAT:

(1) ARE BOTH NECESSARY AND THE LEAST INTRUSIVE METHOD TO PROTECT THE LIFE OR HEALTH OF THE WOMAN; AND

(2) ARE NOT INCONSISTENT WITH ESTABLISHED MEDICAL PRACTICE.

(D) THE PHYSICIAN IS NOT LIABLE FOR CIVIL DAMAGES OR SUBJECT TO A CRIMINAL PENALTY FOR A DECISION TO PERFORM AN ABORTION UNDER THIS SECTION MADE IN GOOD FAITH AND IN THE PHYSICIAN'S BEST MEDICAL JUDGMENT *IN ACCORDANCE WITH ACCEPTED STANDARDS OF MEDICAL PRACTICE.*

[20-210.

(a) A person is guilty of a misdemeanor if the person:

CAPITALS INDICATE MATTER ADDED TO EXISTING LAW.

[Brackets] indicate matter deleted from existing law.

*Italics* indicate amendments to bill.

(1) Sells or gives, or causes to be sold or given, any drug, medicine, preparation, instrument, or device for the purpose of causing, inducing, or obtaining a termination of human pregnancy other than by a licensed physician in a hospital accredited by the Joint Commission for Accreditation of Hospitals and licensed by the State Board of Health and Mental Hygiene; or

(2) Gives advice, counsel, or information for the purpose of causing, inducing, or obtaining a termination of human pregnancy other than by such physician in such a hospital; or

(3) Knowingly assists or causes by any means whatsoever the obtaining or performing of a termination of human pregnancy other than by such physician in such a hospital.

(b) Any person who violates any provision of this section, upon conviction, is subject to a fine of not more than five thousand dollars for each offense, or to imprisonment for not more than three years, or both such fine and imprisonment. The penalties in this section are in addition to and not in substitution for any other penalty or penalties applicable to particular classes of persons under other laws of this State.]

[20-211.

(a) This section does not apply if the attending physician certifies that an abortion is necessary to save the life of the woman.

(b) Before a physician performs an abortion, the woman undergoing the procedure shall be advised of the extent to which:

(1) Financial and other material assistance to carry the pregnancy to a normal delivery is available;

(2) Financial and other material assistance to raise and support her child is available; and

(3) Assistance from a licensed and regulated adoption agency is available if she chooses not to keep the baby.

(c) In cooperation with the Department of Health and Mental Hygiene, the Department of Human Resources shall prepare annually, periodically update, and publish a list of federal, State, and private sources of the types and extent of assistance referred to in subsection (b) of this section, and shall distribute this published information to each hospital, clinic, physician's office, and other facility where an abortion is performed.

(d) The signed document, of a woman who seeks an abortion, indicating that she has been counseled concerning the published information referred to in subsection (c) of this section is evidence that the requisite information was given

~~Strike out~~ indicates matter stricken from the bill by amendment or deleted from the law by amendment.

to the woman. The signed document shall become part of the medical record.

- (e) A person who willfully violates any provision of subsection (b) of this section is guilty of a misdemeanor and on conviction is subject to a fine of not more than \$500.]

**Part IV. Effect of Refusal to Participate [or Refer]**

20-214.

- (a) (1) A person may not be required to perform or participate in [, or refer to any source for,] any medical procedure that results in artificial insemination, sterilization, or termination of pregnancy.
- (2) The refusal of a person to perform or participate in [, or refer to a source for,] these medical procedures may not be a basis for:
- (i) Civil liability to another person; or
- (ii) Disciplinary or other recriminatory action against the person.
- (b) (1) A licensed hospital, hospital director, or hospital governing board may not be required[:
- (i) To] TO permit, within the hospital, the performance of any medical procedure that results in artificial insemination, sterilization, or termination of pregnancy[; or
- (ii) To refer to any source for these medical procedures].
- (2) The refusal to permit [or to refer to a source for] these procedures may not be grounds for:
- (i) Civil liability to another person; or
- (ii) Disciplinary or other recriminatory action against the person by this State or any person.
- (c) (1) The refusal of an individual to submit to or give consent for an abortion or sterilization may not be grounds for loss of any privileges or immunities to which the individual otherwise would be entitled.
- (2) Submitting to or granting consent for an abortion or sterilization may not be a condition precedent to the receipt of any public benefits.
- (D) A PERSON WHO IS NOT A HEALTH CARE PROVIDER LICENSED OR OTHERWISE AUTHORIZED TO PROVIDE HEALTH CARE UNDER THE HEALTH OCCUPATIONS ARTICLE IS NOT REQUIRED TO REFER AN INDIVIDUAL TO ANY PERSON FOR ANY MEDICAL PROCEDURE THAT RESULTS IN ARTIFICIAL INSEMINATION, STERILIZATION, OR TERMINATION OF PREGNANCY.

**Article - Health Occupations**

14-404.

- (a) Subject to the hearing provision of §14-405 of this subtitle, the Board, on the affirmative vote of

a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

- (23) [Performs an abortion outside a licensed hospital;
- (24)] Willfully submits false statements to collect fees for which services are not provided;
- [(25)] (24) Was subject to investigation or disciplinary action by a licensing or disciplinary authority or by a court of any state or country for an act that would be grounds for disciplinary action under this section and the licensee:
- (i) Surrendered the license issued by the state or country to the state or country; or
- (ii) Allowed the license issued by the state or country to expire or lapse;
- [(26)] (25) Knowingly fails to report suspected child abuse in violation of §5-704 of the Family Law Article;
- [(27)] (26) Fails to educate a patient being treated for breast cancer of alternative methods of treatment as required by §20-113 of the Health - General Article;
- [(28)] (27) Sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes;
- [(29)] (28) Fails to comply with the provisions of §12-102 of this article; or
- [(30)] (29) Refuses, withholds from, denies, or discriminates against an individual with regard to the provision of professional services for which the licensee is licensed and qualified to render because the individual is HIV positive.

**SECTION 2. AND BE IT FURTHER ENACTED.**

That if any provision of this Act or the application thereof to any person or circumstance is held invalid for any reason in a court of competent jurisdiction, the invalidity does not affect other provisions or any other application of this Act which can be given effect without the invalid provision or application, and for this purpose the provisions of this Act are declared severable.

**SECTION 3. AND BE IF FURTHER ENACTED,** *That if any portion of the amendments to §20-103 of the Health - General Article made by this Act is petitioned to referendum and rejected by the voters, such rejection does not affect other provisions of this Act and the remaining provisions shall be given effect unless they too are petitioned to referendum and rejected by the voters.*

**SECTION 3. 4. AND BE IT FURTHER ENACTED,** That this Act shall take effect July 1, 1991. ■

CAPITALS INDICATE MATTER ADDED TO EXISTING LAW.  
[Brackets] indicate matter deleted from existing law.  
*Italics* indicate amendments to bill.

~~Strike out~~ indicates matter stricken from the bill by amendment or deleted from the law by amendment.

# COMMITTED TO EXCELLENCE

*Roche  
Laboratories  
presents the  
winners of  
the 1990*

Please join us in honoring these outstanding Roche sales representatives who have distinguished themselves by a truly exceptional level of professionalism, performance and dedication to quality health care.

Throughout the year, each of these award-winning individuals has consistently exemplified the Roche Commitment to Excellence, and we're proud to invite you to share in congratulating them on their achievement.

Clifford R. Crown

Ronald C. Hardnock

Henry C. Shimonkevitz

# COMMITTED TO TOTAL HEALTH CARE

*Roche  
Laboratories  
presents the  
resource library  
for patient  
information*

## ROCHE ME MEDICATION EDUCATION

Your Roche representative offers you access – without expense or obligation – to a comprehensive library of patient information booklets designed to supplement rather than supplant your rapport with your patients.

Each booklet helps you provide...

- Reinforcement of your instructions
- Enhancement of compliance
- Satisfaction with office visits

Your Roche representative will be happy to provide a complete catalog of available booklets and complimentary supplies of those that are applicable to your practice.

## J. David Nagel MD, Med Chi President 1991-1992

**Betsy Newman**

*Betsy Newman is Director of the Public Relations Department for the Medical and Chirurgical Faculty of Maryland.*

---

*"I think it's a privilege to be a physician. I don't know of anything else in this world I'd rather do."*

---

Among the piles of paperwork and patient folders scattered throughout Dr. J. David Nagel's Lutherville office are some of his most prized possessions -- photographs of his wife and children, a medical school diploma, and two inch-high fuzzy bears. One of them, the "doctor bear," came from Genevieve, a diabetic patient whose leg he saved from amputation. The other, "leprechaun bear," is from Gertrude, a patient he helped both physically and psychologically to a full recovery. To Dr. Nagel, the bears not only represent two of his most gratifying medical achievements but they also symbolize what is most important to him and his practice: his patients.

"I think it's a privilege to be a physician," he grins broadly while pointing out that many of the pictures on his walls were framed by another of his esteemed patients. "I don't know of anything else in this world I'd rather do."

But Dr. Nagel did not always aspire to be a physician. "As a child, I wanted to be a cabdriver," he says, but his father insisted on medical school. "My father was a doctor, my uncle was a doctor, and all firstborn sons in my family were expected to become doctors, so tradition prevailed."

Looking back, Dr. Nagel realizes he never really thought about a career until after he enrolled at the University of Maryland School of Medicine. "I didn't like it," he recalls. "The classes were difficult and I nearly flunked out my freshman year." Not until the middle of his second year, after getting involved with courses that had clinical applications such as pathology, did Dr. Nagel begin to flourish. After graduating in 1964, he served his internship and residency at Mercy Hospital where he became Chief Resident in Medicine in 1967. Later, he became the first person in his graduating medical school class to pass his boards in Internal Medicine.

Almost immediately, Dr. Nagel set up a private practice in Towson with his partner, E. Lee Robbins MD, a friend and fellow graduate of Mercy's training program. After sharing twenty-three years of practice, the two partners now have an office proudly adorned with patient memorabilia.

## Med Chi Communications

As President, he looks forward to spreading his message throughout the State by traveling to Med Chi's component medical societies. Regional meetings were initiated three years ago in an effort to improve Med Chi communications. Med Chi presidents now travel to western, eastern, and southern Maryland to visit with area physicians and hear regional concerns. Dr. Nagel is anxious to continue this tradition and desires to bring more medical society issues to rural areas. "In the last few years, I think the leadership of Med Chi has become aware of a shifting of emphasis away from large metropolitan issues toward more suburban and rural physician needs. I predict places like Harford, Carroll, and Howard County will exper-

ience growth over the next decade for Maryland physicians."

Dr. Nagel hopes his visits to county medical societies will help more physicians keep up-to-date on important medical issues. In order to accurately represent the views of all Med Chi members, Dr. Nagel believes physicians must attend component medical society meetings and express their opinions. "Organized medicine is the physician's negotiating arm," he says. "Input from the membership is essential in order for Med Chi to take a proactive stance."

Taking a proactive stance on medical issues, especially those in the General Assembly, is another goal Dr. Nagel aspires to achieve as Med Chi President. "Rather than only working to water-down proposed regulations or trying to defeat bills," he contends, "Med Chi should introduce more legislation to reflect the viewpoint of Maryland physicians."

## AIDS

AIDS was one issue Med Chi took an active position on in the General Assembly this year. Med Chi's Committee on AIDS and Legislative Committee, with the assistance of Med Chi's legal counsel, drafted legislation that would assure the protection of health care workers exposed to the human immunodeficiency virus (HIV). The legislation was eventually introduced during the 1991 session by Senator Nancy Murphy as Senate Bill 156. In support of Med Chi's assertive stance on AIDS, Dr. Nagel adds his view that all patients should be tested upon their admission to a hospital. "If an HIV patient comes into a hospital and if there's going to be exposure to blood and blood products, I think it's very important we know about it to help prevent the spread of the disease to other health care workers and to other patients."

## The Physician/Patient Relationship

During his term as Med Chi President, Dr. Nagel looks forward to relating his grassroots patient-relations philosophy to other Maryland physicians. "Unfortunately, the economics of medicine has substantially affected professionalism in medicine," he says, and explains that the increasing emphasis on cutting costs by the government and insurance companies has put tremendous stresses on the physician/patient relationship. Economics is building a brick wall separating physicians and patients, according to Dr. Nagel. To break through this wall, he says, physicians must spend more time with their patients, thoroughly explaining their diagnoses and treatments, and then, give that little extra to preserve the physician/patient relationship. "Patients entrust their physicians with their lives. As a doctor, it's your responsibility to provide for your patients regardless of whether or not they have the money to pay for it." Physicians do more than provide a service for a fee, they give of themselves, which can never be measured in dollars and cents.

Quality, affordable health care should be the primary goal of organized medicine, maintains Dr. Nagel, who admits his commitment to this ideal drove him to seek the office of President. "Physicians may argue about their political and philosophical differences but we all have one vital trait in common: we are practicing physicians. The medical society brings us all together in a unity of purpose. We're a society of doctors and when we scrape away all the bureaucratic nonsense, we get down to what's really important: quality care for the patient and preserving professionalism. On that fact we all agree."

## Physician Ownership

Another issue in the Maryland legislature this year was physician ownership of laboratories. Dr. Nagel concurs with the American Medical Association's opinion that physicians should disclose their financial interests in for-profit health facilities to their patients. He is vehemently opposed to any government regulations designed to prevent physicians from referring patients to these facilities because such a law would adversely affect patients. In rural areas, for example, there is often only one medical laboratory. If a law restricting physician referral was passed, physicians with a financial investment in this laboratory would be forced to refer their patients to other facilities. As a result, patients would travel longer distances for medical tests, wait longer for test results and, ultimately, pay more for their medical care.

## Government Regulation of Medicine

He expresses his regret that the majority of physicians are suffocating under "mounds of regulations" because of the failings of a few. As an example, he describes another proposed regulation at the federal level that would monitor and restrict physician gifts from drug companies in order to regulate doctors who abuse prescribing practices. In his opinion, these types of regulation hinder physicians more than they help protect patients. "I'm wary of too many ethical guidelines from the government," asserts Dr. Nagel.

How many regulations can physicians tolerate before the regulations influence patient care? Dr. Nagel opposes any government proposals that would lead to rationing of care. "We've already agreed that we're going to care for the over sixty-five population for a lower price than others," admits Dr. Nagel, who feels the Medicare system is the first step toward a national fee schedule for physicians. "I'm concerned because Medicare and the intervention of many health insurance programs mandate a certain type of practice. They place restrictions on the kind and amount of medical care you can give... But there is no way to write down on a prescription pad or have a computer analyze the benefit of seeing a patient one more time in terms of his or her overall health."

## Physician Payment Systems and Health Access America

Dr. Nagel concedes that the Medicare program needs some sort of fee structure, such as the proposed Resource-Based Relative Value Scale (RBRVS). However, he is "totally against" profile systems used by insurance companies that are not based

on objective criteria. He purports, "There's no reason why a doctor who's been in practice ten years and a doctor who's been seeing patients for twenty years should get paid a different sum of money for doing exactly the same procedure." To assure equity in any payment system, Dr. Nagel insists that organized medicine act as an intermediary, negotiating the fundamental elements of the economics of medicine while also advocating for patients.

Dr. Nagel believes the American Medical Association (AMA) has succeeded in influencing this medical economics debate through its leadership role in developing Health Access America. This proposal to improve access to affordable, quality health care was developed in response to Canadian-style health care and national health insurance proposals. Health Access America is unique because it builds upon the current strengths of our medical system while increasing access to the more than thirty million Americans who lack health insurance. Dr. Nagel agrees with the basic premise of the proposal -- that all Americans need access to affordable, quality health care -- and hopes that Med Chi can take an active part in future steps toward realizing the sixteen points of the Health Access America proposal.

## Practice Parameters

One of these sixteen points encourages the development of professional practice parameters in order to assure that only appropriate, high quality medical services are provided, thus lowering costs and maintaining quality care. Dr. Nagel thinks practice parameters can be a way for physicians to "refine" procedures learned in medical school and sees them as measuring sticks to be used as guides for medical treatment protocols that are not clear in all respects.

If used in this way, Dr. Nagel believes parameters could end many of the "defensive medicine" practices physicians use to avoid liability actions. Moreover,

parameters could be employed to detect physicians who abuse the system through gross and willful overutilization of resources. "Overutilization is more than defensive medicine," he states, "it's prescribing a second CAT-scan when only one is necessary, or ordering a blood sugar count for the same patient every day." Dr. Nagel blames overutilization of resources for helping drive up health care costs and believes that physicians guilty of willful overutilization should be subject to disciplinary measures.

### Liability Insurance and Tort Reform

Ideally, Dr. Nagel views practice parameters as a means to obviate the use of physicians as expert witnesses in malpractice cases. "Currently, most decisions in malpractice cases are based on a physician's ability to communicate," he says. "Many jurors look at the doctor testifying and think, 'He looks like he's telling the truth,' and then vote in his favor. If you have basic practice parameters, jurors can decide on guilt or innocence based on whether the physician adhered to predetermined guidelines."

If practice parameters are used in court, Dr. Nagel foresees fewer malpractice suits and lower liability insurance rates for physicians.

Dr. Nagel acknowledges Med Chi's efforts to improve the liability situation in Maryland as outstanding. "I think the ability to frivolously sue a physician is pretty well wiped out," he professes. "Med Chi has vigorously pursued relief from the high cost of liability insurance by working with regulators and insurance companies. We also are aware of the emotional impact of a suit and have established support systems for our members."

### Future of Med Chi

Med Chi upholds high quality medical care in Maryland, states Dr. Nagel, who wishes to initiate a

plan to help Med Chi run even more efficiently during his term in office. As President, he intends to propose a new leadership structure for Med Chi, similar in form to the AMA Board of Trustees. In this reorganization, the members of the Med Chi "Board of Trustees" (or the current Executive Committee) would be appointed for three-year terms. Each officer would be elected by the House of Delegates. According to Dr. Nagel, this new leadership structure would help Med Chi politically because members would not be faced with electing several new officers each year. It would also simplify many administrative matters complicated by the annual shuffle resulting from a change in officers. Dr. Nagel hopes his plan will be accepted by other Med Chi members and looks forward to input. "I don't have all the answers but longevity in leadership is important."

When asked about other goals during his term, Dr. Nagel replies, "I intend to say what I think... and I'm not afraid to ask the hard questions. In fact, I usually do ask the hard questions."

### Activities in Organized Medicine

Dr. Nagel first began to ask those hard questions and earn his peers' respect when he was elected to the Medical Executive Committee for Mercy Hospital in 1972. Three years later, he sought the office of Secretary/Treasurer of the medical staff at Franklin Square Hospital. He progressed on to the office of Vice President and ultimately became President of the medical staff in 1979.

Although a member of Med Chi since graduating medical school in 1964, Dr. Nagel became an active participant in organized medicine in 1979 when he was elected to the Baltimore County Medical Association's (BCMA) Board of Governors in 1979. In 1981, while serving as Medical Staff Representative to the Franklin Square Hospital Board, he also became Secretary to the BCMA. He later advanced to Vice President (1982), President-elect (1983), and President (1984) of the BCMA. He served as Chairperson for the BCMA Board of Governors in 1985. He was also a member of the BCMA's Peer Review Committee from 1978 to 1980 and the BCMA's Ethics Committee in 1986.

Dr. Nagel first became involved with Med Chi when he served as Chairperson of the Med Chi Committee on Hospital Medical Staffs in 1983. The following year, he was elected to the Med Chi Council where he served as Vice Chairperson in 1987 and Chairperson in 1989.

While on the Med Chi Executive Committee (1987), Dr. Nagel earned a reputation for speaking out and was selected as an alternate delegate to the AMA in 1989. In 1990, he was nominated and won the office of Presi-

dent-elect. He will be inaugurated as President on May 10, 1991 during the House of Delegates session at the Annual Meeting in College Park, Maryland.

### Family Life

"My goals for the future? Well, I'd like to lose about ten pounds, maybe get to exercise a bit more," quips Dr. Nagel. Hopefully my experience with organized medicine will help me in future endeavors. I enjoy dealing with issues of planning and mediation and I think I do better with creative activities rather than day-to-day management. I am proud to be part of the growth that has occurred in Med Chi over the past few years and have learned that success is not an accidental phenomenon. In 1983, when I first met Dr. James Todd, Executive Vice President of the AMA, he told me what his father told him, "Plan your work, and work at your plan." So to answer your question, I am in the planning stage now and one thing for sure, my plans include more time with my wife, Dianne, and my daughters, Jenny (25), Missy (22), and Carrie (15), as well as good friends who have been so supportive over the years. Dianne, a nursing graduate of the University of Maryland, currently works as Director of Utilization Review for Sheppard and Enoch Pratt Hospital. The Nagels and daughter Carrie live in scenic Butler. Born and raised in Baltimore County, Dr. Nagel admits, "I have an affinity for Baltimore County and for this State. Maryland's a great place to live."

### Goals for Maryland Medicine

As for the future of Maryland medicine, Dr. Nagel is ready for anything. "I'm committed to my Society and committed to what I think is right." And as for the future of American medicine, Dr. Nagel quotes President Bush: "He once said 'Put us on a level playing field and we can outperform and outproduce any country in the world.' I say the same thing about American medicine. We can and will outperform any medical system in the world." ■

# MRI UPDATE

Figure 1

Figure 2

**CLINICAL HISTORY:** This is a 26-year-old male with back pain and right lower extremity radiation.

**FINDINGS:** This is an example of a normal study on a young adult. **COMMENT:** MRI is the screening test of first choice for suspected disorders of the lumbar spine. Notice the clear depiction of the normal L5-S1 disc (figure 1, crossed arrow). The discs of this patient exhibit high signal intensity reflecting normal hydration and none of the discs are narrowed. None of the discs indent the thecal sac which is of intermediate signal intensity and appears as the gray band in the center

of the image. The vertebral bodies are homogeneous and free of destructive lesions. The conus medullaris (arrow) is normal. This sagittal image demonstrates the advantages of MRI over other screening modalities. Routine CT scanning will not display the conus medullaris, lesions of which may masquerade as disc herniation. The general area of coverage is superior with MRI. Disc detail is much better displayed with MRI.

The axial image at L5-S1 (figure 2) exhibits delineation of intraspinal detail far superior to that of CT. The right S1 nerve root is clearly displayed (arrow) surrounded by normal perineural fat

which is the bright high intensity material in the periphery of the spinal canal. State-of-the-art MR images clearly display the bony anatomy of the lumbar spine including the facet joints (crossed arrow). Degenerative diseases and bony neoplasm are routinely detectable.

MRI involves no ionizing radiation and no intrathecal contrast material is needed. It is a patient-friendly outpatient examination well suited for screening purposes.

## Because Life Should Be Worth Living.

It used to be that when patients with a serious or demanding illness were sent home from the hospital, in effect, they were being sent home to die. Today, we are sending them home to live.

Caremark is assisting these people—children, young mothers and fathers, working people in the prime of their lives, as well as the elderly—to keep the rhythm of their lives intact by providing them home infusion services with more clinical expertise and personal commitment than any other company.

A commitment to clinical treatment that enhances the quality of your patient's life. An easy referral process. Complete, autonomous service centers. Timely clinical feedback for you and psychosocial support for your patient.

And we're more than a company. Caremark is people who thrive on giving others hope, dignity, respect and an extended family for support.

With unwavering conviction, we value the principle that, regardless of disease state or condition, life should be worth living.

# P.I.E.'s quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. P.I.E. Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

## **QRP FACTS:**

**Strict Underwriting Criteria** — Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

## **Scheduled Premium Reductions** —

Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

**High Limits** — Backed by our reinsurer, Lloyd's of London, P.I.E. is able to offer higher coverage limits for qualifying doctors: up to

\$7 million for individual doctors and \$13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

**Designed With Input from Doctors** — P.I.E.'s QRP plan is an innovative modified claims-made insurance specially designed with input from P.I.E.-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your P.I.E. representative, or our headquarters office today.

# Large Valvular Vegetations in Infective Endocarditis

Robert Dart MD and Wilson Gomer MD

*Dr. Dart is an internist in private practice in Baltimore, MD. Dr. Gomer was formerly a resident at Harbor Hospital Center, Baltimore, MD.*

---

*Patients with vegetations demonstrable by echocardiography tend to have more complications and a worse prognosis than patients without echo-demonstrated vegetations.*

---

Heart valve vegetation is the hallmark of bacterial endocarditis and can be demonstrated by echocardiography in a large percentage of cases (40 to 80 percent).<sup>1</sup> Patients with vegetations demonstrable by echocardiography tend to have more complications and worse prognosis than patients without echo-demonstrated vegetations.<sup>2-9</sup>

There is additional, albeit controversial, evidence that large vegetations are associated with poorer outcomes than small vegetations.<sup>2,4,10,11</sup> We report on a recent case of bacterial endocarditis with a massive valvular vegetation which illustrates many of the characteristic features of large vegetations identified by our literature review.

## Case Presentation

This was the first admission to our hospital for a thirty-year-old male with back pain of three days duration. He had a medical history of intravenous drug use but had otherwise been in excellent health until three days earlier when he experienced the onset of right shoulder and back pain. He was seen in the emergency room and sent home with analgesics, only to return three days later with worsening pain, chest tightness, and dizziness. He had no fever or chills. He had a moderate cigarette and alcohol habit, and was employed as a trash collector. He was a robust male in moderate distress secondary to pain. His temperature was 96.9° F, his pulse was 140 per minute, respirations were 24 per minute, and his blood pressure was 86/53 mm Hg. Positive findings were limited to a low grade systolic murmur along the right sternal border.

The urine was positive for bilirubin, protein, nitrites, blood and leukocytes, and contained moderate white cells, red cells, granular casts, and a few bacteria. His white blood count was 12,300 with no left shift, hematocrit was 40.7, and platelet count was 55,000. Abnormal chemistries included a sodium of 129 mEq/l, urea nitrogen of 68 mg/dl, creatinine of 2.7 mg/dl, total bilirubin of 3.9 mg/dl, direct bilirubin of 3.4 mg/dl, alkaline phosphatase of 230 u/l, serum glutamic-oxaloacetic transaminase (SGOT) of 230 u/l, and

serum glutamic-pyruvic transaminase (SGPT) of 108 u/l. An electrocardiogram (ECG) showed sinus tachycardia at a rate of 144, as well as right bundle branch block. Chest x-ray (Figure 1) showed a small right pleural effusion and diffuse infiltrates involving subsegments of the right lower lobe. Room air arterial blood gas showed a hydrogen ion concentration (pH) of 7.44, a partial carbon dioxide pressure (pCO<sub>2</sub>) of 24, an oxygen partial pressure (pO<sub>2</sub>) of 60, and a bicarbonate (HCO<sub>3</sub>) of 19.

The patient was admitted to the intensive care unit (ICU). On the first hospital day, his temperature started to rise. After blood and urine cultures were obtained, he was started on a third generation cephalosporin and trimethoprim-sulfamethoxazole. He underwent thoracentesis; pleural fluid smear showed gram positive cocci and the antibiotic coverage was changed to vancomycin and gentamicin. On the second hospital day, the patient was placed on mechanical ventilation due to severe hypoxemia. Blood cultures grew *Staphylococcus aureus* and alpha Streptococcus. *Staphylococcus aureus* also was cultured from the pleural fluid.

An M-Mode and 2-D echocardiogram (Figures 2 and 3) showed a huge vegetation on the anterior leaflet of the tricuspid valve measuring 5.45 cm in diameter, and moderately severe tricuspid insufficiency. A repeat echocardiogram five days later showed a vegetation that was much reduced in size (Figure 4).

A human immunodeficiency virus (HIV) antibody test was positive. On the fourth hospital day, bilateral infiltrates were noted on chest x-ray. His unstable

condition precluded transfer to another hospital for surgery. The infiltrates worsened and progressed to acute respiratory distress syndrome (ARDS) (Figure 5). His worsening respiratory failure was accompanied by renal failure and he died on the twelfth hospital day.

Figure 2. An M-Mode echocardiogram showing large vegetation. (Shown at V.)

Figure 3. A 2-D echocardiogram showing a 5.4 cm vegetation. (Shown at arrows (→).)

Figure 4. A repeat echocardiogram showing a vegetation much reduced in size. (Shown at arrows (→).)

Figure 1. Chest x-ray showing a small right pleural effusion and diffuse infiltrates involving subsegments of the right lower lobe.

**Figure 5.** Bilateral infiltrates worsened and progressed to ARDS.

## Discussion

Echocardiography is considered the technique of choice in demonstrating vegetations in bacterial endocarditis. It is sensitive in detecting vegetations as small as 2 mm.<sup>12</sup> Valvular vegetations are considered large if they are greater than 1 cm, and studies have reported vegetations as large as 5 cm in longest diameter.<sup>13</sup>

Various studies have been conducted to determine whether the presence of a vegetation or its size have any impact on the organism cultured, the valve involved, the complication rate, or the need for surgery.

**Organism cultured.** Classically, large vegetations are associated with fungal endocarditis.<sup>14,15</sup> However, fungal endocarditis is such a rare entity, that while fungal endocarditis may be associated with large vegetations, most large vegetations are not fungal.<sup>4</sup>

In most studies, vegetation size was not important in predicting the organism involved.<sup>4,5,9,16</sup> Patients with large vegetations were infected with the same organisms as patients with small vegetations. Robbins et al found that *Staphylococcus aureus* and streptococcus were the first and second most common organisms in patients with large vegetations, and that Streptococcus was the most common organism in patients with small vegetations.<sup>10</sup> In addition, Takeda et al found that *Staphylococcus aureus* was the most common organism in patients with any vegetation, regardless of size.<sup>6</sup>

But staphylococcus and streptococcus are the most prevalent organisms cultured in all cases of endocarditis. Customarily, the patient population has been more important in predicting the infecting organism, as, for example, in the propensity of intravenous drug users toward acquiring highly virulent *Staphylococcus aureus* infections.

**Valve involved.** The tricuspid is the valve most commonly infected with endocarditis from intravenous

drug use.<sup>16</sup> Most studies show that vegetations on this valve tend to be larger than on the mitral or aortic valves; the pulmonic valve is rarely affected.<sup>5,9,16,17</sup> This may be because the annular circumference of the tricuspid valve is larger than that of the mitral, and thus the vegetation has more room to grow. In addition, the systolic pressure in the right ventricle is lower than that in the left ventricle.<sup>17</sup> Despite the larger size, vegetations on the tricuspid valve are associated with less morbidity and mortality than left-sided vegetations.<sup>2,5,16</sup>

**Complications.** Most studies support evidence that the presence of an echo-demonstrated vegetation is associated with at least a two-fold higher incidence of complications, including congestive heart failure, systemic emboli, failure of medical therapy requiring surgical intervention, and death.<sup>2-9</sup> Such data underscore the importance of echocardiography in identifying a high-risk group that would benefit from early surgery.

Whether large vegetations cause more complications than small vegetations is controversial and results are mixed. Congestive heart failure (CHF) is the most common serious complication of patients with echo-demonstrated endocarditis and the leading cause of death.<sup>18</sup> It is usually caused by destruction of the valve by a vegetation and invariably heralds the need for surgery.<sup>5</sup> Since the vegetation is the instigator of the injury, it is not surprising that studies have shown an association between the presence of vegetations and the development of CHF,<sup>5,6</sup> and between large vegetations and CHF.<sup>2,4</sup> Other studies, on the other hand, have found no association between vegetation size and CHF.<sup>9</sup>

Before antibiotics were available, the incidence of emboli in endocarditis was as high as 80 percent, but current embolic rates are 15 to 30 percent.<sup>5</sup> The four principal sites of embolization are the brain, spleen, coronary arteries, and kidneys, but other sites may also be affected.<sup>18</sup> Roberts et al, for example, discovered acute pneumonia to be a dominant clinical feature of patients with vegetations demonstrated by echocardiography, and concluded that it was secondary to embolization from a right-sided vegetation.<sup>13</sup>

Because embolization occurs as friable pieces of vegetations separate and are propelled into the circulation,<sup>19</sup> it is hardly surprising that many studies demonstrate an increased incidence of embolic events among patients with echo-documented vegetations.<sup>5-7,9</sup> While Nasser et al found that large vegetations were associated with multiple emboli,<sup>7</sup> and Mugge et al found that patients with large vegetations had an increased incidence of emboli,<sup>9</sup> others found that vegetation size was not important in predicting embolization.<sup>2,4,5</sup>

**Treatment.** If vegetations in general, and large vegetations in particular, cause more complications, it follows that they would be associated with more medical failures and, thus, more need for surgery.<sup>16</sup> In fact, patients with large vegetations and non-streptococcus infections will rarely be cured by antibiotics alone,<sup>10,11</sup> and frequently require surgery.<sup>2,4,8</sup> The mortality rate

for surgery is high, particularly if the surgery is delayed because preoperative organ failure occurs during medical treatment. Some investigators advocate early surgery for patients with echo-demonstrated vegetations who are at risk for major complications, before irreversible organ damage occurs.<sup>3</sup>

*"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."*

Theodore C. Patterson, M.D., Medical Director,  
Meridian Nursing Center—Heritage

#### **Partners in Healthcare**

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—  
The Professional Choice.

# Rocky Mountain Spotted Fever: Often a Diagnostic Dilemma

---

Christopher deBorja MD and Victor R. Hrehorovich MD

---

*Dr. deBorja is a member of the house staff and Dr. Hrehorovich is the Director of the Department of Medicine, Harbor Hospital Center, Baltimore, MD.*

---

*Prompt treatment with tetracycline or chloramphenicol is the single most important therapeutic intervention in patients diagnosed with Rocky Mountain spotted fever.*

---

**R**ocky Mountain spotted fever (RMSF) was first described as a tick-borne illness in 1906 by Howard Ricketts who was doing research in Montana. He died in 1910 of typhus, succumbing to the genus that bears his name. The *Rickettsia rickettsii* is a .2 x .2 x .3 micron, obligate intracellular parasite, containing both deoxyribonucleic acid (DNA) and ribonucleic acid (RNA). Intracellular proliferation can occur in both the nucleus and cytoplasm.<sup>1</sup> The disease most commonly occurs from April to October. In 1981, there were 1,170 cases of RMSF reported to the Centers for Disease Control (CDC). This has decreased to 603 cases in 1989, with an incidence of 0.25 per 100,000 persons. The state having the greatest number of cases in 1989 was North Carolina with 118. Maryland had only one CDC-reported case in that year. The greatest increase from the previous year occurred in New Jersey and Pennsylvania. Males made up 63 percent of the cases; 58 percent of the cases had had a positive tick exposure within fourteen days of symptoms. The triad of fever, headache, and rash was found in 49 percent of the cases. The case fatality rate was highest in those over twenty years of age (1.5 percent).<sup>2</sup> The overall low incidence of the disease and the often atypical presentations provide an interesting diagnostic and therapeutic dilemma.

## Case Presentation

This was the first Harbor Hospital Center admission for this sixty-eight-year-old white female complaining of fever of one-week's duration. The patient had a past medical history significant for right leg embolectomy secondary to an automobile accident, and a dilation and curettage (D&C). The patient stated that she had been in her baseline state of health until approximately one week prior to admission, when she began experiencing "off and on" fever, weakness, and loss of appetite. These symptoms continued for the next several days with increasing weakness and occasional dizziness. She denied cough, sweats, chills, abdominal pain, nausea, vomiting, diarrhea, headache, photophobia, arthralgias, myalgias, stiff neck, dysuria, pyuria, or rashes. It was noted

that her granddaughter, with whom she lived, had been admitted to this hospital one day earlier for possible RMSF with a positive tick exposure.

There were no preadmission medications used, nor allergies described. The patient had been widowed two years previously and lived with her son and granddaughter in a wooded rural area. The family had numerous pets who had the run of the property. The patient denied any recent tick bite or infestation. She was a retired cleaning lady without an alcohol or tobacco history. Her family history was significant only for diabetes mellitus in her mother.

On admission to the emergency room, her blood pressure (BP) was 90/60 mm Hg, pulse was 140 beats per minute (bpm), and temperature was 97.2° F. Approximately one-half hour later, her temperature had increased to 102.8° F., with her BP decreasing to 76 mm Hg systolic, requiring infusion of 5 percent dextrose in .45 percent saline (100 cc/h) to maintain her pressure at that level.

On examination, her BP was 76/48 mm Hg with a pulse of 96 bpm (supine), changing to 66/44 mm Hg and 104 bpm (erect); respirations were 22 per minute with a temperature of 102.8° F. The skin was warm and dry with decreased turgor and small petechiae on the feet and dependent portion of the calves. No other rash was noted. No lymphadenopathy was detected. The head was normal, sclera were clear, and the conjunctiva were pink and non-injected. Fundi showed flat discs without significant pathology. The ears, nose, and throat were normal except for a somewhat dried mucosa with white-coated tongue and a few petechiae on the roof of the mouth. The neck was supple, without jugular vein distension (JVD) or bruits. Lungs were clear. The point of maximal impulse (PMI) was not palpable, with a normal S1/S2, a faint S4, and a II/VI systolic murmur heard at the apex. The abdomen and rectal examinations were normal. The extremities were without edema, cyanosis, or clubbing. The patient was alert and oriented to time and place without any neurological deficit.

Urinalysis showed a specific gravity of 1.020, a pH of 5.0, protein was 2+, hemoglobin (Hb) was trace, with occasional white blood cells (WBC) and amorphous urate. The hematocrit (Hct) was 48.7 percent, manual platelet count was 25,000, and the white count was 9,900 (20 stabs, 67 segmented cells, 10 lymphocytes, and 3 monocytes). The mean corpuscular volume (MCV) was 93.7  $\mu\text{m}^3$ , the mean corpuscular hemoglobin (MCH) was 30.9 picograms per red cell, the prothrombin time (PT) was 12.7 seconds, and the partial thromboplastin time (PTT) was 33.0 seconds. The fibrinogen level was 150 mg/dl and the fibrin degradation products were 36  $\mu\text{g}/\text{ml}$ . Glucose was 187 mg/dl, the urea nitrogen was 35 mg/dl, sodium (Na) was 137 mEq/l, potassium (K) was 4.4 mEq/l, chlorine (Cl) was 96 mEq/l, and the carbon dioxide ( $\text{CO}_2$ ) was 23 mEq/l. The chest x-ray was normal. Arterial blood gases on room air showed a pH of 7.50,  $\text{pCO}_2$  of 22 mm Hg,  $\text{pO}_2$  of 88 mm Hg, and bicarbonate ( $\text{HCO}_3$ ) of 17

mEq/l. An electrocardiogram (EKG) showed sinus tachycardia with anteroseptal ST-T changes. These changes were consistent with myocardial infarction of undetermined age and possible current of injury.

The patient was admitted to the Coronary Care Unit for: (1) possible anteroseptal myocardial infarction (MI), (2) sepsis of unknown etiology -- possible RMSF, (3) dehydration and hypotension with orthostatic changes, and (4) thrombocytopenia. The patient received vigorous rehydration with 5 percent dextrose in .09 percent saline. Blood and urine were sent for culture and intravenous (IV) ampicillin, tetracycline, and gentamicin were started.

On the second hospital day, the patient's temperature had increased to 104.4° F. and her respirations were increased to 36 per minute. Her room air arterial blood gas (ABG) showed a pH of 7.35,  $\text{pCO}_2$  of 20 mm Hg,  $\text{pO}_2$  of 77 mm Hg, and a  $\text{HCO}_3$  of 11 mEq/l. Her white blood count (WBC) had increased to 16,800 with 42 stabs. Na, K, Cl, and calcium (Ca) were normal at that time. Her blood urea nitrogen (BUN) had increased to 36 mg/dl, aspartate aminotransferase (AST) to 358 U/l, alanine aminotransferase (ALT) to 112 U/l, and lactate dehydrogenase (LDH) to 522. A central line was placed for better IV access. Her hypotension was refractory to IV fluid therapy and dopamine was needed to support her BP above 90 mm Hg systolic. Ampicillin and gentamicin were discontinued and Primaxin and tetracycline were started with acetaminophen and a cooling blanket to reduce her temperature to 99.0° F. She developed increasing metabolic acidosis that required administration of Na  $\text{HCO}_3$  in her IV fluids. A Swan-Ganz catheter was placed with an opening pulmonary capillary wedge pressure (PCWP) of 7 to 9 mm Hg. A computed tomography (CT) scan of the abdomen revealed no evidence of significant abnormality. The patient exhibited a grand mal seizure lasting approximately one to two minutes. The patient was treated with IV Dilantin, and a CT of the head was obtained which revealed no definite abnormality. A second seizure occurred in the late afternoon and additional IV Dilantin was administered. A lumbar puncture was performed revealing clear yellow cerebrospinal fluid (CSF) with six WBCs (33 percent polymorphonuclear leukocytes, 47 percent lymphocytes, and 20 percent monocytes). The protein was 167 mg and the glucose was 137 mg/dl. Her platelet count had decreased to 22,000, and ten units of platelets were administered, raising the level to 54,000. By the end of the second hospital day, the patient had become increasingly lethargic and tachypneic, and continued to spike temperatures in excess of 104° F. Preliminary cultures were negative, so additional specimens were sent for cryptococcal antigens, RMSF titers, and Lyme titers. Antibiotic coverage was changed to chloramphenicol, ceftriaxone, and ampicillin after an infectious disease consult was obtained.

By the third hospital day, the patient remained lethargic and minimally responsive. Her BP had increased to 112/58 mm Hg and she was weaned from

dopamine. The patient's temperature had decreased to 98.7° F. with a maximum temperature of 100.4° F. Her WBC had increased to 22,900 and her Hct dropped to 34. Her Dilantin level was 11.8 and her pCO<sub>2</sub> had increased to 18. Serial creatine phosphokinase (CPK) and LDH isoenzymes returned negative for MI, and serial ECGs showed persistent anteroseptal ST elevations without evolutionary changes. On the following day, the patient's albumin had decreased to 1.8 with developing 2+ peripheral edema; her WBC had decreased 18,000 with her BP remaining stable, and a maximum temperature of 100.6° F. A repeat lumbar puncture was obtained showing 20 WBCs (78 percent polymorphonuclear leukocytes, 13 percent lymphocytes, and 9 percent monocytes), the protein was 117, and the glucose was 57 mg/dl. IV albumin was administered and tube feedings were begun. By the following day, the albumin had increased to 2.4, the WBC had decreased to 7,000, the platelets to 51,000, and the pCO<sub>2</sub> to 29 mEq/l. Her temperature remained in the normal range and she became more alert and oriented. By the sixth hospital day, she began taking oral nutrition and her peripheral edema had improved. IV fluids were discontinued, RMSF titers were positive at a level of 1:1,024, and only chloramphenicol was continued. She continued to improve and was transferred to the step-down unit on the eighth hospital day. She continued to remain afebrile with stable vital signs, and chloramphenicol was discontinued on the ninth hospital day.

Follow-up CT scan of the head showed right sphenoid sinusitis and an ear, nose and throat (ENT) consult was obtained. The patient was placed on oral tetracycline. The remaining serological and culture studies returned negative.

On the sixteenth hospital day, the patient's BP had dropped to 88/60 mm Hg with a temperature of 100.6° F. Her WBC was 5,700 and subsequent urine cultures returned with 100,000 colonies/cc of *Pseudomonas*. She was placed on appropriate antibiotic coverage and improved quickly. She continued to do well, ambulation was increased, and she was discharged home in good condition on the twenty-sixth hospital day.

### Discussion

Rocky Mountain spotted fever is a disease caused by tick-borne *Rickettsia rickettsii*. The mean incubation period is six to seven days but may range from one to ten days. The characteristic rash is macular in appearance, less than 4 millimeters in size, and usually appears between the third and fifth days of illness. Most patients present with a rash on the soles or palms. Only when treatment is delayed, as in our patient, does the rash become petechial.<sup>3</sup> The rash, however, can be absent in up to 16 percent of RMSF patients. The usual patient presentation of RMSF is felt to be fever, rash, and history of tick bite or exposure; however, only 3 percent of patients manifest this triad during the first three to four days of illness. Since most physicians

have not seen a case of RMSF, misdiagnosis is often the rule. When atypical signs and symptoms present, the delay in diagnosis and treatment can prove fatal. *Rickettsia rickettsii* appears to have a unique mechanism for causing cell injury. Infected cells undergo changes in the membrane framework of endoplasmic reticulum.<sup>1</sup> Resulting endothelial damage leads to widespread vasculitis. This can cause injury to multiple organ systems, with possible presentations ranging from acute appendicitis to myocardial infarction.<sup>4,5</sup> Studies of RMSF by Helmick et al showed abdominal pain as the initial presentation 30 percent of the time.<sup>6</sup> In a study of RMSF fatalities, death was due to a delay in diagnosis attributed to an absent or delayed appearance of rash, absent tick exposure, or atypical symptom presentation.<sup>7</sup> RMSF fatalities range from 3 percent to 8 percent in most studies.<sup>8</sup> Factors associated with the greatest mortality risk include: (1) male gender, (2) age greater than thirty years, (3) Black race, (4) central nervous system (CNS) involvement, (5) renal failure, (6) cardiac failure, (7) absence or late appearance of rash, (8) inappropriate antibiotic coverage, or (9) no tick exposure history.<sup>9</sup> In our patient, the development of confusion, lethargy, elevated liver functions, progressive uremia, hypotension, and initiation of antibiotic therapy one week after the onset of symptoms are considered poor prognostic signs. The fact that our patient survived is unusual since the RMSF fatality study done by Hattwick showed a 64 percent fatality rate when antibiotics were started six days after the onset of symptoms.<sup>8</sup> Many of the clinical features of this case study were typical for RMSF (i.e., fever, headache, thrombocytopenia), but the history of possible tick exposure provided the greatest support for empiric RMSF coverage.

There can be a vast number of differential diagnoses due to the multitude of potential atypical RMSF presentations. Chest pain with ECG changes has been described,<sup>5</sup> as has cholecystitis and appendicitis.<sup>6,10</sup> The more common differential diagnoses would include meningococemia, atypical pneumonia, measles, viral syndrome, mononucleosis, staphylococcal sepsis, toxic shock syndrome, overwhelming pneumococcal sepsis in an asplenic patient, syphilis, leptospirosis, typhoid fever, drug fevers, and rheumatic fever. In fact, RMSF should be in the differential diagnosis of any obscure febrile illness since early treatment of RMSF is necessary to ensure survival (Table).

Prompt treatment with administration of either tetracycline or chloramphenicol is the single most important therapeutic intervention. Other antimicrobial agents have no effect on the *Rickettsia rickettsii*. The study done by Hattwick et al<sup>8</sup> stated that death prior to four days of symptoms was exceedingly unusual, even without antibiotic therapy. This gives the physician some time to ponder a potentially difficult diagnostic dilemma. Tetracycline is given in a dose of 25-50 mg/kg/day, but not to children less than nine years old, for whom chloramphenicol is recommended. The chloramphenicol dose is 50 mg/kg/day. The patient's

## Table. Criteria for Clinical Diagnosis<sup>3</sup>

Laboratory criteria for clinical diagnosis as proposed by the CDC include:

1. Four-fold or greater rise in antibody titer to the spotted fever group antigen by immunofluorescent antibody (IFA), complement fixation (CF), latex agglutination (LA), microagglutination (MA), or indirect hemagglutination (IHA) tests.
2. Single titer  $\geq 1:64$  by IFA or  $\geq 1:16$  by CF
3. Positive immunofluorescence of skin lesion obtained by biopsy or organ tissue at autopsy.
4. Isolation of *Rickettsia rickettsii*.

Probable confirmation:

1. Four-fold rise in titer or a single titer  $\geq 1:320$  by Proteus OX-19 or OX-2.
2. Single titer  $\geq 1:128$  by LA, IHA, or MA.

temperature usually returns to normal on the third or fourth day of appropriate antibiotic therapy with a concomitant improvement in the patient's clinical picture. The RMSF disease process is a cascade;<sup>11</sup> as the disease progresses beyond four days of symptoms without therapy, death becomes more likely, punctuating the need for prompt, appropriate antibiotic therapy. This raises some delicate questions. Is it likely physicians will make the diagnosis on first presentation? If not, should tetracycline and chloramphenicol (both having potentially serious side effects) be administered with even the slightest possibility of RMSF? As in many other clinical circumstances, this

disease requires the best intuitive judgment of a well-informed physician.

## Which Box Would You Rather Deposit Your Insurance Reimbursements In?

If you process your claims through the mail, it takes an average of two months before your reimbursements make it to the bank.

And that can really put you in a box in terms of cash flow.

But not if you join the more than 1800 physicians who are now using HCS electronic claims systems. On the average, they receive payments in days, instead of months. Reason enough to consider using our custom designed systems.

What's more, our systems are labor savers. Stacks of claims that used to take weeks to process by mail can be sent through our claims

network in a matter of hours. Saving you enormously in administrative time. Not to mention postage.

And since HCS has the backing of a billion dollar health care organization, you can depend on us for long term support, service, and solutions as your office needs change.

Call Toll-Free 1-800-543-6711 for more information. Because in rain, snow, sleet or hail, we can deliver insurance reimbursements faster.

**Health Communication Services, Inc.**

*You'll Be Overwhelmed By Your  
Cash Flow, Not Your Overhead.*

# Continuing...

For over fifteen years, the Med Chi Agency has been serving the needs of Maryland physicians...*your* needs, with unrivaled commitment and dedication. And as the Agency has grown, so has your trust...in us, in our products and in the way we do business with you.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial options. Among these are:

Professional Liability Insurance (Malpractice)

Personal insurance, including homeowners, auto, boat and recreational vehicle coverage and personal umbrella insurance.

Office insurance, including medical equipment, medical records, computer equipment, account receivables, workers compensation, business auto and employee dishonesty

Financial and estate planning, specifically tailored to the medical professional.

Individual and group, life, health and income protection.

Qualified and non-qualified Retirement Planning

# Rhabdomyolysis and Acute Renal Failure: A Review of Two Cases

---

Marian Benner MD and Daniel Rossler MD

---

*Dr. Benner practices Emergency Medicine at Union Hospital of Cecil County in Elkton, MD and Dr. Rossler is a member of the house staff at Harbor Hospital Center, Baltimore, MD.*

---

*A possible complication of renal failure induced by rhabdomyolysis should be recognized in patients presenting with injuries involving muscle damage.*

---

**R**habdomyolysis is an acute, potentially fatal disease caused by destruction of skeletal muscle and evidenced by myoglobulinemia and myoglobinuria.<sup>1</sup> Muscle damage may be due to toxic, metabolic, infectious, or traumatic causes.<sup>2</sup> It is accepted that myoglobin in the circulation can lead to renal failure. Rhabdomyolysis and myoglobinuria are often due to extensive trauma. There are, however, non-traumatic causes of rhabdomyolysis, such as muscle ischemia induced by arterial insufficiency or drug overdose with resultant coma and muscle compression.<sup>1</sup> Muscles working under increased oxygen demands (exercise, seizures) or decreased energy production (hypokalemia, hypophosphatemia) can also result in muscle destruction. Tubular obstruction due to myoglobin precipitation and cast formation, along with nephrotoxic muscle breakdown products, may cause renal failure.

We present two cases of rhabdomyolysis-induced renal failure. In one case, muscle damage was due to a compression syndrome/crush injury. In the other, destruction was due to hyperthermia.

## Case Presentation

A.H. is a forty-five-year-old male who presented to the emergency room in a semicomatose state after being found lying on his left side for two days. On admission, he was hypotensive, oliguric, and had a left hemiplegia. He developed a compressive neuropathy of his left lower extremity, along with extensive muscle damage. During his hospital stay, he had persistent oliguria with hyperkalemia necessitating the institution of peritoneal dialysis. Laboratory tests revealed a blood urea nitrogen (BUN) of 21, a potassium level (K<sup>+</sup>) of 7.4, an hematocrit (Hct) of 55, a phosphate level (PO<sub>4</sub>) of 8.5, and a calcium level (Ca<sup>++</sup>) of 5.3. The extent of his renal failure was manifested by a rise in BUN to 117 and creatinine to 11.1. His creatinine phosphokinase (CPK) was 750,000, and urine and blood were positive for myoglobin. After three weeks of peritoneal dialysis, the patient slowly regained renal function. Two months after admission, he had a BUN of 22 and a creatinine of 1.5 (Figure 1).

## Case Presentation

H.R. is a thirty-two-year-old male who was brought to the emergency room unresponsive after an overdose of cocaine. He had a temperature of 105° F., severe muscle rigidity, and oliguria. Laboratory tests revealed a BUN of 38, a K<sup>+</sup> of 4.3, and an Hct of 43. The patient had had no urine output in twenty-four hours and

peritoneal dialysis was started. His CPK at that time was greater than 12,000, serum myoglobin was greater than 1,250, and urine myoglobin was 200. At the worst stage of his renal failure, he had a BUN of 90 and a creatinine of 15, with Ca<sup>++</sup> of 8.4 and PO<sub>4</sub> of 6.4. He required three weeks of peritoneal dialysis. Two months after treatment he had a BUN of 15 and a creatinine of 1.9 (Figure 2).

Figure 1. A.H.'s urine function over time

Figure 2. H.R.'s urine function over time

In reviewing these two cases, it is apparent that rhabdomyolysis is capable of producing severe renal toxicity. Renal failure progressed rapidly in both of these patients, necessitating peritoneal dialysis. The pathogenesis of renal failure caused by rhabdomyolysis is unclear. When serum myoglobin is high, particularly in cases where there is extensive muscle destruction, it becomes toxic to the kidney, primarily through tubular obstruction by myoglobin casts. Other factors contributing to the insult are toxin-induced vasoconstriction and increased permeability of the glomerular basement membrane. Hypovolemia and aciduria also enhance the development of renal injury. In addition to increased BUN and creatinine, Ca<sup>++</sup> and PO<sub>4</sub> levels rise in the serum.

In animal studies,<sup>3</sup> it has been shown that aciduria damages renal tissue by trapping myoglobin acutely within the tubules, and that bicarbonate (HCO<sub>3</sub>) protects the kidney by increasing urinary myoglobin solubility. The mechanism of cocaine injury in rhabdomyolysis has been postulated to be due to increased muscle activity and compression, hyperthermia, and vasospasm with muscle ischemia.

In conclusion, the possible complication of renal failure induced by rhabdomyolysis should be recognized in patients presenting with injuries involving muscle damage.

# Correlation of Holter Monitoring and Left Ventricular Function to Signal-averaged Electrocardiogram after Myocardial Infarction

Jorge Perez-Alard MD, Pankaj R. Desai MD,  
Ramanathe Sirithara MD, and Chris Papadopoulos MD

---

*From the Harbor Hospital Center, Baltimore, MD, where Dr. Perez-Alard is a Senior Resident, Department of Medicine; Dr. Desai is a member of the house staff; Dr. Sirithara is an Attending in the Division of Cardiology; and Dr. Papadopoulos is the Chief of Cardiology, as well as a Clinical Associate Professor in the School of Medicine, University of Maryland.*

---

*Holter monitoring, in combination with estimates of left ventricular function, helps to identify subgroups of patients in the immediate post-myocardial infarction period in whom late potentials may be present on signal-averaged ECG.*

---

About 1.5 million Americans will suffer a myocardial infarction (MI) this year, and approximately 6 to 10 percent of the survivors will experience sudden cardiac death within the first year. However, the risk of developing malignant ventricular arrhythmias will be even higher in certain subgroups.<sup>1,2</sup> Patients in the post-myocardial infarction period are at a high risk for re-entrant ventricular arrhythmias associated with sudden death.<sup>1,3</sup> Until recently, there have been no absolutely reliable means by which to noninvasively assess those patients at risk, and determine the appropriateness of further diagnostic evaluation and therapy. Signal-averaged electrocardiography has emerged as a very useful tool for identifying such patients at risk.<sup>4,5</sup> The signal-averaged electrocardiogram (SAECG) is capable of decreasing the level of noise contaminating the surface electrocardiogram, allowing for high frequency, low amplitude (HFLA) signals (i.e., late potentials (LP)) to be identified at the terminal portion of the QRS complex (Figure 1).<sup>4,5</sup>

Late potentials are delayed and inhomogeneous conduction through a scarred myocardium, thought to represent the arrhythmogenic substrate for re-entrant ventricular arrhythmias (Figure 2).<sup>1,2</sup> Several investigators have demonstrated a higher incidence of abnormal signal-averaged variables in those post-MI patients who experience sudden death or malignant arrhythmias.<sup>1,3,6-8</sup>

## Purpose

The purpose of this study was to correlate Holter monitoring and left ventricular function to late potential analysis on the SAECG of patients in the post-myocardial infarction period.

## Methods

Twenty-five patients with acute myocardial infarction were studied prospectively. The patients had been admitted to the Har-

bor Hospital Center coronary care unit between September 1989 and March 1990.

The diagnosis of acute MI was based on the occurrence of at least two of the following three criteria: (1) prolonged chest pain compatible with ischemia, (2) serial elevations of creatine phosphokinase (CPK)-MB isoenzyme levels, and (3) evolving ECG changes consistent with Q or non-Q infarction. Within a week of admission, SAECG, twenty-four-hour Holter-monitoring (HM), and left ventricular function, either by echocardiogram or radionuclide ventriculography, were obtained. Signal-averaging was performed at the bedside with the patient in the supine position according to standard methods using the Marquette, MAC 12/15, High Resolution Acquisition Module and Analysis software.<sup>1,8</sup> The Frank Lead Orthogonal system was utilized for lead placement, employing seven silver-silver chloride bipolar electrodes in the horizontal (X), vertical (Y), and sagittal (Z) planes. Leads are placed along the torso at the level of the fifth intercostal space, the back of the neck, and the left leg (Figure 3).<sup>1,4,5</sup> Approximately 250 repetitive QRS complexes were collected, preamplified, filtered, and amplified again. A vector magnitude (VM) was generated for each point of the averaged signal as  $V = \sqrt{X^2 + Y^2 + Z^2}$ . Data were then analyzed at high pass filtering of 25 and 40 hertz (Hz), and low pass filtering of 250 Hz, then recorded on floppy disk for further processing. Quantitative signal-averaged variables for the X, Y, and Z

vectors were calculated by the computer and visually inspected for abnormalities according to the criteria of Gomes et al (Table 1).<sup>7</sup> The three variables analyzed were: (1) the total filtered QRS complex duration in milliseconds (msec), (2) the root-mean-square voltage during the terminal 40 msec of the filtered QRS complex in microvolts, and (3) the duration of the HFLA signals under 40 microvolts, in milliseconds. A study was considered to be positive if one or more abnormal variables were present (Figure 4).

Results

Of the twenty-five patients studied, thirteen (52 percent) had an abnormal SAECG at 25 Hz and seven (28

ELVF	7/25 (28%)
(abnormal ejection fraction <40%)	
HM (Lown $\geq$ 2)	6/19 (32%)

Table 2C. Abnormal Variables Identified on the SAECG

Abnormal Variables	25 Hz	40 Hz
0	13	17
1	8	3
2	2	2
3	1	3
Rejected (Noise >1uV)	1	4

Table 3. Correlation of Late Potentials with Holter Monitoring and Estimates of Left Ventricular Function, Alone and in Combination

	Sensitivity	Specificity	+ Predictive Value	- Predictive Value	Diagnostic Accuracy
Holter Monitoring					
25 Hz	5/12 (42%)	5/6 (83%)	5/6 (83%)	5/12 (42%)	10/18 (56%)
40 Hz	3/6 (50%)	9/10 (90%)	3/4 (75%)	9/12 (75%)	12/16 (75%)
Estimates of Left Ventricular Function					
25 Hz	6/13 (46%)	10/11 (91%)	6/7 (86%)	10/17 (59%)	16/24 (67%)
40 Hz	2/6 (33%)	13/15 (87%)	2/4 (50%)	13/17 (76%)	15/21 (72%)
Holter Monitoring and Estimates of Left Ventricular Function					
25 Hz	11/24 (46%)	12/13 (92%)	11/12 (92%)	12/25 (48%)	23/37 (62%)
40 Hz	6/10 (60%)	22/28 (79%)	6/12 (50%)	22/26 (85%)	28/38 (74%)

Six Holter monitor results were not available for analysis, and five SAECGs were rejected due to a noise level above 1 microvolt. Most of the SAECGs identified as positive had only one abnormal variable present (Table 2C). Holter monitoring alone identified positive SAECGs with higher accuracy at 40 Hz high pass filtering, whereas estimates of left ventricular function alone had similar results at 25 Hz. Both tests, in combination, demonstrated the highest sensitivity, specificity, and positive and negative predictive value for being able to identify positive SAECGs. We note that the diagnostic accuracies did not achieve statistical significance (Table 3).

Gomes et al,<sup>6</sup> using the combination of Holter monitoring, ejection fraction, and SAECG, identified the subset of patients at highest risk for malignant arrhythmias or sudden cardiac death with a sensitivity of 100 percent and a specificity of 53 percent. Others have demonstrated SAECGs to have a lower sensitivity but a much higher specificity.<sup>5,9,10</sup> Our present study did not attempt to correlate late potentials to cardiac events, but to identify whether Holter monitoring or estimates of left ventricular function, alone or in combination, could predict late potentials on SAECG.

## Conclusion

We conclude that Holter monitoring, in combination with estimates of left ventricular function, helps to identify subgroups of patients in the immediate post-myocardial infarction period in whom late potentials may be present on SAECG. This combination of tests identified positive SAECGs with a sensitivity of 60 percent at 40 Hz, and a specificity and positive predictive value of 92 percent at 25 Hz. There was a negative predictive value of 85 percent and diagnostic accuracy of 74 percent at 40 Hz high pass filtering (Table 3).

We also conclude that both 25 and 40 Hz high pass filtering and 250 Hz low pass filtering are recommended when screening patients for late potentials with Holter monitoring or ejection fraction. We note that a larger study population is required for higher statistical correlation.

# Retrieval and Unknotting of Inadvertently Placed Intravascular Catheters

Diran R. Bezirdjian MD

*Dr. Bezirdjian is a Staff Radiologist at Harbor Hospital Center, Baltimore, MD.*

---

*Percutaneous transcatheter retrieval is a safe and reliable method which makes an operative procedure unnecessary and helps avert potentially fatal complications.*

---

The insertion of an indwelling venous catheter has become a commonplace procedure in the treatment of various clinical conditions. One of the most catastrophic iatrogenic complications of this procedure is the inadvertent loss of extracorporeal catheter control. This may happen during the initial insertion, such as with a fracture of the catheter tip, especially if it is of a soft silastic material, or during catheter exchange when the hub is severed in anticipation of replacement. This latter problem is especially frequent with inexperienced operators.

Such events may become medico-legal problems resulting in embarrassment to the involved clinical services. Complications include cardiac chamber perforation, pulmonary embolization, and sepsis.<sup>1</sup> These conditions are potentially fatal. Turner and Sommers reported a fatality from the accidental passage of a catheter into the right atrium.<sup>2</sup>

It is essential for the operator to recognize this complication at an early time. It also behooves the radiologist to be alert to the position of various support catheters, as serial chest radiographs are usually obtained in critically ill patients (Figures 1 and 2). The interventional radiologist should be the first one contacted for a percutaneous removal of such misplaced catheters. An elaborate surgical procedure, especially in the case of intracardiac catheters, may be averted.

The preferred approach in transcatheter retrieval is the femoral venous route, as this allows more flexibility in the positioning and maneuvering of the retrieving device. Since the description by Turner and Sommers,<sup>2</sup> a variety of retrieval techniques and devices have been reported, including the use of a snare, a basket, or an intravascular forceps.<sup>3,4</sup>

A catheter and wire combination is used to produce a loop around the foreign object which is then snared out. With the basket technique or using an intravascular forceps, the catheter to be retrieved is grabbed and caught in the wires of the basket or the toothlets of the forceps and removed (Figure 3).

When a catheter is inadvertently positioned in one of the cardiac chambers, the need may arise to first deflect the catheter tip away from the heart and into the inferior vena cava (IVC) prior to final

**Figure 1.** A chest radiograph shows separation of the tip of a Porta-Cath along the atriocaval junction.

**Figure 2.** A catheter and stiff wire combination is used to retrieve the broken fragment.

**Figure 3.** An indwelling catheter is caught within the wires of a basket during percutaneous retrieval.

**Figure 4.** A Swan-Ganz catheter is inadvertently knotted along the superior vena cava.

**Figure 5.** A stiff wire and catheter combination is used to untie the knot by pulling on the stiff wire at the groin while simultaneously applying gentle traction at the entry site of the knotted catheter. (Courtesy Dr. J. Tisnado, Medical College of Virginia, Richmond, VA.)

(Figures 4 and 5). Careful cardiac monitoring for arrhythmias is mandatory.

In conclusion, percutaneous transcatheter retrieval and unknotting of inadvertently placed intravascular catheters is a safe and reliable method that makes an operative procedure unnecessary and helps avert potentially fatal complications.

retrieval. The first step can be achieved using a deflector wire or a stiff wire hooked on a portion of the catheter to be retrieved.

A different problem may be encountered when a knot forms during insertion even though a venous catheter has been properly positioned. Knots can be untied by using a stiff or deflector wire engaged at the knot. Gentle traction on the wire at the groin, while simultaneously holding the knotted venous catheter at the entry site, usually unties the knot. This procedure is best performed with the knot positioned in the right atrium, to allow enough room for wire manipulation

## Component Society Presidents

The Medical and Chirurgical Faculty of Maryland and its component societies make up the Maryland family of medicine. This section of the *Maryland Medical Journal* is dedicated to the leaders of our component societies and features biographical information on Med Chi component society presidents.

### **Allegany County** **Kheder Ashker MD**

*Kheder Ashker MD* assumed the office as President of the Allegany County Medical Society in January 1991. A 1972 graduate of Damascus Medical School, Dr. Ashker fulfilled his internship and Surgical residency requirements at the Shadyside Hospital in Pittsburgh, Pennsylvania. In 1975, he began a two-year residency specializing in Anesthesiology at West Virginia University where he also completed Neurosurgical residency training. Dr. Ashker has maintained a Neurosurgical practice in Cumberland, MD since 1981.

### **Anne Arundel County** **Ronald C. Sroka MD**

*Ronald C. Sroka MD* began his second term as President of the Anne Arundel County Medical Society in January 1991. Born in Baltimore, Dr. Sroka attended the University of Maryland where he received both his BA and MD degrees. He served his internship and residency in Family Medicine at Franklin Square Hospital where he became Chief Resident in 1978. Dr. Sroka currently maintains a Family Practice in Crofton, MD and is a member of the medical staff at Anne Arundel Medical Center.

Dr. Sroka currently maintains a Family Practice in Crofton, MD and is a member of the medical staff at Anne Arundel Medical Center.

### **Baltimore City** **Joseph H. Hooper MD**

*Joseph H. Hooper MD* became President of the Baltimore City Medical Society at the Society's Annual Meeting on December 7, 1990. Dr. Hooper is a native Baltimorean who received his medical degree from The Johns Hopkins University Medical School in 1954. He served his internship and residency at Union Memorial Hospital

from 1954 to 1956, and then entered the U.S. Navy. He finished active duty as Lieutenant Commander in 1958 and resumed his residency training at the Veteran's Administration Hospital in Perry Point, MD. He returned to Union Memorial Hospital, completing his residency training as Chief Surgical Resident in 1963 and entered the private practice of Surgery in Baltimore City. He is a fellow of the American College of Surgeons and holds hospital privileges at Union Memorial Hospital, Greater Baltimore Medical Center, and The Johns Hopkins Hospital.

### **Baltimore County** **Harold B. Bob MD**

*Harold B. Bob MD* was installed as the ninety-second President of the Baltimore County Medical Association at its Annual Meeting on January 12, 1991. Born in Buffalo, New York, Dr. Bob received his BS and MD degrees from the State University of New York at Buffalo. He fulfilled his internship and residency requirements at Wilmington Medical Center in Delaware. A member of the medical staff of Baltimore County General Hospital, he is a Family Practice physician who has maintained an office in the Pikesville area since 1976.

A member of the medical staff of Baltimore County General Hospital, he is a Family Practice physician who has maintained an office in the Pikesville area since 1976.

**Calvert County**  
Joseph S. Fastow MD, MPH

*Joseph S. Fastow MD, MPH* began his term as President of the Calvert County Medical Society in January 1991. A 1962 graduate of Rutgers University, Dr. Fastow received his MD from the Boston University School of Medicine. He fulfilled his internship requirements at the Pennsylvania Hospital in Philadelphia and later went on to become Assistant Resident in Anesthesiology (Intensive Care Medicine) at the George Washington University Hospital in Washington, DC. During that period, Dr. Fastow also served in the military and worked for the U.S. Public Health Service, the Food and Drug Administration, and the National Heart and Lung Institute. From 1974 to 1977, Dr. Fastow completed a residency and fellowship in Emergency Medicine at The Johns Hopkins Hospital. In 1977, he earned an MPH from The Johns Hopkins University School of Hygiene and Public Health. He took a position as a Clinical Instructor for the Georgetown University School of Medicine where he later advanced to Clinical Assistant Professor in 1981. A fellow of the American College of Emergency Physicians, Dr. Fastow has held a number of positions including, Assistant Director to the Department of Emergency Medicine at the Doctors' Hospital of Prince George's County and staff physician at the Department of Emergency Medicine at Holy Cross Hospital. He has been Director of Emergency Services for Calvert Memorial Hospital in Prince Frederick, Maryland since 1985.

**Caroline County**  
Christian E. Jensen MD

*Christian E. Jensen MD* began his twelfth consecutive year as President of the Caroline County Medical Society in January 1991.

Dr. Jensen obtained a BA and an MA in Economics from Rutgers University and worked as a business executive for five years before enrolling at the Duke University Medical School from which he graduated in 1972. An officer in the U.S. Naval Reserve since 1955, he served his internship at the Naval Hospital in Portsmouth, Virginia and then immediately entered into a private Family Medicine practice in Denton, MD. In 1982, Dr. Jensen accepted a position as medical supervisor for E.I. Dupont De Nemours in Seaford, Delaware. During his eight-year

tenure with that company, Dr. Jensen completed a mini-residency in Occupational Medicine at the University of Cincinnati College of Medicine and graduated from the Naval War College in Newport, Rhode Island. In 1990, he received an MPH from the Medical College of Wisconsin and became President and Corporate Medical Director of the Delmarva Foundation in Easton, Maryland. In January of this year, Dr. Jensen was recalled to active military duty with the U.S. Navy for Operation Desert Storm in Saudi Arabia.

**Carroll County**  
Chitrachedu Naganna MD

*Chitrachedu Naganna MD* began his second term as President of the Carroll County Medical Society in January 1991. Dr. Naganna attended the Government Arts College in India and received his medical education at SV University in India from 1962 to 1967. After receiving his medical degree, he served a house surgeonship at the KMC

Government Hospital in India. He served his internship, residency, and senior residency at the Jamaica Hospital in Queens, New York. In 1972, Dr. Naganna accepted a fellowship in Cardiology at the Brookdale Hospital Medical Center in Brooklyn. From 1974 to 1975, Dr. Naganna was an assistant attending on the associate medical staff in Medicine and Cardiology of Brookdale Hospital Medical Center. He was a consultant in Cardiology at the Flatbush General Hospital in Brooklyn and a consultant in Medicine and Cardiology at the Brooklyn State Hospital in 1974. The following year, Dr. Naganna moved to Maryland where he now holds hospital privileges at Carroll County Hospital and Baltimore County General Hospital.

**Cecil County**  
Henry Farkas MD, MPH, FACEP

*Henry Farkas MD, MPH, FACEP* began his sixth year as President of Cecil County Medical Society in January 1991. Dr. Farkas was born in New York City, attended Loyola College, and earned his medical degree from The Johns Hopkins Medical School in 1970. In 1971, he received his MPH from The Johns Hopkins School of Hygiene and Public Health. After fulfilling his internship at the Lancaster General Hospital in Lancaster, Pennsylvania, Dr. Farkas served as General Medical Officer for the U.S. Public Health Service on a Navajo Reservation in Chinle, Arizona.

In 1973, he returned to Maryland where he served as an emergency physician for Harford Memorial Hospital. From 1984 to 1990, Dr. Farkas worked as Medical Director for the Cecil County Detention Center. Dr. Farkas now practices Emergency Medicine at Union Hospital of Cecil County. He also holds positions as Medical Director for the Northern Chesapeake Hospice and the Medical Adult Day Care Center of Union

Hospital of Cecil County.

**Dorchester County**  
W. Craig Wessells MD

*W. Craig Wessells MD* became President of the Dorchester County Medical Society in January 1991. Born in Nassawadox, Virginia, he earned a BS from the College of William and Mary in 1975, and graduated from the Eastern Virginia Medical School in 1978. After serving his internship and first-year residency at the Eastern Virginia Medical School, Dr.

Wessells completed his residency training at the Sheppard and Enoch Pratt Hospital in Baltimore in 1983. That same year, he began a fellowship in Child and Adolescent Psychiatry at the University of Maryland and Sheppard and Enoch Pratt Hospitals, becoming Chief Fellow in 1984. Dr. Wessells is currently staff psychiatrist at the Eastern Shore Hospital Center and maintains a private practice in Cambridge.

**Frederick County**  
Henry P. Laughlin MD, ScD, ScSD

*Henry P. Laughlin MD, ScD, ScSD* became President of the Frederick County Medical Society in January 1991 and is the first physician to have held the office of President in both Frederick and Montgomery Counties (1959-1960). A native of Hagerstown, Dr. Laughlin attended The Johns Hopkins University and earned a BS from Ursinus College in 1938. He obtained his medical degree from the Temple University

School of Medicine in 1941. Following graduation, he served over seven years as a U.S. Navy physician and surgeon during World War II in the American, Caribbean, African-European, and Asiatic theaters of operation, as well as in the United States. Following the war, Dr. Laughlin maintained a private practice as a specialist in Psychiatry

for forty years in the Chevy Chase, Bethesda, and Frederick areas. During that time, he served fellowships for the American Medical Association and the Washington Medical and Surgical Society. He was a faculty member at the George Washington University Medical School for thirty-five years, the last six with the rank of Clinical Professor. From 1974 to 1989, Dr. Laughlin served as Distinguished Visiting Professor at the University of Louisville School of Medicine. An active participant in numerous organizations, Dr. Laughlin is the recipient of many awards and holds an honorary ScD degree from Ursinus College and an ScSD degree from the University of Louisville. Dr. Laughlin currently serves as Associate Editor for the *Maryland Medical Journal* and the *Physician's Practice Digest*. He is also an emeritus staff member of Suburban Hospital in Bethesda and Frederick Memorial Hospital.

**Garrett County**  
John L. Porcaro MD

*John L. Porcaro MD* began his second term as President of the Garrett County Medical Society in January 1991. Born in New York City, Dr. Porcaro graduated from the University of Medicine and Dentistry of New Jersey (UMDNJ) in Newark where he began his residency in General Surgery in 1978. He moved on to become a resident in

Ear, Nose, Throat, Head and Neck Surgery at the Columbia University College of Physicians and Surgeons in New York. Dr. Porcaro returned to UMDNJ to complete his residency training in General Surgery and became a fellow in Vascular Surgery in 1982. A

fellow of the American College of Surgeons, Dr. Porcaro was appointed Clinical Assistant Professor of Surgery for the West Virginia University. He is currently Chief of Staff and Chief of the Anesthesia Department for the Garrett County Memorial Hospital.

**Harford County**  
Joseph A. Reinhardt MD

*Joseph A. Reinhardt MD* became President of the Harford County Medical Society in January 1991. After he obtained a BS from the University of Maryland, Dr. Reinhardt attended The Johns Hopkins University Medical School and graduated in 1973. He served his internship and residency at the Georgetown University Hospital from 1973 to 1976,

after which he completed a Cardiology fellowship at the Medical College of Virginia. Dr. Reinhardt currently serves as Assistant in Medicine at The Johns Hopkins Medical School. He is an active staff member of the Fallston General Hospital and is a courtesy staff member at Harford Memorial Hospital, Greater Baltimore Medical Center, and The Johns Hopkins Hospital.

**Howard County**  
Charles E. Taylor MD

*Charles E. Taylor MD* was inaugurated as President of the Howard County Medical Society in January 1991. Originally from Pennsylvania, Dr. Taylor graduated from Swarthmore College in Pennsylvania and received his medical degree from the Washington University School of Medicine in St. Louis, Missouri in 1953. He served his

internship and residency at the St. Louis City Hospital. In 1957, he completed his resident training at the Maine Medical Center in Portland, following which he maintained a private practice in Internal Medicine in New Hampshire for thirteen years. He moved to Columbia, Maryland in 1969 and entered into group

practice with the Columbia Medical Plan and Patuxent Medical Group, where he continues to practice Internal Medicine. An active staff member of the Howard County General Hospital, Dr. Taylor is also on the courtesy staff of The Johns Hopkins Hospital.

**Kent County**  
Douglas M. Cummings MD, FACS

*Douglas M. Cummings MD, FACS* was installed as President of the Kent County Medical Society in January 1991. After graduating from the U.S. Military Academy at West Point, New York, Dr. Cummings was in the U.S. Army for four years and served in Vietnam before entering medical school. He graduated from the University of Arkansas

School of Medicine in Little Rock in 1976. He completed his internship and residency in Urology at the Walter Reed Army Medical Center in Washington, DC. He retired from the military in 1988 after practicing at the Fort Meade Army Hospital and established a private practice in Chestertown. A fellow of the American College of Surgeons, Dr. Cummings currently resides in Betterton, Maryland.

**Montgomery County**  
Herman C. Maganzini MD

*Herman C. Maganzini MD* FACP was inducted as President of the Montgomery County Medical Society (MCMS) on May 1, 1991 and is the first physician to be elected as MCMS President on two different occasions: 1972-1973 and 1991-1992. A native of New York City, Dr. Maganzini graduated from Fordham University and received

his medical degree from Georgetown University School of Medicine in 1952. He served his internship in Internal Medicine at the Georgetown University Hospital and at the U.S. Air Force Hospital on the Mitchell Air Force Base in New York. He returned to

the Washington, DC area in 1955 to fulfill his residency training in Internal Medicine at the Georgetown University Hospital and the Veterans Administration Hospital in Washington, DC. From 1959 to 1962, Dr. Maganzini served as a Research Associate in the Department of Physiology and Biophysics at the University of Georgetown School of Medicine. A fellow of the American College of Physicians, Dr. Maganzini currently maintains a private Cardiology practice in Rockville. He is senior attending physician at Suburban Hospital, an attending physician at Holy Cross Hospital, and a member of the courtesy staff at Shady Grove Adventist Hospital.

**Prince George's County**  
Suresh C. Gupta MD, FCCP

*Suresh C. Gupta MD, FCCP* was inaugurated as President of the Prince George's County Medical Society in January 1991. Dr. Gupta earned his MBBS degree from the All India Institute of Medical Sciences in New Delhi, India, where he also completed his internship and served as resident house physician in Internal Medicine. Dr.

Gupta also served residencies at the Chase Farm Hospital in Middlesex, England; the War Memorial Hospital in Lincolnshire, England; the Worcester City Hospital in Worcester, Massachusetts; and the DC General Hospital in Washington, DC. Dr. Gupta served fellowships in Chest Diseases for the Georgetown Medical Division of the DC General Hospital in 1969 and 1971, and the Georgetown University Hospital in 1970. From 1972 to 1973, Dr. Gupta was an Assistant Professor of Medicine for the Pulmonary Disease Division of Howard University. He was also a lecturer in Physiology and Biophysics at the Georgetown University School of Medicine and a Clinical Instructor at the Georgetown University School of Medicine. Dr. Gupta is currently Medical Director for the Cora B. Wood Senior Center in Brentwood, MD. Dr. Gupta is Board Certified in Internal Medicine and Pulmonary Medicine and also has a private practice in Prince George's County. He was recently appointed by Parris Glendening as Vice Chairperson of the Prince George's County Executive's Blue Ribbon Commission on Health. He also serves as an Executive Committee member of Prince George's County Medical Center.

**Washington County**

J. Ramsay Farah MD, MPH, FAAP, FACPM

*J. Ramsay Farah MD, MPH, FAAP, FACPM* has served as the President of the Washington County Medical Society since 1989. Born in Beirut, Lebanon, Dr. Farah received his BSC, MD, and PL I at the American University of Beirut. He completed his PL II and PL III residency requirements at the University of Maryland Hospital where

he also served a fellowship in Pediatrics. At The Johns Hopkins University School of Hygiene and Public Health, he completed his MPH and residency training in General Preventive Medicine (epidemiology). Dr. Farah is a fellow of both the American Academy of Pediatrics and the College of Preventive Medicine. He has served on the faculties of the University of Maryland and The Johns Hopkins University. He has been very active in the western Maryland region, serving as Chairman of Ambulatory Care at the Cumberland Memorial Hospital and as Chairman of Pediatrics at Washington County Hospital. His work has included significant care for retarded and handicapped citizens. He has served extensively as a member and officer of diverse health associations, hospital committees, and executive boards at the local, national, and international levels. Through the years he has distinguished himself with continuous and relentless efforts in professional and community service. He is a recipient of Med Chi's A.H. Robins Award. Dr. Farah currently maintains a private practice in Hagerstown.

**Wicomico County**  
Farouk A. Sultani MD

*Farouk A. Sultani MD* began his term as President of the Wicomico County Medical Society in January 1991. Born in Kampala, Uganda, Dr. Sultani attended the Government College in Hyderabad and received an MBBS from the Sin University Liaquat Medical College in Pakistan in 1972.

Four years later, he graduated from the University of Miami School of Medicine with an ECFMG-MD degree. Dr. Sultani fulfilled his Surgical internship at the St. Francis Hospital in Miami Beach. In 1980, after completing his residency training in General Surgery at Maryland General Hospital and the University of Maryland Medical System, he moved to Jackson, Mississippi to undertake two years of residency training in Plastic, Reconstructive, and Hand Surgery. Dr. Sultani currently maintains a private Plastic, Reconstructive, and Hand Surgery practice in Salisbury. He maintains hospital privileges at Peninsula General Hospital and Memorial Hospital, and is a consultant to Deer's Head Rehabilitation Center.

**Worcester County**  
**Stephen F. Waters MD**

*Stephen F. Waters MD* began his second term as President of the Worcester County Medical Society in January 1991. Born in Gettysburg, Pennsylvania, Dr. Waters received his BA in Biology at the Catholic University of America in Washington, DC. He studied at the Catholic University of America and the University of Maryland before entering the Georgetown University School of Medicine in 1976. After receiving his MD in 1980, Dr. Waters served a Family Practice residency at Franklin Square Hospital until 1983. Dr. Waters currently maintains a private practice in Fami-

ly Medicine and Ambulatory Medicine at the Ocean City Medical Center.

**Student Component Society**  
**W. David Sullivan**

*W. David Sullivan*, a third-year medical student at The Johns Hopkins University, is currently serving as President of the Medical Student Component Society of the Medical and Chirurgical Faculty of Maryland. Born in Mississippi, Mr. Sullivan graduated from the University of Southern Mississippi in 1987. He spent his first postgraduate

year studying at the Federal Institute of Technology in Zurich, Switzerland, as a Fulbright Scholar. Mr. Sullivan currently serves as an alternate delegate for Med Chi's Delegation to the American Medical Association (AMA) and attended the AMA's 1990 annual and interim meetings.

**M**ed Chi would also like to recognize those Component Presidents whose biographical information was not available at press time:

**Charles County**  
**Seetaramayya Nagula MD**

**Queen Anne's County**  
**John R. Smith, Jr. MD**

## A Clinical Moment With . . . Diabetes

### The Management of Early Morning Hyperglycemia: Is it Due to Somogyi Effect or Dawn Phenomenon?

*Doctor: My blood glucose test is almost always 200 mg/dl or more when tested at 7:00 a.m. I can keep it at approximately 130 mg/dl before meals and at bedtime. If I reduce the bedtime snack, I will occasionally have a 3:00 a.m. reaction. If I increase the evening insulin dose, I am apt to have a reaction before bedtime. What can I do to correct this problem?*

In the past, hyperglycemia occurring between 5:00 a.m. and 9:00 a.m. was thought to occur only in patients with insulin-dependent diabetes mellitus (IDDM), but it is now known to occur in patients with noninsulin-dependent diabetes mellitus (NIDDM) as well and, to a mild degree, in people who do not have diabetes mellitus.

The Somogyi effect (rebound hyperglycemia following a hypoglycemic episode due to counterregulatory hormone excess) was once thought to explain most of the early morning hyperglycemic results. When it was observed that hyperglycemia could occur even though euglycemia would be maintained during the night, the term "dawn phenomenon" was invoked. It is thought to result from nocturnal increases in growth hormone. Another tenable hypothesis appears to be a variant of a circadian rhythm. The dawn phenomenon is treated by delivering insulin to cover the anticipated nocturnal rise in growth hormone. This can be done with conventional insulin injections or by carefully adjusting the meal plan and the evening dose of modified insulin. In some patients, moving the evening dose of modified insulin from before the evening meal to before bedtime will solve the problem. However, caution must be

exercised because of day-to-day variability of this phenomenon.

The Somogyi effect is treated by adjusting the meal plan, the insulin dose, and the exercise program to prevent nocturnal hypoglycemia. If such a rebound is encountered, blood glucose values may be high temporarily. In this situation, one should not "chase" the elevated blood glucose with more insulin, but allow the upset condition a day or two to become quiet. One must keep in mind the possibility of hypoglycemic episodes during sleep which go unnoticed by the patient.

Occasional self-monitoring of blood glucose between 3:00 a.m. and 4:00 a.m. will provide objective data as to whether one is dealing with a Somogyi effect or the dawn phenomenon.

DeWITTE DeLAWTER MD  
Editor

### The New Patient Self-Determination Act: How This Law Will Affect the Maryland Physician

The Federal government has recently passed new legislation entitled the *Patient Self-Determination Act* (the Act), which will become effective on or about January 1, 1992.<sup>1</sup> This will be the first time the Federal government will require providers of health care to maintain written policies and procedures governing the adult patient's right to make health care decisions, including the right to accept or refuse medical or surgical treatment and the right to make advance directives.<sup>2</sup> The law will apply to hospitals, home health agencies, hospices, and HMOs receiving Medicare and/or Medicaid funds.

As a result of this new law, organizations offering health care will be required to have written institutional policies relating to the implementation of a patient's advance directives. In this regard, the Act expressly directs providers to document in an adult patient's medical record whether or not the patient has executed an advance directive. The law also explicitly prohibits discrimination against an individual based on whether or not he or she has executed an advance directive.

The Act contains two other salient points. First, organizations providing health care will be required to educate their staffs and the community concerning living wills and medical durable powers of attorney. Second, they will be responsible for assuring that their institution or organization complies with their state's legal requirements governing advance directives.

Although this law will have a profound impact on hospitals and other organizations providing health care, it will have less effect on the role and responsibilities of Maryland physicians. The physician's role concerning patient advance directives has previously been delineated by the Maryland living will statutes in connection with the withholding or withdrawal of life-sustaining procedures.<sup>3</sup> The Maryland Attorney General has written several opinions in an effort to clarify the law and the physician's responsibility with respect to advance directives.

Under the present Maryland law, any legally competent individual over eighteen years of age, can execute a document in advance which declares his or her choices concerning medical treatment decisions when or if s(he) becomes terminally ill or is unable to make his or her own medical treatment decisions.<sup>3</sup>

These laws have interpreted the physician's main responsibility as "providing [the patient] with sufficient information to permit the patient himself to make an informed and intelligent decision..."<sup>4</sup>

According to the law, physicians are required to implement the patient's advance directives and to certify when patients become unable to make their own health care decisions.<sup>5</sup> Although an attending physician may refuse to comply with a patient's advance directive because of his or her own values or

ethics, the physician is obligated to make every reasonable effort to transfer the patient to another physician who will comply with the patient's decision.<sup>6</sup>

The attending physician should place the written advance directive in the patient's medical record for the purpose of documentation as part of his or her medical conclusions.<sup>7</sup> The attending physician may not implement an advance directive if s(he) knows that the declaration has been revoked or that there is a reasonable basis to believe that the patient has revoked the declaration.<sup>7</sup>

A significant feature of Maryland law is that a living will or medical power of attorney may not be implemented if it will deny a patient medical procedures and medication necessary to provide comfort or care, or to alleviate pain. Furthermore, an advance directive may not be implemented if the patient is pregnant.<sup>8</sup>

In response to numerous questions from the health care community regarding advance directives, the Attorney General of Maryland issued several opinions interpreting the living will laws and recognizing the legal effect of a medical power of attorney. In one such opinion, the Attorney General stated that if a person has a properly executed living will, s(he) has the statutory right to have his or her decisions about life-sustaining procedures carried out.<sup>9</sup> The Attorney General also suggested that the current power of attorney law, which authorizes the creation of a general durable power of attorney, is legally sufficient to allow individual patients to write a durable medical power of attorney.<sup>10</sup>

In his 1990 opinion, the Maryland Attorney General directly addressed the dilemma of the physician faced with a patient who has not written an advance directive but who requires a life-sustaining medical decision.<sup>4</sup> The Attorney General advises that if a patient is disabled and has neither decided about the use of life sustaining measures in writing nor has designated an agent to do so, a decision to forgo treatment may be made by either a guardian with the court's approval or by the patient's family if the patient is terminally ill.<sup>4</sup>

The Attorney General also confirmed that the physician's role is to identify the medically reasonable alternatives and the consequences thereof, and to offer a recommendation to the patient. However, the final decision-making authority does not reside with the physician. If the physician believes that a countervailing interest, such as the protection of dependents, should cause the patient's choice to be overridden, the physician should take steps to bring the matter to court.<sup>4</sup>

In conclusion, the new Federal *Patient Self-Determination Act* will significantly change the responsibilities of hospitals and other organizations providing health care but will have little impact on the Maryland physician's role and responsibilities regarding patients' advance directives. This new law will be of mutual benefit to both patients and physicians because it enhances

8. Md. Health-Gen. Code Ann. §5-605.
9. 73 Op. Att'y Gen. 253 (1988).
10. Md. Est. & Trusts Code Ann. §13-601 and 73 Op. Att'y Gen. 272, 275 (1988). The Attorney General suggests that §13-601 of the Estates & Trusts Article, which authorizes the creation of a "durable power of attorney," is legally sufficient to use for writing a medical power of attorney. In arriving at this conclusion, the Attorney General noted that the language of Health-Gen. Code Ann. §§20-107(d) also refers to a durable power of attorney that relates to medical care and is executed under §13-601 of the Estates & Trust Article. The Attorney General used the statutory references as evidence that the Maryland Legislature reorganized a medical power of attorney as a legally-effective instrument in Maryland.

## Board of Physician Quality Assurance Actions

**In the Matter of  
Manjit R. Bajwa MD  
Before the  
Maryland Board of  
Physician Quality Assurance  
Surrender of License**

December 10, 1990

Dear Dr. Weiner and Members of the Board:

Please be advised that I have decided to surrender my license to practice medicine in the State of Maryland, License Number D12841. I understand that I may not give medical advice or treatment to any individual, for compensation or otherwise, and cannot prescribe medications. In other words, I understand that surrender of my license means that I am in the same position as an unlicensed individual. This decision to surrender my license to practice medicine in the State of Maryland is public, and REVOCABLE, subject to the conditions described as follows:

1. This Letter of Surrender shall become a public document and shall become effective immediately upon its acceptance by the Board of Physician Quality Assurance (the Board), that date being the date on which the Board approves this Letter of Surrender;
2. This period of surrender of my license to practice medicine in the State of Maryland shall stay in effect pending the resolution of all charges involving the suspension of my license to practice medicine in the Commonwealth of Virginia, pursuant to the Order of Summary Suspension, dated on or about October 19, 1990, issued by the Board of Medicine of the Commonwealth of Virginia;
3. After the resolution of all charges involving the suspension of my license to practice medicine in the Commonwealth of Virginia, as described above, I may petition the Board for reinstatement of my license to practice medicine in the State of Maryland. I understand that the Board may take into account the actions of the Commonwealth of Virginia in making a determination of whether to reinstate my license to practice medicine in the State of Maryland;
4. Any resolution of the matters involving this REVOCABLE Letter of Surrender by the Board shall not in any way affect the pendency and any prosecution of any charges brought against my license to practice medicine contemplated by the Board pursuant to the Maryland Medical Practice Act, *Maryland Health Occupations Code Annotated*, §14-501, *et seq.*

My decision to engage in this agreement with the Board to surrender my license to practice medicine in the State of Maryland has been prompted by the

notification of the Board by the Board of Medicine of the Commonwealth of Virginia of those matters involving the aforementioned suspension of my license to practice medicine in the Commonwealth of Virginia, in which it was alleged that I violated certain laws relating to the practice of medicine in the Commonwealth of Virginia, and that my continued practice of medicine constituted a substantial danger to the public health and safety.

On Thursday, December 6, 1990, I received notice of the Board's vote of November 28, 1990 to summarily suspend my license pursuant to *State Government Code Annotated* §10-405 and to charge me under *Health Occupations Code Annotated* §14-504(a)(1) and (21), with underlying grounds (4) and (22).

Section 14-504(a) provides, in pertinent part:

- (a) In general, subject to the hearing provisions of §24-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:
  - (1) Fraudulently or deceptively obtains or attempts to obtain a license for the applicant or licensee, or for another; and
  - (21) Is disciplined by a licensing or disciplinary authority . . . of any state . . . for an act that would be grounds for disciplinary action under this section.

The underlying grounds that the Board found would be actionable under §14-504(a)(21) include the following:

- (4) Is professionally . . . incompetent; and
- (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

My decision to engage in a voluntary agreement with the Board to surrender my license to practice medicine in the State of Maryland is based on my desire to avoid summary suspension under *State Government Code Annotated* §10-405. The basis for the summary suspension would include the findings contained in the Order for Summary Suspension issued by the Board of Medicine of the Commonwealth of Virginia, as described above.

I affirm that I have current active hospital privileges at Holy Cross Hospital, located in Silver Spring, Maryland, and Leland Memorial Hospital, located in Riverdale, Maryland, and that I do not have any other privileges at any other hospital, health maintenance organization (HMO), or any other health care institution in the State of Maryland. I also affirm that I am currently licensed to practice medicine in the District of Columbia, and that my license to practice medicine in the Commonwealth of Virginia has been suspended, as described above.

As part of this Letter of Surrender, I shall advise any hospital, HMO, or any other health care facility in the State of Maryland in which I have privileges or am affiliated, that I shall agree to suspend my privileges at

that institution subject to the resolution and conclusion of all matters involving the suspension of my license to practice medicine in the Commonwealth of Virginia, as described above.

I understand that the Board will advise the Federation of State Medical Boards and the National Practitioner's Data Bank, as required by Senate Bill 99-660, through this Letter of Surrender, and any response to inquiry, that I have engaged in an agreement to enter into a REVOCABLE surrender of my license pending the resolution of the Order for Summary Suspension issued by the Board of Medicine of the Commonwealth of Virginia, as described above.

I affirm that I have a current Maryland Controlled Dangerous Substances Registration Certificate M30503, expiration-dated June 30, 1991, issued by the Maryland Division of Drug Control. I acknowledge that I do not have a United States Drug Enforcement Administration Certificate for the State of Maryland.

I acknowledge that, on the date that the Board accepts this REVOCABLE Letter of Surrender, I must present to the Board, Maryland License D12841, including any renewal certificates and wallet-signed renewal cards, and Maryland Controlled Dangerous Substances Registration Certificate M30503, including any prescription pads bearing my name and any prescription ordering forms in my possession or under my control. I further acknowledge that, on the date that the Board accepts this Letter of Surrender, the Board will send a copy of this Letter of Surrender to both the State of Maryland Division of Drug Control and the United States Drug Enforcement Administration, attesting that I am surrendering my privilege to prescribe controlled dangerous substances in the State of Maryland.

I further acknowledge that, on the date that the Board accepts this REVOCABLE Letter of Surrender, the Board will send a copy of this document to John P. Hopkins, Executive Director of the District of Columbia Board of Medicine, 605 G Street, NW, Room 202, Lower Level, Washington, DC 20001, and Hilary H. Connor MD, Executive Director, Board of Medicine of the Commonwealth of Virginia, 1601 Rolling Hills Drive, Suite 200, Richmond, VA 23229.

Finally, I wish to make clear that I have consulted with an attorney before signing this REVOCABLE Letter of Surrender of my license to practice medicine in the State of Maryland. I understand the nature of the Board's actions and this Letter of Surrender fully. I make this decision knowingly and voluntarily. My action, by virtue of this Letter, is not intended to be, nor should it be construed as, an admission of any guilt on my part to any allegations of wrongdoing made by the Virginia Board of Medicine or made or contemplated by the Maryland Board of Physician Quality Assurance.

MANJIT R. BAJWA MD

On behalf of the Board of Physician Quality As-

surance, on this 12th day of December 1990, I accept Manjit R. Bajwa MD's surrender of her license to practice medicine in Maryland.

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

**In the Matter of  
Rakesh Chandra MD  
Before the  
Maryland Board of  
Physician Quality Assurance**

**Final Decision**

**T**he Board of Physician Quality Assurance (the Board) issued charges against Rakesh Chandra MD (Respondent) on August 2, 1989. The Board charges Respondent pursuant to *Md. Health Occ. Code Ann. (HO) §14-504(6)*.<sup>1</sup> Specifically, the Board charges that

Subject to the hearing provisions of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee is convicted of or pleads guilty ... with respect to a crime of moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside (HO §14-504(6)).

A pre-hearing conference was scheduled for September 18, 1989. The Respondent did not attend the pre-hearing conference because he was in India at the time. The hearing was conducted on September 26, 1989. Present at the hearing were: Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor for the Board; James J. Gitomer, Esquire, representing the Respondent; the Respondent; and Robert J. Gilber, Assistant Attorney General, who was observing.

**Summary of Evidence**

At the hearing, the State introduced the following evidence. No witnesses testified for the State.

1. The 1988 General Assembly, by Senate Bill No. 508 and House Bill No. 855, merged the functions of the former Commission on Medical Discipline and the former Board of Medical Examiners into the new Board of Physician Quality Assurance. The General Assembly also amended *Health Occupation Article §14-504* by repealing §14-504(6) and enacting §14-504(b). §14-504(b) requires the Board to suspend a license if the licensee is convicted of a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside. In addition, after the completion of the appellate process, if the conviction has not been reversed or the plea has not been set aside with respect to a crime of moral turpitude, the Board shall order the revocation of a license. Under this repeal and amendment, the grounds for discipline set forth in §14-504(b) remain the same, but the Board's discretion as to sanction is removed. Because the conviction or plea herein occurred prior to the effective date of the Act, the charge is issued under former §14-504(6) of the Act and the former provisions regarding sanctions will apply.

**State Exhibit 1:** The True Test Copies of the Certification, Order of Court, Criminal Information, and Statement of Facts for cases number 18533701 and 28609326, and the Indictment in case number 18533701, consisting of twenty-three pages.

**State Exhibit 2:** A copy of the letter from the Offices of the Attorney General Medicaid Fraud Control Unit to Andrew Radding, Esquire, dated April 2, 1986, noting the details of the Plea Agreement reached between the State and the Respondent, consisting of five pages.

The State rested its case on the above Exhibits. Respondent submitted the following documents for inclusion into the record without any objection from the Administrative Prosecutor.

**Respondent Exhibit 1:** Letters of Recommendation referring to Respondent from the Section Officer of the University of Delhi, Faculty of Law, dated May 5, 1989; Section Officer Administrator of the University of Delhi, Faculty of Law, dated June 29, 1989; M.S. Shukla, Associate Professor, Law Faculty, University of Delhi, Faculty of Law, dated July 28, 1989; Bhushan Tilak Kaul, Lecturer, Law Faculty, University of Delhi, Faculty of Law, dated July 28, 1989; Stephen R. Smith MD, FACP, dated January 2, 1986; and Victor R. Hrehorovich MD, Director, Department of Medicine, South Baltimore General Hospital, dated February 5, 1986, consisting of seven pages.

**Respondent Exhibit 2:** A blank letterhead for Respondent indicating his professional title and address in New Delhi, India. It is undated, consisting of two pages.

Respondent testified on his own behalf. No other witnesses testified for Respondent.

By letter dated October 12, 1989, the Hearing Officer forwarded to Respondent's counsel and the State the Proposed Decision in this case which contained Proposed Findings of Fact, Proposed Conclusion of Law, and a Recommendation. The Hearing Officer notified the Respondent and the State of the right to file exceptions with the Board and stated that any exceptions should be filed within twenty-one days of receipt of the Proposed Decision. By letter dated February 20, 1990, the Board notified the Respondent and the State that it had received no exceptions. The parties were informed that the case would be scheduled for Board action on Wednesday, February 28, 1990.

On Wednesday, February 28, 1990, the Board considered the Proposed Decision, and by clear and convincing evidence and on the affirmative vote of a majority of the full authorized membership of the Board, issued a Proposed Decision. The Decision issued was proposed because the sanction was more severe than recommended by the Hearing Officer.

By letter dated March 22, 1990, the parties were forwarded the Board's Proposed Decision, and informed that exceptions must be filed by April 4, 1990 and that the Board would hear the case on April 11, 1990. On March 29, 1990, Respondent filed exceptions. The State filed no exceptions. At its meeting on Wednesday, April 11, 1990, the Board heard arguments from the parties. Based on clear and convincing evidence on an affirmative vote of the majority of the full authorized members of the Board, the Board issues the following Final Decision.

## Findings of Fact

1. The Board of Medical Examiners issued License Number D 19488 to Respondent on August 9, 1976.

2. On April 7, 1986, Respondent pled guilty to Medicaid Fraud in Baltimore City Circuit Court, Case Number 28609326, *State of Maryland v Rakesh Chandra*, and was found guilty and convicted of same. Respondent was sentenced to one year in the Department of Corrections, starting on April 9, 1986, with four months suspended. Following release, Respondent was to be placed on probation for three years.

3. On April 7, 1986, Respondent pled guilty to Obstruction of Justice in Baltimore City Circuit Court, Case Number 18533701, *State of Maryland v Rakesh Chandra*, in violation of Article 27, §27 (Common Law Conspiracy). Respondent was found guilty and sentenced to one year in the Department of Corrections, suspended four months dating from April 9, 1986 to be served in Baltimore City work release, and upon release, three years supervised probation. Respondent was ordered to pay restitution of \$110,000 with \$40,055.08 to be paid in open court. This sentence was later modified on June 3, 1986, to suspend all remaining time of incarceration.

4. The Statement of Facts to which the Respondent pled guilty provides the details of the criminal activities which are found to involve moral turpitude.

- a. At all times relevant to the Indictment and Information contained in State Exhibit 1, Respondent was an approved provider in the State Medicaid Program as a psychiatrist.
- b. During the period January 1981 through September 1985, Respondent billed Medicaid for services purportedly provided to Medicaid recipients, primarily for psychotherapy conducted by him and his employees who were non-physician, licensed social workers.
- c. All invoices for psychiatric services rendered were signed by Respondent, and each invoice included the code number representing the service rendered and stated the amount charged for the service.
- d. Based on the invoices, the Medicaid Program made payments to Respondent for the period 1981 through 1985 for psychotherapy billed at the maximum amount possible (i.e., fifty-minute therapy sessions) regardless of the amount of time he spent with the patient. Some patients were seen for only ten or fifteen minutes, and some patients were seen only to review and renew their prescriptions for medication. Respondent's billing clerk, therapists employed by Respondent, and numerous patients, verified information regarding Respondent's billing practices to Medicaid.
- e. In December 1984, the grand jury subpoenaed Respondent's 1984 appointment book.

(1) The appointment book submitted on behalf of Respondent supported his billings as submitted to Medicaid for fifty-minute therapy sessions.

- (2) In December 1985, Respondent's billing clerk and social worker therapists were subpoenaed before the grand jury and disclosed that the 1984 appointment book submitted to the grand jury was fabricated, and that the actual appointment book would show the scheduling of many of Respondent's appointments at intervals of every fifteen minutes.
- f. Respondent also made false statements and over-billed on invoices to the Medicaid Program for psychotherapy allegedly conducted with patients at South Baltimore General Hospital.
- (1) Respondent instructed his billing clerk to bill Medicaid for fifty-minute therapy sessions on each day that one of his patients was hospitalized.
- (2) The majority of the documentation, in the form of progress notes, was performed by unlicensed medical students/interns at the hospital, and Medicaid regulations require that the billing physician personally documents the visits.
- (3) In the majority of cases, Respondent, when he came to the hospital to see patients, would see them only during rounds rather than conducting individual psychotherapy with the patients.
- g. Respondent also billed the Medicaid Program and was paid for services of licensed Certified Social Workers performed without his supervision.
- h. Respondent's patient files revealed many instances in which there was no documentation of the visit for which the Medicaid Program was billed and for which the Respondent was paid.
- (1) In December 1984, a subpoena was issued to Respondent for his patient files.
- (2) Respondent instructed his therapists to go back to their patient files and document visits for the prior two years.
- i. The amount of the billings to the Medicaid Program for which Respondent was reimbursed as a result of false statements on invoices submitted to the Medicaid Program was in excess of \$36,666.66 during the period of 1981 through 1985.
5. The commission of Medicaid Fraud, in violation of Article 27, §§230B and 230C, is a crime of moral turpitude.
6. The commission of Obstruction of Justice, in violation of Article 27, §27, is a crime of moral turpitude.
7. Respondent did not appeal his convictions and has completed fulfilling the terms of his criminal probation.

#### Board's Response to the Exceptions

Exception #1 states: The Respondent's case was considered by the Board on February 28, 1990. The Board accepts this exception.

Exception #2 states: That after the Board considered said case they issued a proposed decision which included Findings of Fact, Conclusions of Law, and an Order. The Board accepts this exception.

Exception #3 states: That in footnote No. 3 the Board concluded in its Findings of Facts the following:

However, Respondent has not taken any continuing education courses due to the expense. Similarly Respondent has not taken the American Board in Psychiatry since he cannot afford the refresher course. Additionally, in order to take same he would have to be a licensed physician. Respondent stated he would be willing to perform community service but only wants to perform same on weekends enabling him to work in a paying job during the week.

The Board accepts this exception.

Exception #4 states: A fair reading of the transcript of the proceedings prepared before the examiner would not support the Findings of Fact as above mentioned. For example, see the following:

A. *Transcript pages 55 through 57.* These portions of the transcript indicate that Dr. Chandra would be willing to take an overview course of psychiatry to brush up on what he believes might be some of his weaknesses. In addition, he indicates that if he had a license, he could and would take the APA course as long as he had some realistic expectation of employment.

The Board accepts this exception and has modified present footnote 4.

B. *Transcript page 29, lines 2 - 12.* This portion of the transcript does not indicate that Dr. Chandra is only willing to do community service on the weekends. It actually indicates he would prefer the weekends. However, on line 12, it is clear that he would be willing to do the community service at the Board's discretion.

The Board accepts this exception and has modified present footnote 4. The Board notes that this is a moot point since the Order requires no community service.

Exception #5 states: The above examples tend to portray Dr. Chandra as a person who would only abide by conditions as he sets them. This is a misunderstanding in that Dr. Chandra is more than willing to comply with any probation conditions or any other conditions the Board would mandate.

The Board notes this exception and deems that it needs no response as it relies on no transcript reference.

#### Conclusions of Law

Based on the Findings of Fact, all of which are supported by clear and convincing evidence, and having considered all the Hearing Officer's findings not related to the charges, and on an affirmative vote of a majority of the full authorized membership of the Board, the Board concludes as a matter of law that Respondent committed the following prohibited act:

is convicted of or pleads guilty ... with respect to a crime of moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside (HO §14-504(6)).

## Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 12th day of December 1990, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED that Respondent's, RAKESH CHANDRA MD, license to practice medicine in Maryland is hereby REVOKED; and be it further

ORDERED that on February 28, 1991, Respondent can apply for reinstatement of his license provided that he complies with the following conditions precedent.

- a. Respondent has completed fifty hours of Board approved Category I continuing education credits in psychiatry;
- b. Respondent has taken and passed the Special Purpose Examination (SPEX), receiving a grade of 75;
- c. Respondent has complied with all conditions of his court ordered probation; and
- d. Respondent submits to psychiatric and psychological examinations by a Board approved psychiatrist and psychologist. These examinations shall be at Respondent's expense. Respondent shall sign a release permitting the Board to forward all relevant documents to those professionals performing the examinations and a release permitting the examiners to forward their reports to the Board; and be it further

ORDERED that in considering Respondent's petition for reinstatement of his license, the Board shall consider the results of the reports and all relevant information; and be it further

ORDERED that if the Board decides to reinstate the Respondent's license, the Board may impose additional conditions relating to Respondent's practice of medicine; and be it further

ORDERED that this is a Final Order and as such is considered a public document pursuant to *State Government Article* §§10-617(h), *et seq*

## Comment

Medicaid fraud is one of the most serious violations of the Medical Practice Act that this Board is called upon to adjudicate. Physicians' billings for professional services, whether to the State or Federal governments or to private insurers, are done primarily on an honor system. Payors are overwhelmed by the volume and complexity of the billing process, and audit capability is limited. Society and the medical profession itself have a right to expect physician behavior in assigning money values to medical services to be scrupulously honest and accurate. Conscious and deliberate fraud in billing contributes to an increasing distrust of doctors, and is an offense against the honor and trust the great majority of physicians deserve.

In particular, fraud in the Medicaid system is espe-

cially censurable. This program is desperately underfunded and every misused dollar contributes to the problem of providing care to the indigent in Maryland. Frustration with perceived complexities and inequities of the Medicaid payment system is no excuse for physicians devising their own rules for dealing with it. All health professionals must rely on the accuracy of medical records. In spite of the date of the violation, this remains an egregious case.

The Legislature, speaking for the citizens of Maryland, has clearly articulated a policy for the Board to follow in these cases. The Board has chosen to use its discretionary powers and revoke Respondent's license. The Board, cognizant of the date of the violation, has given Respondent an opportunity to apply for reinstatement after an evaluation proves that he has rectified the flaws that lead to this action, and has the necessary competency to return to the practice of medicine in Maryland.

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

■   ■   ■

### In the Matter of Supoj Satogkit MD Before the Maryland Board of Physician Quality Assurance

### Final Order

Based on information received by the State Board of Physician Quality Assurance (the Board), the Board voted to charge Supoj Satogkit MD (Respondent) under *Md. Health Occupations Code Ann.* (HO) §14-504(a)(25)(i) (1989 Cum. Supp.) with underlying grounds §14-504(a)(2), (a)(3) and (a)(22). Charges were issued on July 16, 1990. Specifically, the Board charged:

- (a) Subject to the hearing provision of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:
  - (25) Was subject to investigation or disciplinary action by a licensing or disciplinary authority or by a court of any state or country for an act that would be grounds for disciplinary action under this section and the licensee:
    - (i) Surrendered the license issued by the state or country to the state or country ....

The grounds for disciplinary action under this section are:

- (2) Fraudulently or deceptively uses a license;
- (3) Is guilty of immoral or unprofessional conduct in the practice of medicine;
- (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

Respondent was notified of the date of a hearing and that if Respondent failed to appear, the hearing could be held *ex parte* under HO §14-505. A hearing was scheduled and held on August 27, 1990 before an Administrative Law Judge. Attending for the State was Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor. Respondent did not attend.

### Summary of Evidence

The State introduced the following evidence:

**State Exhibit 1:** Respondent's latest renewal application dated November 29, 1989.

**State Exhibit 2:** Certified mail receipt — charging letter dated July 16, 1990 to 101 Medical Boulevard, Hudson Bridge Road, Stockbridge, Georgia.

**State Exhibit 3:** Charging letter noting hand service dated July 16, 1990 to Respondent in Phoenix, Maryland.

**State Exhibit 4:** Investigator's memorandum dated July 16, 1990.

**State Exhibit 5:** Charging letter to 8650 Canal Street, Jonesboro, Georgia dated July 16, 1990.

**State Exhibit 6:** Charging letter to P.O. Box 14, Jonesboro, Georgia dated July 16, 1990.

**State Exhibit 7:** Affidavit of Respondent's father-in-law dated August 23, 1990.

**State Exhibit 8:** Receipt for Certified Mail to Thailand.

**State Exhibit 9:** Charging document dated July 16, 1989.

**State Exhibit 10:** A letter certifying authenticity dated March 29, 1990 from Andrew Watry, Executive Director, Composite State Board of Medical Examiners, State of Georgia (Georgia Board), attaching a Notice of Hearing, dated June 16, 1989, and Order of Summary Limitation and Restriction of License dated June 16, 1989.

**State Exhibit 11:** Voluntary surrender in case number 89-0324 before the Georgia Board.

By letter dated September 21, 1990, the Office of Administrative Hearings issued its recommended decision which included proposed Findings of Fact, proposed Conclusions of Law, and a Recommendation to the Board. The recommended Decision was sent to Respondent, the State, and the Board. The Administrative Law Judge advised the parties of their respective rights to file exceptions. This notice was sent to Respondent at the address given to the Board in Respondent's renewal application. By letter dated November 16, 1990, the Board informed the Respondent and State that the Board would consider the case at its meeting on November 28, 1990. The Board sent this notice to Respondent at three different addresses: his renewal address, an address in Maryland, and to Thailand, his address as given by his father-in-law.

At its meeting on November 28, 1990, the Board considered this case. On an affirmative vote of a majority of its full authorized membership, the Board decided as follows.

### Findings of Fact

Based on clear and convincing evidence, the Board finds that:<sup>1</sup>

1. The Board voted to adopt the Administrative Law Judge's recommended decision subject to revisions by Board counsel to reflect the facts set forth in the State's evidence and to more fully set forth the facts.

1. At all times relevant, Respondent was a physician licensed to practice medicine in Maryland.

2. On Respondent's renewal application, dated November 29, 1989, Respondent stated his address was 101 Medical Boulevard, Stockbridge, Georgia 30281.

3. The Board's charges, dated July 16, 1990, were sent by certified mail, return receipt requested, to Respondent at the above-referenced address.

4. The Board received a return receipt on July 23, 1990 signed by Joyce Williams.

5. The Board sent its charges to Respondent at three other addresses.

6. On August 17, 1990, Respondent's father-in-law telephoned the Administrative Prosecutor and informed the Administrative Prosecutor of Respondent's address in Thailand. An affidavit was signed to this effect.

7. The State sent another copy of the charges to Respondent at the Thailand address.

8. On June 16, 1989, the Composite State Board of Medical Examiners (the Georgia Board) issued a Notice of Hearing to Respondent stating that if the charges contained therein were proven, Respondent's license could be revoked or suspended. On June 16, 1989, the Georgia Board also summarily restricted Respondent's license. Respondent was not permitted to perform gynecological surgery or obstetrical procedures.

9. The Georgia Board charged, *inter alia*, that Respondent:

Knowingly made misleading, deceptive, untrue, or fraudulent representations in the practice of medicine or in any document connected therewith, or practiced fraud or deceit or intentionally made any false statement in obtaining a license to practice medicine, or made a false or deceptive annual registration with the Board (OCGA §43-34-37(a)(2)).

10. The Board may sanction a physician who: Fraudulently or deceptively uses a license (HO §14-504(a)(2)).

11. The Georgia Board charged that Respondent:

Engaged in any unprofessional, unethical, deceptive, or deleterious conduct or practice harmful to the public, which conduct or practice need not have resulted in actual injury to any person. As used in this paragraph, the term "unprofessional conduct" shall include any departure from, or failure to conform to, the minimal standards of acceptable and prevailing medical practice and shall also include, but not be limited to, the prescribing or use of drugs, treatment, or diagnostic procedures which are detrimental to the patient as determined by the minimal standards of acceptable and prevailing medical practice or by rule of the Board (OCGA §43-34-46(a)(7)).

12. The Board may sanction a licensee who:

Is guilty of ... unprofessional conduct in the practice of medicine (HO §14-504(a)(3)).

13. The Georgia Board charged Respondent:

The Board has the authority to refuse to grant a license to an applicant, or to discipline a physician licensed in Georgia if that physician has engaged in unprofessional conduct. For the purpose of the implementation and enforcement of this rule, unprofessional conduct is defined as, but not limited to, participating in or aiding the following:

(f) Any departure from, or the failure to conform to, the minimal standards of acceptable and prevailing medical practice. Guidelines to be used by the Board in defining such standards may include, but are not restricted to:

1. **Diagnosis.** Evaluation of a medical problem using means such as history, physical examination, laboratory, and radiographic studies, when applicable.
2. **Treatment.** Use of medications and other modalities based on generally accepted and approved indications, with proper precautions to avoid adverse physical reactions, habituation, or addiction.
3. **Records.** Maintenance of records to furnish documentary evidence of the course of the patient's medical evaluation, treatment and response. (Board Rule 360-2-09).

14. The Board may sanction a licensee for:

Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State (HO §14-504(a)(22)).

15. The acts upon which the Georgia Board based its charges were acts which would be grounds for disciplinary action under HO §14-504.

16. The Georgia Board scheduled a hearing on the charges in case number 89-324 on August 1, 1989.

17. On June 20, 1990, Respondent surrendered his license to practice medicine in Georgia as final disposition of the disciplinary proceedings in Case Number 89-324. On May 15, 1990, the Georgia Board accepted the surrender.

### Conclusions of Law

Based on the Findings of Fact, the Board concludes that Respondent:

Was subject to disciplinary action by a licensing or disciplinary authority ... for [...] acts] which would be grounds for disciplinary action under [HO §14-504] and the ... [Respondent] (i) surrendered the license issued by the State ... to the State ....

The grounds for disciplinary action under HO §14-504 are:

- (2) Fraudulently or deceptively uses a license;
- (3) Is guilty of ... unprofessional conduct in the practice of medicine;
- (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

### Order

Based upon the Findings of Fact and Conclusions of Law, it is hereby this 11th day of December 1990

ORDERED that Respondent's, Supoj Satogkit MD, license to practice medicine in the State of Maryland is REVOKED and be it further

ORDERED that this is a final order and as such is considered a public document pursuant to State Government Article, *Annotated Code of Maryland*, §§10-611, *et seq.*

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

## The Johns Hopkins Hospital

### PHYSICAL THERAPY OCCUPATIONAL THERAPY PHYSIATRY CONSULTATION SERVICE

Providing Rehabilitation Services  
including specialties in the areas of:

#### SPINE REHABILITATION

- Spinal evaluation and treatment
- Back School Education
- Postoperative back evaluation and treatment

#### ORTHOPEDICS

- Postoperative joint rehabilitation
- Rehabilitation of musculoskeletal injury
- Foot Orthotic evaluation/fabrication
- Prosthetic training
- TMJ

#### PEDIATRICS

- Evaluation and treatment of premature infants through adolescents
- Cystic Fibrosis Pulmonary and Exercise Programs

#### NEUROSCIENCES

- Chronic Pain Management
- Evaluation and treatment of neurological disorders
- Geriatric Fall Precautions Screening
- Multiple Sclerosis Patient Screening

#### MEDICINE

- Geriatric Assessment
- Arthritis evaluation and treatment
- High Risk Pregnancy
- AIDS Rehabilitation

#### SURGERY

- Amputee Rehabilitation
- Early postoperative intervention
- Postoperative organ transplantation rehabilitation

#### ONCOLOGY

- Rehabilitation Post Bone Marrow Transplantation
- Leukemia Rehabilitation

#### CARDIAC REHABILITATION

- Postoperative intervention
- Postoperative Heart, Lung and Heart/Lung Transplant Rehabilitation
- Phase 1 Cardiac MI program

#### PSYCHIATRY

- Pediatrics through Geriatrics
- Inpatient, Day Hospital, Outpatient

#### HANDS

- Static and Dynamic Orthotics
- Hand Surgery/Cumulative Trauma Rehabilitation

### Cancer Immunotherapy Part I: Basic and Early Clinical Trials

While surgery remains the most effective method in the management of most cancers, it has not been sufficient to handle the problem alone. Only about one-third of cancer patients will be cured by surgical resection only. Therefore, intensive efforts have been devoted to the development of new modalities for treating cancer. As most cancer patients die of distant metastases, systemic treatment modalities such as hormonal therapy, chemotherapy, and immunotherapy are being investigated.

There does exist clinical evidence of tumor immunity. Spontaneous regression of the disease may occur even in its metastatic stages; although the phenomenon is rare, it is well recognized in patients with hypernephromas and melanomas. In addition, fetuses of mothers with metastatic melanoma never develop melanoma and these fetuses are immune to developing melanoma both at the cellular and humoral levels.

Recurrences, however, do occur ten to thirty years after curative surgery. While such a phenomenon is well recognized in breast cancer, it occurs in all malignancies with varying degree. In reality, five-year survival is of no significant value in any malignancy other than in large bowel cancer. The presence of immune cells (i.e., mononucleated cells) at the primary site and histiocytes in the regional lymph nodes of cancer patients has been observed. It has been claimed that both findings carry a good prognosis. Tumor cells may be present in the peripheral circulation without tumor development or metastasis. The slow growth of tumors has been attributed to tumor cell death via immune surveillance. In addition, when immune surveillance fails, such as in aging, transplantation, and malnutrition, tumors of various types do develop.

It must also be remembered that cancer, except for genetically-related cancer, is more prevalent in older individuals.

In an effort to increase the host immune reactivity to cancer, several attempts have been made to develop immunotherapies for the treatment of cancer, including:

1. *Bacterial injections:* In the thirties, Dr. Cooley introduced bacterial injections into some tumors. Sixty years later, tumor necrosis factor (TNF) was identified and synthesized to recombinant tumor necrosis factor (rTNF) which is now being utilized alone, with chemotherapy, or more recently, with immunotherapy.
2. *Tumor cells and tumor extracts:* Postoperative immunization with fresh tumor cells (autologous or allogenic cells) or tumor cell lysates has been utilized as a tumor vaccine. Cultured tumor cells were also used until it was discovered that cultured tumor

cells may change antigenicity. In addition, some tumor cells may be protected by lipoproteins. Therefore, to strip that lipoprotein, neuraminidase-treated tumor cells were utilized in the immunization. Concanavalin-A was employed to increase antigenicity of tumor cell surface antigens.

#### 3. *Lymphocyte transfusions:*

- a. Fresh or cultured lymphocytes were transfused in cancer patients with the hope of increasing their general immunity.
- b. Another approach was the utilization of neuraminidase-treated lymphocytes, again to remove the lipoprotein coating on the surfaces of the lymphocytes to make them more competent immunologically. (Unfortunately, none of these approaches showed any effect. While we can transfer specific immunity to a specific disease, there is no evidence that we can transfer general immunity which will specifically affect a single disease.)
- c. Subsequently, cross tumor transplants and cross transfusions were attempted. In this approach, tumors from two individuals were cross-transplanted and the lymphocytes from these individuals were cross-transfused. This approach was premised by the fact that such tumors would be rejected on the basis of histoincompatibility and with the hope of recognizing tumor-associated antigens; consequently, cross transfusion would transfer tumor immunity. This approach had limited success.
- d. Immune-ribonucleic acid (RNA), obtained from the lymphoid tissue of animals sensitized to human tumors, was administered to the patients. This resulted in double hetero-immune rejection. Insufficient numbers of patients were studied for this to be conclusive.
- e. The use of the transfer factor of Lawrence was also attempted. A transfer factor of 11,000 molecular weight was obtained from the lymphocytes of breast cancer patients who had no evidence of recurrence or metastasis five years after surgery. The factor was administered to the patient with metastatic breast cancer, but failed to show any effect. It later became evident that patients with local and regional disease do recognize their tumors preoperatively, a phenomenon that disappears in the immediate postoperative period. These patients received extract of unsensitized lymphocytes and displayed no clinical evidence of response.

4. *Immune reconstitution:* Two agents have been used to reconstitute nonspecific immunity in cancer patients. Levamisole was utilized in combination

# YOCON®

## YOHIMBINE HCl

**Description:** Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

**Action:** Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

**Indications:** Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

**Contraindications:** Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

**Warning:** Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

**Adverse Reactions:** Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.<sup>1,2</sup> Also dizziness, headache, skin flushing reported when used orally.<sup>1,3</sup>

**Dosage and Administration:** Experimental dosage reported in treatment of erectile impotence.<sup>1,3,4</sup> 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.<sup>3</sup>

**How Supplied:** Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

with chemotherapy in breast and large bowel cancers. Thymosin was administered with radiation therapy. Both agents gave variable results.

5. *Immune stimulation* has been tried in various malignancies with the hope of stimulating general immunity. The two most commonly used agents were bacille Calmette Guerin (BCG) and *C. parvum*. While both failed to show systemic benefit, BCG has been an effective treatment as an intralesional injection in the management of local recurrence and limited satellitosis in cutaneous melanoma.
6. *Interferon therapy* has been successful in the management of some leukemias.

## A Medical Lexicon from Mythology

Bart Gershen MD

In last month's essay, I mentioned the fabled Greek Amazons and their nominal relationship to a South American river. Geographic names derived from mythology are rather common. Examples include: **Phoenix** (Arizona), named for the handsome Egyptian bird which built a funeral pyre and rose eternally from its own ashes; **Europe**, designated for *Europa* who was kidnapped by Zeus; **Olympia** (Washington), for the legendary heights of *Mount Olympus*, and **Rome** built by *Romulus*, the son of Mars. Each was the celebrated descendant of an ancient myth.

Medicine, too, has a lexicon which has descended from old legends. The Greek god of medicine was *Asclepius* (also known as *Aesculapius*). He was the son of Apollo, and was taught the art of healing by Chiron the Centaur. Asclepius is usually portrayed in a flowing white robe, carrying a cane with a serpent coiled around it. The **caduceus** - a winged staff with two serpents entwined about it is recognized as the symbol of medicine, but actually represents the emblem of a herald or courier; it was the staff of *Mercury*, messenger to the gods. In the mists of history, an egregious error has been committed -- the double-serpented rod, emblematic of Mercury, was substituted for the single-serpented one, which in fact represented Asclepius.

This is not terribly disturbing, until you consider that Mercury represented, among other things, the god of trade, of commerce, and of wealth, as well as the god of thieves. His duties, moreover, included conducting the souls of the dead to Hades.

We should, perhaps, have chosen our cardinal symbol more circumspectly.

Asclepius had two daughters, *Hygeia* and *Panacea*, who are likewise renowned in medical circles. You may also remember that Asclepius was physician to Jason and his Argonauts, all of whom were sent on a dangerous quest to obtain the Golden Fleece. They found it in *Colchis*, a region at the eastern end of the Black Sea - now part of Georgia, USSR.

A lovely flower grows in that part of the world. A member of the lily family, it blooms in late autumn and displays an array of pink, purple, and white petals. The plant is named for the region: *Colchicum autumnale*. Its underground stem is usually quite distended and contains an anti-inflammatory substance. Asclepius used it to treat rheumatism and gout. We call it *Colchicine*.

*Mercury* was called *Hermes* by the Greeks. Among other things, Hermes was the father of alchemy. Alchemists were the first to use intense heat to soften metals. To bind objects together with hot molten ore has, therefore, become known as *hermetic* sealing.

*Aphrodite*, one of the twelve Olympic gods, was famous for her beauty and her notorious adultery. She

was married to the grotesque and repulsive *Vulcan* god of fire (**volcano** and **vulcanism**). Hence, she often imported paramours to gratify her lust - occasionally resorting to **aphrodisiacs** in order to achieve these ends. Among her lovers was Hermes with whom she conceived a son. The baby was named for both parents: *Hermaphroditus*. As he grew into handsome maturity, a water nymph, Salmacis, fell in love with him. She could not tolerate a moment's separation from her sweetheart, so she joined her spirit to his. They occupied the same body, which came to possess both male and female sexual characteristics - a **hermaphrodite**.

*Aphrodite* was known to the Romans as *Venus*. She was the goddess of beauty, the mother of love, and the mistress of pleasures. One of her children was *Eros*, the god of love. A second child was *Hymen*, the god of marriage. The third child was *Priapus*, god of fertility. **Priapism**, **hymen**, and **erotic** are their medical cognates. In addition to her enchanting progeny, Venus has furnished us with a wealth of **venereal** disease as well.

Other characters from ancient mythology have augmented our vocabulary, such as *Psyche*, goddess of the human soul, and *Narcissus*, the beautiful youth who fell in love with his own reflection. One must also include the sea god *Proteus*, who had the ability to assume various shapes. Thus have we termed the bacterial genus **Proteus**, and discovered the origin of that ubiquitous expression of sophomoric rhetoric: "**protean** manifestations of disease."

The Greek god of forests and wild animals was *Pan*. He was patron of shepherds and hunters, and flaunted the ears, horns, tail, and inguinal parts of a goat. The less spectacular aspects of his anatomy were those of a man. He was playful, frisky, lustful, libidinous, and unpredictable. One of his favorite diversions was to frighten unwary travelers as they wandered through his forest; hence he incited **panic**.

*Pan* was one of a group of woodland deities known as *satyrs*. They attended Bacchus, god of wine, and are renowned for a disorder known as **satyriasis**, which requires a goat-like constitution as well. It is the masculine counterpart of **nymphomania**. Pan was also venerated by the Romans, but they renamed him *Faunus*. Debussy's orchestral work, *Prelude a l'apres-midi d'un faune* (Prelude to Afternoon of a Faun), exalted these woodland creatures. In addition, the renowned Swedish physician and botanist, Dr. Carl Von Linne, immortalized them in his seminal classification of plants and animals - calling them flora and **fauna**. (Incidentally, you may recognize this distinguished scientist only by his latinized name: *Carolus Linnaeus*.)

*Saturn* was the Roman god of agriculture. His temple served as the Roman state treasury. Its vestiges can still be found at the west end of the Forum. A great festival, the Saturnalia, was held each December in his honor. It was the most popular and joyful of Roman festivals. Business was suspended, slaves were granted temporary freedom, moral constraints were relaxed, and gifts exchanged. Its influence remains with us today, contrasting with our more civilized hibernial celebrations.

During that era, astronomers became aware of five unique stellar objects. They knew that most stars were "fixed" in position, each relative to the others, and that they rotated nightly from east to west in the dome of the sky. This was true for most stars, but not for five idiosyncratic "stars" which wandered aimlessly through the heavens, apparently pursuing their own enigmatic destinies. The primitive cosmologists called these bizarre objects **planets** (Greek: *planetes* - "wanderer"). One of these - the outermost planet visible to the naked eye - was named **Saturn**, in honor of their god. It was a very slow-moving celestial body, hence the alchemists hypothesized that it must have been made of lead - the heaviest known element of that period. Therefore, to have a **saturnine** disposition means to be heavy, plodding, morose, and rather gloomy.

Furthermore, chronic **lead** poisoning became known as **saturnism**, and since lead blocks the excretion of uric acid, the resulting disorder became known as **saturnine gout**. Of course, the actual Latin word for lead was *plumbum*, from which our chemical symbol **Pb** is derived. This likewise explains the alternate term for lead toxicity - **plumbism**. It also explains why one calls a **plumber** when the pipes leak - since all water pipes were originally fabricated from lead. (That may, in turn, explain the fall of the Roman Empire.) Finally, it explains why the builder constructed your home with such a scarcity of true right angles. He failed to hang a heavy lead weight on a string to obtain a perpendicular - he did not use a **plumb line**.

*Amon* or *Ammon* was the chief god of the Egyptians and patron of the pharaohs. Shortly after Alexander the Great conquered Egypt, his troops constructed a magnificent temple near an oasis in the North African desert. In honor of the chief divinity of each country, they called it the temple of *Zeus-Ammon*.

Desert nights can become quite cold; therefore, fires were often lit to warm the tabernacle. Fuel is scarce in such barren regions, so the worshipers used dry camel

dung as kindling - much as Native American Indians employed buffalo chips.

Over the years, grayish soot from the rising smoke was deposited onto the walls and ceiling of the temple. It solidified into a white crystalline, salt-like substance. In fact, it was known as the "salt of Ammon," or *sal ammoniac*.

In 1774, Joseph Priestley, a Unitarian minister and good friend of Benjamin Franklin, collected a pungent, irritating vapor from crystals of sal ammoniac. He called this new gas **ammonia**. Today we know that sal ammoniac is **ammonium chloride**. We also know that loss of one of the three hydrogen atoms surrounding ammonia results in an **amino** group -  $\text{NH}_2$  - the basis for all **amino acids** and for all protein-based life. Accordingly, each of us carries with us the lexical seeds of the Egyptian god *Ammon*.

Finally, there is the legend of the *Sphinx* - the fabled monster which brandished the head and breast of a human, and the body of a lion. It guarded the city of Thebes and as each traveller approached the gates to the city, the ogre would stop him and ask a mysterious riddle. If the wayfarer failed to solve the conundrum, the Sphinx killed him instantly by crushing him to death.

One day a man approached the city. His name was *Oedipus*. The Sphinx asked his riddle: "What is it that walks on four feet in the morning, two feet at noon, and three in the evening?" Oedipus responded correctly: "It is man, who crawls on all four feet in youth, stands on two in maturity, and uses a crutch in old age." The furious Sphinx, in a violent rage, strangled himself to death - giving paradoxical life to the word **sphincter** - that which squeezes.

It may also be of some interest to note the origin of the young hero's name. When Laius, the king of Thebes, learned that his wife Jocasta was to have a child, he consulted an oracle. The seer prophesied that this infant son would grow to manhood, murder his father Laius, marry his mother Jocasta, and ascend to the throne. Laius immediately ordered the infant destroyed. He gave the child to a herdsman who **pierced the baby's feet** and left him dangling from a mountain cliff, exposed to the elements. A passing shepherd took pity on the unfortunate infant, saved his life, and the rest, as they say, is history.

The child was named **Oedipus** - from the Greek *oidein*: "to swell" (as in **oedema**) and *pous*: "foot."

The boy with **swollen feet**. ■

**Howard A. Zacur MD, PhD**, a specialist in infertility, is the new Director of the Division of Reproductive Endocrinology at The Johns Hopkins Medical Institutions. Well-known as a clinician and a researcher, Dr. Zacur is also an Associate Professor and the Deputy Director of the Department of Gynecology and Obstetrics, as well as holding a joint appointment with the Department of Population Dynamics at the School of Public Health.

A graduate of Harvard College and the University of Miami School of Medicine, Dr. Zacur completed his residency in gynecology and obstetrics while also receiving his PhD in reproductive biology. He subsequently completed a fellowship in reproductive endocrinology in the Department of Gynecology and Obstetrics.

The first recipient of the annual J. Donald Woodruff Teaching Award, Dr. Zacur is a member of the editorial board of *Current Opinions in Obstetrics and Gynecology* and *Prologues* (a national newsletter on clinical and scientific developments in endocrinology), an ad hoc reviewer for nine journals, and author of more than eighty publications.

**Paul N. Manson MD**, an internationally known expert in craniofacial surgery, the repair of facial injuries, and the fastening of fractured bones, has been appointed Chief of the Division of Plastic Surgery at The Johns Hopkins School of Medicine and Chief of the Plastic Surgery Service at The Johns Hopkins Hospital. A Professor of plastic surgery at Hopkins since 1987, Dr. Manson also serves as Director of the Plastic Surgery Service at the Maryland Institute of Emergency Medical Services Systems.

Dr. Manson, whose research interests include bone healing, the metabolism of tissue that has had a damaged blood supply, and the physiology of facial injuries, received his BS in analytical chemistry and his MD from Northwestern University. He served a surgical internship at Boston City Hospital, and a general surgery residency at the Boston City and the New England Deaconess Hospitals. He was a fellow at the Lahey Clinic in 1973, and completed his plastic surgery residency at Hopkins in 1978.

A member or fellow in more than two dozen medical societies, he is President of the John Staige Davis Society of Plastic Surgeons of the State of Maryland, and serves as a consultant for the Veterans Administration Hospital in Baltimore and the Walter Reed Army Medical Center in Washington, DC. He has served on the editorial board or as a reviewer for eight peer-reviewed medical journals including the *Journal of Craniofacial Surgery* and *Thermology*. ■

## PHYSICIAN'S RECOGNITION AWARD

### Recipients

During the month of February 1991, the physicians listed below received the American Medical Association's (AMA's) Physician's Recognition Award. Established in 1968, the Award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

Abundo, Glenn Paulino  
Ballesteros, Ruben F.

## HCFA Regional Meeting: Physician Payment Reform

*Roseanne M. Matricciani RN, Esquire and Angelo J. Troisi FACHE*

In its efforts to keep the physicians of Maryland informed about issues concerning physician payment reform (PPR), Med Chi hosted a regional meeting on February 11, 1991 at the Faculty Building. Representatives from the Health Care Financing Administration (HCFA), led by Maurice Hartman, Regional Administrator, updated Region III's medical societies on PPR issues.

One of the first items discussed was Comparative Performance Reports (CPR). CPR letters have been released to physicians in an informational effort to alert those doctors who have billed Medicare for an unusually large number of services or procedures in comparison to their peers. In New Jersey and in Region III (which consists of Maryland, Pennsylvania, DC, Delaware, and Virginia), only 562 physicians received CPR letters. This number is approximately 8 percent of the physicians in the Region III/New Jersey area. Thirty percent of the physicians receiving CPR letters responded to the letter and provided the carrier with changes in coding, billing, specialty certification, etc., in order to correct and update the carrier's data base.

At the present time, the Regional Office indicates that there are a very small volume of physicians for whom ten or more claims have been submitted by beneficiaries. This fact is true nationwide and HCFA has instructed carriers to send out educational letters to those physicians who have not been complying with the law.

In an effort to address the "physician hassle factor," HCFA started a demonstration project beginning March 1, 1991 which will continue through March 31, 1992. This project involves releasing Medicare's payment screens in thirteen states. The project will study seven national screens -- routine foot care, comprehensive office visits, skilled nursing facility visits, chiropractic care, intermediate hospital visits, consultations, and comprehensive visits in all settings. However, the number and choice of screens to be released will vary from carrier to carrier. The states involved in the project are Alabama, Arkansas, California, Colorado, Connecticut, Georgia, Idaho, Indiana, Kansas, Kentucky, New York, Texas, and Wisconsin. HCFA is releasing these carrier screens to physicians to test physicians' responses to this information. HCFA is also trying to achieve consistency between carriers' screens and the Peer Review Organization's (PRO's) screens.

Furthermore, in an effort to address physician problems, carriers have been given more money by HCFA to train personnel and provide more information to the doctors. Maryland Blue Cross/Blue Shield has received additional funds to cover costs associated with this endeavor. At the present time, there is not enough money in the budget to provide a toll-free (800) number to physicians who have inquiries about their claims.

HCFA announced the creation of a new Advisory Committee on Medicare-Physician Relationships. This Committee will be a separate and distinct group from the Medicare Practicing Physician Advisory Council which was established by the anti-hassle legislation included in the Omnibus Budget Reconciliation Act of 1990 (OBRA 90). The new Advisory Committee will be chaired by Dr. Nancy Gary, Senior Medical Advisor to the HCFA Administrator, and will include seven practicing physicians representing primary care, internal medicine, and surgical specialties. While the Medicare Practicing Physician Advisory Council is expected to be a standing advisory group, Dr. Gary's Committee is only expected to meet five times and cease existence after December 31, 1991. The Advisory Committee is an effort by Health and Human Services Secretary Louis Sullivan MD and Dr. Gail Wilensky to undertake a retrospective review and obtain physician input on existing Medicare policies.

In an attempt at standardization of fees, HCFA has identified the need to define place of service and type of service. HCFA's most controversial effort, however, involves its rebundling project which started February 1, 1991. Under this project, certain codes are being identified that can be bundled together. This process will change billing procedures so that procedures will not be billed separately. The next phase of rebundling will occur in the summer.

Another topic of discussion was the Medicare Volume Performance Standards (MVPS). The MVPS for 1990 was 9.1 percent. Because of the cutbacks under OBRA 90, however, the MVPS for 1991 will be 7.3 percent for *all* services, but the increase is limited to 3.3 percent for surgical procedures and 8.6 percent for non-surgical procedures. This MVPS is smaller than the rates recommended by HCFA and the Physician Payment Review Commission (PPRC).

HCFA also stated that the geographic practice cost index (GPCI) for malpractice is being revised since its publication in the model fee schedule. While the PPRC has recommended that all but eleven states should have statewide GPCIs, at the present time, only Oklahoma, Kentucky, and Louisiana will have statewide GPCIs.

In a further effort to standardize fees, HCFA published its national standardization of global surgery policy in the January *Federal Register*.<sup>1</sup> Under this policy, global surgery will include the following:

1. All normal pre-operative visits, in or out of the hospital, made by the primary surgeon from the time of the consultation when the decision to have surgery is made;
2. Intra-operative services that are normally a usual and necessary part of a surgical procedure;

3. Complications following surgery, except where highly unusual circumstances could not have been anticipated;
4. Postoperative visits within ninety days after the date of surgery; and
5. Postoperative services related to minor surgery or scopy procedures occurring within thirty days of the date the procedure is performed.

The initial evaluation and/or consultation by the primary surgeon will be paid for separately. According to HCFA, this service is a distinct, readily identifiable service that is furnished whether or not surgery is performed. HCFA's deadline for commenting on the global surgery policy was March 11, 1991.<sup>2</sup>

In April 1991, the proposed fee schedule regulations will be published in the *Federal Register*. The comment period for these regulations should be sixty to ninety days. In October 1991, the final fee schedule regulations will be published in the *Federal Register*.

While the meeting with HCFA provided the medical societies with many informational items and allowed the societies to comment upon and question various policies, everyone agreed that another meeting would be beneficial. Therefore, HCFA will be holding another regional meeting in Washington, DC so that they can continue to update and communicate with the medical societies.

Med Chi is committed to keeping the physicians of Maryland informed about Physician Payment Reform (PPR). The Faculty will continue to make HCFA aware of the concerns of Maryland physicians and the effects of PPR on quality of care, practice, and access issues.

### Suburban Hospital Hosts Medical Students From The Union of Soviet Socialist Republics

On Friday, December 14, 1990, four senior medical students from the Soviet Union visited Suburban Hospital. The students were from the First Moscow Medical Academy -- the oldest medical school in the Soviet Union. They participated in two medical conferences as well as making ward rounds. The Soviet students, Yaroslav Grusha, Andrew Osipov, Maria Dolgopiatove, and Natalia Polushkina spoke English fluently and were animated participants during the bedside teaching rounds, impressing the Suburban Hospital physicians who were acting as their guides and tutors.

Dr. Harvey Resnick, a member of the Department of Psychiatry, was responsible for arranging their visit to our hospital. Dr. Resnick is the mid-Atlantic representative for the exchange program based at Columbia Presbyterian Hospital in New York City.

Dr. Eugene P. Libre, Medical Training Officer introduced the students at the end of the Internal Medicine Clinical Review Conference which had been given by Dr. Alan Singer on "Complications in The Diabetic Foot." Each student spoke for a few minutes about their origins, what their interests in Medicine were, and what they had done in the United States for the past three months as part of the exchange program.

"Use of Light Therapy in the Treatment of Seasonal Affective Disorders," was presented by Douglas Moul MD from the Clinical Psychopharmacology Branch of

Left to right: Douglas Moul MD, Gordon Wallace PhD, Eugene P. Libre MD, Andrew Osipov, Maria Dolgopiatove, Harvey Resnick MD, Natalia Polushkina, and Yaroslav Grusha. (Photo courtesy of John Davidson and Hilary Murphy, Public Relations Department, Suburban Hospital)

NIMH, and Gordon Wallace PhD, President of Biobrite, Inc. during Psychiatry Grand Rounds. The conference showed how to diagnose and treat these disorders using light therapy. (The photograph shows Dr. Wallace wearing the light therapy device used in treatments.)

Drs. Eugene P. Libre, Richard H. Pollen, James Salander, David Satinsky, James Kneppshield, Mohasan Gharib, and Joseph Mock showed the students how a typical American hospital cares for patients.

## Med Chi's 1991 Legislative Rally

**L**ieutenant Governor Melvin A. Steinberg addressed the more than eighty people who attended Med Chi's legislative rally in Annapolis on Tuesday, March 5, 1991. During his speech, the Lieutenant Governor said he was impressed by the number of physicians participating in the rally and emphasized the importance of physicians representing their profession before the legislature. Senate President Thomas V. "Mike" Miller also spoke on the need for physicians to maintain a voice in Annapolis and pointed out that organized medicine in Maryland originated in the legislature.

Med Chi President Reynaldo L. Lee-Llacer MD elaborated on the message sent by Lieutenant Governor Steinberg and Senator Miller stating... "Organized medicine gets its strength from the unity of purpose of all physicians." According to Dr. Lee-Llacer, that purpose is to uphold standards for high quality medical care.

Med Chi supported several bills promoting better health for Maryland's citizens. Physicians at the rally testified on a number of bills including several anti-smoking bills in the House Ways and Means Committee. Med Chi lobbyist, Gerard E. Evans, Esq., and Robin Shaivitz, lobbyist for the Maryland Divisions of the American Cancer Society, American Lung Association, and American Heart Association, encouraged physicians to speak out in favor of several anti-smoking bills. Included among this legislation

are three bills that would restrict the sale of tobacco products via vending machines (H.B. 39, H.B. 662, and H.B. 663); two bills that would place additional taxes on all tobacco products (H.B. 695 and H.B. 707); and one bill that would revoke licenses for vendors who sell cigarettes to minors (H.B. 673).

Regarding Med Chi's strong support of the anti-smoking legislation, Senate Finance Committee Chairperson Thomas Patrick O'Reilly said, "It's good to see so many doctors taking a stand against smoking."

Physicians also testified before the Senate Finance Committee and House Environmental Matters Committee regarding other legislation. Many of the bills discussed would adversely affect the practice of medicine in Maryland, such as H.B. 678, a bill that would amend current law and require physicians whose practice is considered unconventional or experimental to have their patients sign an informed consent form.

Other legislators who spoke during the rally include, House Environmental Matters Committee Vice Chairperson Virginia M. Thomas, Senator Paula C. Hollinger, Delegate Joan B. Pitkin, Senator Janice A. Piccinini, Delegate Jennie M. Forehand, Delegate Rosemary M. Hatam Bonsack, Delegate Marsha G. Perry, and Delegate Joseph Vallario. Prince George's County State's Attorney Alex Williams also addressed the physicians. ■

## MISCELLANEOUS MEETINGS

- May 8-10** 193rd Annual Meeting of the Medical and Chirurgical Faculty of Maryland - "American Medicine Today: Perspectives from Maryland," at the University of Maryland, University College, Center of Adult Education, College Park, MD. 15 Cat 1 AMA/PRA credits. Fee: no charge for Med Chi members; \$225 for nonmember physicians. Info: Michael Moran, Convention Director, 1-800-492-1056 in MD, or 301-539-0872.
- May 15-17** Clinical Auscultation of the Heart, sponsored by the American College of Cardiology at the Georgetown University Medical Center, Washington, DC. Info: 301-897-5400.
- May 15-19** 43rd Annual Meeting and Scientific Session of the Maryland Academy of Family Physicians, at the Sheraton Ocean City Resort and Conference Center, Ocean City. 30.75 Cat 1 AMA/PRA credits; 30.75 AAFP prescribed hours. Fee: \$195 members; \$225 nonmembers; \$110 paramedicals. Info: Brad J. Cooper MD, 301-747-1980.

Shady Grove Adventist Hospital, 9901 Medical Center Drive, Rockville, MD. Info: 301-279-6000.

- May 2** Breast Conservation Surgery for Carcinoma  
**May 9** New Advances in Treatment of Asthma  
**May 16** Functional Endoscopic Sinus Surgery  
**May 23** The Complicated Coronary Artery Bypass Patient  
**May 30** Latest Advances in Abdominal Radiologic Interventions  
**June 6** Recent Advances and Update in Oral & Maxillofacial Surgery: Dental Implants and Orthognathic Surgery  
**June 13** Mechanisms and Treatment of Head Injuries  
**June 20** Update in Pediatric Orthopedic Surgery  
**June 11** Surgical Management of Mitral and Aortic Valve Disease

American College of Emergency Physicians, 1211 Cathedral Street, Baltimore, MD. Info: 301-727-2237.

- May 2, June 27** Board of Directors  
**May 10** Annual Meeting, in conjunction with Med Chi's Annual Meeting  
**June 6** Executive Committee Meeting

### Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

#### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degrees, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles.

Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both the principal author and **MMJ**.

\* \* \*

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Baltimore St., Baltimore, MD 21201 (301-328-3956) or by calling the phone number listed after a specific program. FAX 301-328-3103.

- May 2** **Eleventh Annual Abraham H. Finkelstein Lecture on The State of the Family: An Environmental Perspective**, at the Medical School Teaching Facility. Cat 1 AMA/PRA credits available. Info: Bonnie Winters, 301-328-6777.
- May 2-5** **4th Annual Trauma Anesthesia and Critical Care Symposium**, at the Hyatt Regency, Baltimore, MD. 25 Cat 1 AMA/PRA credits. Fee: \$495/\$550. Info: 301-328-2628.
- June 5** **Subspecialty Care in General Practice**, at the University Club, Baltimore, MD. 1 Cat 1 AMA/PRA credit per date. Fee: \$50. Info: 301-328-3103.
- June 7-8** **Current Practical Concepts in Endocrinology and Metabolism**, at Harbor Court Hotel, Baltimore, MD. 10 Cat 1 AMA/PRA credits. Fee: \$150.
- June 23-28** **17th Annual Family Medicine Review Course**, at the Carousel Hotel, Ocean City, MD. 20+ Cat 1 AMA/PRA credits; 20+ AAFP prescribed hours. Fee: \$395.
- June 27-28** **10th Annual Update in Obstetrics and Gynecology**, at the Annapolis Waterfront Hotel, Annapolis, MD. 14 Cat 1 AMA/PRA credits; 14 ACOG cognates. Fee: \$225.
- June 28-30** **Dermatology Days**, at the Carousel Hotel, Ocean City, MD. 14 Cat 1 AMA/PRA credits; 14 AAFP prescribed hours. Fee: \$250.

## Continuously Throughout the Year

**University of Maryland Dean's Conferences** - Held monthly, October through April. Designed for the family/general practitioner and internist. Each conference highlights different clinical departments placing emphasis on the practical methods being used and researched at the University of Maryland. Extension programs are being planned to complement the programs held on the University's Baltimore campus.

**Visiting Professor Program** - A directory of speakers and their topics is available to area hospitals and other health care organizations. NO administrative fees are charged for this service. Info: 301-328-3956.

**Visiting Practitioner Preceptorships** - Opportunities for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Hour-for-hour Cat 1 AMA/PRA credits available. Direct all inquiries to CME 301-328-3956.

**Departmental Rounds and Conferences** - Weekly, hands-on and lecture presentations hosted by the University's clinical departments. Hour-for-hour Cat 1 AMA/PRA credits available. Brochure available.

## BOOK REVIEW BOOK REVIEW BOOK REVIEW BOOK REVIEW BOOK

*Transformations in American Medicine*. Lester S. King MD. Baltimore: The Johns Hopkins University Press, 1990, 243 pages. \$38.00

The author lists two of his previous publications in the "Notes" following the manuscript: *The Medical World of the Eighteenth Century* (1958) and *The Philosophy of Medicine: The Early Eighteenth Century* (1978). This text appears to be a collection of his references from his previous publications and from literature reviews over many years. The "Notes" are both extensive and excellent.

The author cites references from Galen (130-200 A.D.) to Cecil's *Textbook of Medicine* (1985) and discusses the progress of European as much as that of American medicine. A more appropriate title for this book, based on its content and approach to medical progress, would have been *The Philosophy of Medicine*.

Neither the purpose of this text nor the audience for which it is intended is apparent to this reviewer. The author has done considerable research in the field of medical history, but his discursive style of writing diminished the reader's interest. The pleonasm and repeated suggestions of what will be discussed in each subsequent chapter are annoying. Much discussion is given to the classification and characterization of fevers but there are almost no references to childbirth,

surgical, anesthesia, or orthopedic progress in medical care, which gives a lack of balance to the text.

*Transformations in American Medicine*, because of its excellent "Notes," belongs in the library of anyone interested in the history of medicine. It is not, however, practical or useful for the practicing physician or medical student.

DEWITTE E. DELAWTER MD

Reviewer

### PHYSICIANS:

# When you choose Princeton, you're in good company.

“One thing I really like is the approach Princeton takes toward defending claims. Princeton follows a policy of taking defensible cases to court, instead of settling just to avoid the hassle of dealing with a case. I think that's a wonderful way to handle frivolous claims.”

*Dr. Dwight Fortier  
Pediatrician, Annapolis*

More than 90% of Princeton-managed cases disposed of by the courts are resolved in the policyholder's favor.

Princeton Insurance Company

## There's Always Room For One More.

Informed consent, ICD-9-CM coding, medical record documentation, physician-patient communication, AIDS and medical practice, emerging medical technologies, financial planning, legal aspects of medical practice, insurance options, office staff procedures, health care politics in the 90's, to mention a few.

We offer an ongoing schedule of timely, relevant, and concise Risk Management programs for you and your office staff, each specifically designed around the extra skills you need in today's practice of medicine. Developed by our member physicians, the programs feature expert speakers, convenient locations, and CME credits. Some even include premium discounts.

Our seminar evaluations tell us that we're doing things right, and our attendance figures speak for themselves. We'll look forward to seeing you at an upcoming program.

There's always room for one more!

In Bethesda And Potomac, Maryland

# One Choice Is Obvious

Anyone can build a large home in Potomac or Bethesda. But if you're willing to pay the price for luxury and convenience, you should also be getting a lot more for your money than just size and location. You should be getting a home that justifies its price down to every last detail. With noteworthy design.

Superior and innovative energy conservation techniques. Craftsmanship. And exceptional quality control.

Exactly the things our industry and peers have considered when, for over a decade, they've consistently honored Mitchell & Best with local, regional and national awards in all four categories.

And that's important to know. Because it means you'll always be able to choose the very finest home. A home that's more than just impressive to look at... a home that is a certified winner in every way. And not just because we say so.

# **Making the right choices means asking the right questions.**

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which

questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

*Jerome P. Reichmister MD*
- Stroke in the Young (Part 1)** . . . . . 453  
*Barney J. Stern MD, Steven Kittner MD, MPH, Michael Sloan MD, Constance Meyd MD, David Buchholz MD, Daniele Rigamonti MD, Robert Woody MD, John Meyerhoff MD, William Bell MD and Thomas Price MD*  
Some of the more common disorders leading to stroke in the young, a relatively rare but serious problem, include cerebrovascular diseases, sources of emboli from the heart, migraine, drug use and abuse, and hematologic conditions.
- The Automatic Implantable Cardioverter-Defibrillator: Update 1990** . . . . . 463  
*Enrico P. Veltri MD, Diana Aarons RN and Juan Juanteguy MD*  
The automatic implantable cardioverter-defibrillator (AICD) has become the landmark breakthrough in therapy for patients at high risk for sudden cardiac death.
- Calcitonin and the Treatment of Osteoporosis** . . . . . 469  
*Christine R. Schneyer MD*  
Calcitonin, a potent inhibitor of bone resorption, is an important agent for the treatment of osteoporosis. An analgesic effect of salmon calcitonin has also been reported. The recent development of calcitonin nasal spray should eliminate the need for injections.
- The Efficacy of Amiodarone in the Treatment of Refractory Nonsustained Ventricular Tachycardia** . . . . . 475  
*Steven L. Ballas MD and Enrico P. Veltri MD*  
Amiodarone is very effective in suppressing refractory nonsustained ventricular tachycardia. Efficacy can be assessed after one week of therapy with continued long-term response in the vast majority of patients.
- Augmentation Rhinoplasty Utilizing Cranial Bone Grafts** . . . . . 479  
*Ira D. Papel MD*  
The cranial bone graft has proven to be a safe and effective augmentation procedure for use in reconstructive rhinoplasty.
- Thrombolytic Therapy for Acute Myocardial Infarction in the 1990s** . . . . . 485  
*Mark B. Effron MD and Ralph E. Morales MD*  
The efficacy of intravenous thrombolytic agents in preserving left ventricular function and in decreasing mortality from an acute myocardial infarction was demonstrated in the 1980s. The 1990s will concentrate on adjunctive therapy to thrombolysis in the treatment of an acute myocardial infarction.
- Glaucoma Treatment and the Laser Revolution** . . . . . 493  
*Irvin P. Pollack MD*  
The potential uses of laser energy are only beginning to be explored, but it is only a matter of time before we will be able to predictably alter the internal structures of the eye to better control any type of glaucoma.

## The Neurosurgical Treatment of Intracranial Aneurysms in the Community Hospital . . . . . 497

Ronald J. Cohen MD, FACS

A consecutive series of operations for thirty intracranial aneurysms in twenty-eight patients illustrates that patients with ruptured intracranial aneurysms can undergo surgery safely in an appropriately equipped community hospital.

## Stress Testing: Optimal Use of the Various Modalities of Stress Testing in the Diagnosis of Coronary Artery Disease . . . . . 501

Romulo F. Baltazar MD, FACP, FACC

Stress testing is useful in the diagnosis of coronary artery disease and in quantitating levels of fitness, evaluating rehabilitation progress, screening exercise-related arrhythmias, and evaluating medication efficacy.

## Drug Interference on Alpha-fetoprotein Assays . . . . . 513

Phillip J. Goldstein MD, Shan G. Sundaram PhD and

Saravanan Manimekalai PhD

Due to the *in vitro* effects of drugs on human alpha-fetoprotein (AFP) assays, clinicians should review a patient's medication history before interpreting a low maternal serum AFP and proceeding with more tests.

## Mexiletine-associated Left Ventricular Dysfunction: A Case Study . . . . . 519

Steven L. Ballas MD, Kenneth L. Baughman MD,

Lawrence S.C. Griffith MD and Enrico P. Veltri MD

Mexiletine is a lidocaine analogue used in the treatment of symptomatic ventricular arrhythmias. However, in selected individuals with baseline diminished left ventricular function, it may possess clinically significant negative inotropic effects.

## Proarrhythmia: Disparity of Programmed Electrical Stimulation Results and Spontaneous Occurrence: A Case Report . . . . . 521

Angel E. Alicea MD, Enrico P. Veltri MD and Diana Aarons RN

The disparity noted between programmed ventricular stimulation results and spontaneous occurrence of proarrhythmia suggests that programmed ventricular stimulation may be insensitive in identifying the risk and underlying mechanism of proarrhythmia.

# Central Laboratories

Established 1970

*Partners for Quality Healthcare*

## **First in Communication:**

Central Laboratories of Associated Maryland Pathologists, Ltd. was the first clinical reference laboratory in the region to provide telecommunication of results to clients. We now provide real time result communication to our clients—when an assay has been verified and results released, you will receive the report on your teleprinter. Patient data is maintained for up to 6 months on-line for ease of retrieval.

## **First in Service:**

Central Laboratories, a privately owned regional reference laboratory, was first in the Baltimore-Washington area to provide 24-hour, 7 day comprehensive testing services, and maintains that distinction today.

## **Continuous in Quality:**

Quality assurance begins the minute the specimen is collected and continues throughout testing and reporting. Central Laboratories offers a comprehensive and growing list of assays.

**Phone the marketing department for information on our services. We will be pleased to provide a customized proposal for your laboratory testing needs.**

# A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS<sup>™</sup> MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

ACCESSIBLE MRI of  
BALTIMORE COUNTY, INC.

Suite 212  
Towson, MD 21204  
**(301) 825-4MRI**

*Magnetic Resonance Imaging without claustrophobia or noise associated with other systems*

# *Catastrophic Illness is Rare and the Treatment is Critical.*

You know the patient. The one with chronic psychosis that hasn't responded to general inpatient care. The patient has comprehensive coverage so you've been able to admit him time and time again for inpatient care. But there's been little if any improvement, and you're frustrated. It's time to refer him to a hospital that is committed to treating the long term refractory patient and has the resources to do it. Sheppard Pratt.

Today's literature discourages long term hospitalization, and we agree. That same literature does, however acknowledge that a small group of chronic patients cannot be treated any other way. In 1984, Sheppard Pratt opened an 18 bed unit that treats only those types of patients.

We are not talking about custodial care nor do we treat patients who spend years talking about delusions. We provide long term, active, behavioral, psychopharmacological treatment for those patients who can genuinely be helped.

In addition to managing systematic and aggressive medication trials, our patients live within an established token economy. Patient education and social skills programming, and specialized activity therapy are provided daily throughout treatment. Formalized psychoeducation is also a vital component of treatment and family involvement. Comprehensive discharge planning is given attention equal to inpatient care. Sheppard Pratt provides many options for aftercare including a quarterway house, supervised housing, vocational training, outpatient therapy and medications management, and day hospitals.

Sheppard Pratt is a comprehensive network of psychiatric services. In addition to our 322 bed hospital we maintain the 16 bed Mt. Airy House, numerous community outreach programs and the National Center for Human Development. For more than 100 years, Sheppard Pratt has earned its reputation for providing quality care to the chronically ill patient. And during these difficult economic times, we remain loyal to that heritage.

For further information or to make a referral contact the Adult Admissions Office at:

## EPIDEMIOLOGY & DISEASE CONTROL PROGRAM

201 W. Preston Street, Baltimore, Maryland 21201 (301)225-6700

June 1991

### **Haemophilus influenzae, type b (Hib) Conjugate Vaccines for Prevention of Hib Disease Among Infants and Children Two Months of Age and Older**

*Within the past six months, two conjugate vaccines (Lederle-Praxis and Merck Sharp and Dohme) have been licensed for use in infants. One additional conjugate vaccine (Connaught Laboratories) is available, but is only licensed for use in children 15 months of age or older. The following recommendations from the Immunization Practices Advisory Committee (ACIP) are taken from the Morbidity and Mortality Weekly Report, Recommendations and Reports. 1991; 40, No. RR-1:1-7.*

#### **Recommendations for Hib Vaccine Use**

**1. On the basis of the above considerations, the ACIP recommends that all children receive one of the conjugate vaccines licensed for infant use (HbOC or PRP-OMP)<sup>1</sup>, beginning routinely at 2 months of age (Table 1).**

Administration of the vaccine series may be initiated as early as age 6 weeks.

**2. If HbOC is to be used, previously unvaccinated infants 2-6 months of age should receive three doses given at least 2 months apart.** Unvaccinated infants 7-11 months of age should receive two doses of HbOC, given at least 2 months apart, before they are 15 months old (Table 2). Unvaccinated children 12-14 months of age should receive a single dose of vaccine before they are 15 months of age. An additional dose of HbOC should be given to all children at 15 months of age, or as soon as possible thereafter, at an interval not less than 2 months after the previous

dose. The other two conjugate vaccines licensed for use at 15 months of age may be used for this dose, but there are no data demonstrating that a booster response will occur. An interval as short as 1 month between doses is acceptable but not optimal.

**3. If PRP-OMP is to be used, previously unvaccinated infants 2-6 months of age should receive two doses 2 months apart and a booster dose at 12 months of age.** Children 7-11 months of age not previously vaccinated should receive two doses 2 months apart and a booster dose at 15 months of age (or as soon as possible thereafter), not less than 2 months after the previous dose. Children 12-14 months of age not previously vaccinated should receive a single dose and a booster dose at 15 months of age (or as soon as possible thereafter), not less than 2 months after the previous dose. The other two conjugate vaccines licensed for use at 15 months of age may be used for this dose, but there are no data demonstrating that a booster response will occur. An interval as short as 1 month between doses is acceptable but not optimal.

**4. Unvaccinated children 15-59 months of age may be given any one of the three conjugate vaccines licensed for this age group.**

**5. Ideally, the same conjugate vaccine should be used throughout the entire vaccination series (according to the schedule outlined in Table 1).** No data exist regarding the interchangeability of different conjugate vaccines with respect to safety, im-

<sup>1</sup> *Haemophilus b Conjugate Vaccine (Diphtheria CRM 197 Protein Conjugate) (HbOC), manufactured by Praxis Biologics, Inc., and Haemophilus b Conjugate Vaccine (Meningococcal Protein Conjugate) (PRP-OMP), manufactured by Merck Sharp and Dohme, newly licensed for use with infants.*

munogenicity, or efficacy. However, situations will arise in which the vaccine provider does not know which type of Hib conjugate vaccine the child to be vaccinated had previously received. Under these circumstances, it is prudent for vaccine providers to ensure that at a minimum an infant 2-6 months of age receives a primary series of three doses of conjugate vaccine. These recommendations may change as data become available regarding the response to different conjugate vaccines in a primary series.

**6. Children <24 months of age who have had invasive Hib disease should still receive vaccine, since many children of that age fail to develop adequate immunity following natural disease.** The vaccine series can be initiated (or continued) at the time of hospital discharge.

**7. Chemoprophylaxis of household or day-care classroom contacts of children with Hib disease should be directed at both vaccinated and unvaccinated contacts because immune individuals may asymptotically carry and transmit the organism.** Because of the time required to generate an immunologic response, vaccination following exposure should not be used to prevent secondary cases. However, the ACIP strongly supports extensive use of the Hib vaccine for infants attending day-care facilities; that action

should substantially decrease the occurrence of primary cases of Hib disease in day-care facilities. If every child in a household or day-care classroom has been fully vaccinated, chemoprophylaxis is unnecessary.

**8. Conjugate vaccine may be given simultaneously with diphtheria and tetanus toxoids and pertussis vaccine adsorbed (DTP); combined measles, mumps, rubella vaccine (MMR); oral poliovirus vaccine (OPV); inactivated poliovirus vaccine (IPV).** Any of the vaccines may be injected in the thigh, and two injections may be given in the same deltoid. All licensed conjugate vaccines should be administered by the intramuscular route. There are no known contraindications to simultaneous administration of any Hib conjugate vaccine with either pneumococcal or meningococcal vaccine.

**9.** No efficacy data are available on which to base a recommendation concerning use of the vaccine for older children and adults with the chronic conditions associated with an increased risk of Hib disease. Studies suggest, however, good immunogenicity in patients with sickle cell disease, leukemia patients who have had splenectomies or who have HIV infection, and administering vaccine to these patients is not contraindicated.

**See next two pages for Hib consent form<sup>2</sup>.**

**TABLE 1. ACIP-recommended *Haemophilus influenzae* type b (Hib) routine vaccination schedule**

Vaccine	2 months	4 months	6 months	12 months	15 months
HbOC	dose 1	dose 2	dose 3		booster
PRP-OMP	dose 1	dose 2		booster	

**TABLE 2. Detailed vaccination schedule for *Haemophilus b* conjugate vaccines**

Vaccine	Age at 1st dose (months)	Primary series	Booster
HbOC (Lederle-Praxis)	2-6	3 doses, 2 mo. apart	15 mo.*
	7-11	2 doses, 2 mo. apart	15 mo.*
	12-14	1 dose	15 mo.*
	15-59	1 dose	—
PRP-OMP (Merck Sharp and Dohme)	2-6	2 doses, 2 mo. apart	12 mo.*
	7-11	2 doses, 2 mo. apart	15 mo.*
	12-14	1 dose	15 mo.*
	15-59	1 dose	—
PRP-D (Connaught)	15-59	1 dose	—

\*At least 2 months after previous dose.

<sup>2</sup> **Important information about Hib disease** (see next two pages) is the "official" Centers for Disease Control statement and consent form for Hib vaccine use. Please reproduce for your office use or contact the Immunization Division, DHMH, for an additional copy for reproduction (301) 225-6679.

# **IMPORTANT INFORMATION ABOUT HAEMOPHILUS INFLUENZAE TYPE b DISEASE AND HAEMOPHILUS b CONJUGATE VACCINE**

***Please read this carefully***

**HAEMOPHILUS b  
Conjugate 10/19/90**

## **WHAT IS HAEMOPHILUS INFLUENZAE TYPE b DISEASE?**

*Haemophilus influenzae* type b (*Haemophilus b*) is a bacterium which can cause serious disease, especially in children under 5 years of age. This bacterium is not the cause of the "flu" (influenza). In the United States, *Haemophilus b* causes about 12,000 cases of meningitis (infection of the covering of the brain) each year, mostly in children under 5 years of age. About 1 child in every 20 with meningitis caused by *Haemophilus b* dies of it and about 1 out of 4 has permanent brain damage. *Haemophilus b* can also cause pneumonia and infections of other body systems such as blood, joints, bone, soft tissue under the skin, throat, and the covering of the heart.

About 1 in every 200 children in the United States will have a moderate to severe disease caused by *Haemophilus b* before their fifth birthday. Serious *Haemophilus b* disease is most common in children between 6 months and 1 year of age.

About half of all *Haemophilus b* disease in children happens during the first year of life. The disease still occurs with some frequency in older preschool children. Thirty percent of severe disease occurs in children 18 months of age or older.

## **HAEMOPHILUS b CONJUGATE VACCINE:**

There are at least three types of licensed *Haemophilus b* conjugate vaccines available for use. All of the vaccines contain the outer coating of the *Haemophilus b* bacterium which is the part that gives protection against the disease. All of the vaccines are approved for use in children 15 months of age and older.

There are some differences among the vaccines. However, all of the vaccines are considered to be effective. Not all of the vaccines are approved for use in infants. The *Haemophilus b* conjugate vaccine is given by injection. More than 90 percent of infants respond to 3 doses of the vaccine approved for infants by making substances in their blood (antibodies) that provide long-term protection against the severe diseases caused by *Haemophilus b* bacteria. However, several days are required for any protection to be obtained after immunization. Whether the vaccine provides protection against ear infections caused by *Haemophilus b* bacteria is not known. It does not protect against disease caused by other types of *Haemophilus*. The vaccine does not protect against meningitis caused by other bacteria. The vaccine is not known to cause *Haemophilus* disease. The *Haemophilus b* conjugate vaccine first became available in 1988 and its use for infants first became recommended in 1990.

***(PLEASE READ OTHER SIDE)***

## WHO SHOULD RECEIVE THE HAEMOPHILUS b CONJUGATE VACCINE?

1. All children should receive the vaccine approved for infants at 2, 4, and 6 months of age. Also, a dose of any of the approved Haemophilus b conjugate vaccines should be given at 15 months of age, or as soon as possible thereafter.
2. Unvaccinated children 15-59 months of age should receive a single dose of conjugate vaccine.
3. Children 60 months of age and older and adults normally do not need to be immunized.

## POSSIBLE SIDE EFFECTS FROM THE VACCINE:

The Haemophilus b conjugate vaccine has few side effects. Information about the vaccine now available in the United States indicates that about 2 out of every 100 infants who receive the vaccine may have a fever higher than 101°F; 2 out of every 100 may have redness in the area where the vaccine was given; and 1 out of every 100 may have swelling or warmth in the area where the vaccine was given. These reactions begin within 24 hours after the shot is given, but generally go away by 48 hours after immunization. As with any vaccine or drug, there is a rare possibility that other serious problems or even death could occur after receiving the Haemophilus b conjugate vaccine.

## WARNING - SOME PERSONS SHOULD NOT TAKE THIS VACCINE WITHOUT CHECKING WITH A DOCTOR:

- Anyone who is sick right now with something more serious than a minor illness such as a common cold.
- Anyone who has had a serious reaction to a product containing thimerosal, a mercurial antiseptic included in one of the vaccines that is in use.
- Anyone who has had an allergic reaction to a vaccine containing diphtheria toxoid so serious that it required medical treatment.

## QUESTIONS

If you have any questions about Haemophilus b disease or Haemophilus b conjugate vaccine, please ask now or call your doctor or health department before you sign this form.

## WHAT TO LOOK FOR AND DO AFTER THE VACCINATION:

As with any serious medical problem, if the person has a serious or unusual problem after getting the vaccine, call a doctor or get the person to a doctor promptly.

If the person who received the conjugate vaccine gets sick and visits a doctor, hospital, or clinic during the 4 weeks after immunization, please report it to:

## PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

*I have read or have had explained to me the information on this form about Haemophilus b conjugate vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of the Haemophilus b conjugate vaccine and request that it be given to me or to the person named below for whom I am authorized to make this request.*

## A Clinical Moment With . . . Diabetes

### Hypoglycemia May Be a Prodrome of Diabetes Mellitus

*Doctor: Because I have two sisters with diabetes mellitus, I have been participating in an annual diabetes screening program. Last year I was told that I had hypoglycemia and this year that I have diabetes. Admittedly, I am about thirty pounds overweight, but I feel fine except for an occasional episode of weakness, tremor, hunger, and sweating. Is such a change possible?*

The symptoms described have been reported by some patients for a year or more before diabetes mellitus is confirmed by glucose-tolerance testing. Hypoglycemia, although technically confirmed when the plasma glucose is 59 mg/dl or less, does not produce symptoms until it is in the range of 40 to 49 mg/dl or less. Symptoms occur three to five hours after a meal, are usually mild to moderate in severity, and disappear without treatment. In the absence of disease, there is usually a rebound to euglycemia within fifteen to thirty minutes.

To confirm a diagnosis of postprandial hypoglycemia, the patient should be properly prepared and a five-hour glucose-tolerance test carried out with hourly or half-hourly testing, plus statim testing when

symptoms occur. Unless one suspects organic or iatrogenic hypoglycemia, C-peptide and serum insulin studies are an unnecessary expense.

Hypoglycemia has been described by O.P. Allen MD as part of the "Prodromal Stage" preceding the onset of diabetes mellitus. The modus operandi of this type of hypoglycemia is unknown. It may be that an early defect in diabetes mellitus consists of a diminution in the speed of mobilization of insulin in response to the stimulus of a rising blood glucose level; the capacity to produce insulin remains almost normal and the initial hyperglycemia resulting from the lag in insulin secretion finally causes a supernormal stimulus to the islets of Langerhans. The latter then discharge an amount of insulin sufficient to produce a transient hypoglycemia. As damage to the secretory capacity of the islets progresses, the hypoglycemic element of early diabetes disappears.

All patients with postprandial hypoglycemic symptoms and a family history of diabetes mellitus should be followed regularly for the possible development of the disease.

# Our Pictures Are Worth A Thousand Words.™

## Case #15

A 41 year old male suffered a hyper-extension injury to his left knee playing softball.  
**DIAGNOSIS: Medial collateral ligament tear. Bone bruise and fracture of the lateral tibial plateau. Posterior cruciate ligament tear.**

The plain X-ray (A) was interpreted as normal. A coronal MRI image (B) reveals a tear of the medial collateral ligament (arrows) and extensive proximal tibial bone bruise (marrow edema and hemorrhage) with a linear fracture (open arrow). A sagittal MRI image (C) demonstrates a posterior cruciate ligament tear (arrowhead). Plain radiographs are insensitive to soft tissue injury and even significant bone trauma may remain radiographically occult. The recognition of bone bruises is clinically vital as without proper treatment, osseous healing may become impaired. MRI provides an extremely comprehensive evaluation of both intra- and extra-articular pathology in the acutely injured knee and accurately assesses osseous, ligamentous, and cartilaginous integrity.

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and week-end hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

**You work hard to gain your patients' trust and confidence. At Drs. Copeland, Hyman & Shackman, we'll help you keep it.**

# Executive Director's Newsletter

June 1991

---

## J. David Nagel MD, New Med Chi President

---

On May 10, 1991, J. David Nagel MD became Med Chi's 131st President. During the Annual Meeting at the University of Maryland at College Park in May, Dr. Nagel assumed the Presidency for 1991-1992, stating that his goals for his term in office include initiating a plan to help Med Chi run even more efficiently and proposing a new leadership structure for Med Chi similar to that of the AMA Board of Trustees. He characterizes himself as a man not afraid to "ask the hard questions."

---

## Thank You! To "Doctor Of The Day" Volunteers

---

This year's "Doctor of the Day" program in Annapolis met again with huge success. Volunteer physicians covered a total of fifty-seven days during the session, assisted in a variety of ills, including a broken leg, upper respiratory infections and fainting episodes, and triaged seriously ill patients to area hospitals. Thanks to all the physicians who gave so generously of their time.

---

## Physician's Practice Digest Wins Award

---

Med Chi's newest membership publication, the *Physician's Practice Digest* magazine, has earned critical acclaim by winning a special award in the Sandoz Pharmaceuticals National Competition for Excellence in Medical Journalism. Presented to Reynaldo L. Lee-Llacer MD by a Sandoz representative at the Annual Meeting, the award consists of a plaque which is now on display at Med Chi. Members should look forward to receiving future issues of *PPD* on a quarterly basis. For more information on the publication, contact Michelle Burke, Director of Communications at 301-539-0872 or 1-800-492-1056.

---

## Proposed CLIA Enforcement Procedures

---

The April 2 *Federal Register* contained proposed rules for sanctions that the Health Care Financing Administration (HCFA) may impose on laboratories that are found not to meet federal requirements.

HCFA has proposed sanctions of graduated severity for three levels of noncompliance:

1. Condition level deficiencies with immediate jeopardy.
2. Condition level deficiencies without immediate jeopardy.
3. Deficiencies below the condition level without immediate jeopardy.

Penalties can range up to \$10,000 per day per violation.

The full text of these rules has been sent to component and specialty society presidents for dissemination to their members. The cutoff date for comments to HCFA is June 3, 1991, and can be sent to:

Health Care Financing Administration  
Department of Health and Human Services  
Attention: HSQ-179-P, P.O. Box 26676  
Baltimore, MD 21207

Please send copies of all comments to Med Chi, attention Rose Matriciani RN, JD, Assistant Executive Director for Health Care Policy. Med Chi's Public Health Committee and Ad Hoc Committee of Laboratory Regulations will review all comments.

---

## *Maryland Manufacturers' Drug Rebate Program for The Maryland Medical Assistance Program*

---

The Omnibus Budget Reconciliation Act (OBRA) of 1990 requires manufacturers to sign an agreement with the Health Care Financing Administration to provide rebates to the states' Medicaid Programs. Under this rebate program, states cannot receive federal financial participation for drug products of manufacturers who did not sign a rebate agreement by March 1, 1991. However, it is the understanding of the Department of Health and Mental Hygiene that HCFA will provide federal funds for the first quarter for the drug products of manufacturers who did not sign agreements.

Therefore, effective April 1, 1991, drug products from any manufacturers who did not sign the agreement are **not** covered by the Maryland Medical Assistance Program or the Maryland Pharmacy Assistance Program.

The full list of manufacturers who have signed to date has been sent to component society presidents for distribution to their members. For a copy of this list, contact your component president or call Leone Marks, Staff Specialist, Pharmacy Services, DHMH, 301-255-1459.

---

## *Maryland Access To Care Program Update*

---

Med Chi would like to extend its appreciation to every Maryland physician who agreed to participate in the Maryland Access to Care Program. The overwhelming response by Maryland physicians verifies and reinforces Medicine's commitment to providing primary health care to the State's neediest citizens.

While Med Chi is proud of the efforts of its membership to support and promote this program, there are still five areas in which additional physicians are needed. **These five areas are: CAROLINE, DORCHESTER, WICOMICO AND THE SOUTH WEST AREA OF PRINCE GEORGE'S COUNTY AND THE GAITHERSBURG AREA.** Med Chi is asking for your help in encouraging your colleagues to participate in the counties that have shortages. We need your help NOW! Anyone needing applications for the Maryland Access to Care Program can call Med Chi at 1-800-492-1056 or 539-0872. This is an opportunity and challenge to meet the demands of our profession by providing health services to Maryland citizens.

---

## *Health Personnel*

---

Nelson J. Sabatini, Acting Director, DHMH, has designated the Maryland Health Resources Planning Commission as the agency responsible for developing the Annual Health Occupations Shortage Projections Report. The Commission will work with other boards and commissions (including the Board of Physician Quality Assurance) to develop coordinated efforts for health personnel planning.

---

## *Rural Health Care Transition Grants Program*

---

Under the Health Care Financing Administration's 1991 Rural Health Care Grants Program, eligible rural, nonprofit hospitals may receive up to \$50,000 for three years to assist them in strengthening their capabilities to provide high quality care.

Five Maryland hospitals meet the criteria for these grants: Edward W. McCready Memorial Hospital, Kent and Queen Anne's Hospital, Inc., St. Mary's Hospital (Southern Maryland), Frostburg Community Hospital, and Garrett County Memorial Hospital.

---

## *Student Loans*

---

Medical students and residents are urged to write Maryland's members of Congress and encourage them to cosponsor and vote for H.R. 1482 (the Murphy bill) and S.102 (the Cohen bill) which would allow resident physicians to defer payment on Title IV student loans while completing accredited resident training programs.

Correspondence to Representatives and Senators may be sent to the following addresses:

United States House of Representatives  
Washington, D.C. 20515

United States Senate  
Washington, D.C. 20510

A key committee with regard to this legislation is the Committee on Labor and Human Resources. Maryland Senator Barbara A. Mikulski is a member of this Committee.

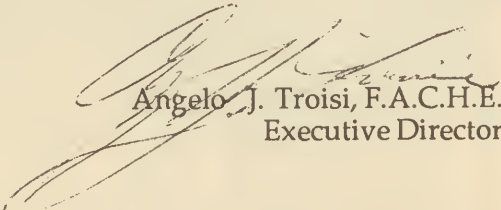

---

## *NIH Director*

---

Bernadine P. Healy MD, an Ohio cardiologist and Chief of the Cleveland Foundation's Research Institute, was confirmed by the Senate and will become the thirteenth Director of the National Institutes of Health.

Dr. Healy received her medical degree from Harvard Medical School and completed her residency in internal medicine, anatomic pathology and cardiovascular disease at The Johns Hopkins School of Medicine. She was also a Professor of Medicine at Johns Hopkins from 1976 to 1984 when she was named Deputy Director of the Office of Science and Technology Policy at the White House. Dr. Healy also served as President of the American Heart Association.

Angelo J. Troisi, F.A.C.H.E.  
Executive Director

The new center, staffed by 50 of the finest rehab physicians, therapists, nurses and clinical specialists in the area, will offer the highest quality, comprehensive inpatient and outpatient rehabilitation services.

*Maryland General-Bryn Mawr Rehab Center* features 33 inpatient rehab beds with 15 devoted

to brain injured patients and 18 designated for orthopedic and neurological rehabilitation. Outpatient services are available at the Maryland General Campus in Baltimore and at our satellite health care centers in the neighboring communities of Catonsville and Timonium.

We invite you to meet the new team in town. Call Mary Filippelli, our Administrative Director at (301) 225-8380 to get all the details and to arrange for a tour of our new facility.

*Maryland General-Bryn Mawr Rehab Center.* When it comes to rehab care, we're strictly major league.

For your insulin-mixing  
or NPH-using patients

## Humulin<sup>®</sup> 70/30 makes life easier

**Rapid onset and sustained  
duration insulin activity  
in a single vial**

- May offer enhanced control through a more physiologic activity profile
- Accurate dosing—eliminates mixing errors
- Convenient premixed dose for better compliance
- Easy to use—for patients who find mixing difficult

**Specify**  
**Humulin<sup>®</sup> 70/30**  
70% human insulin  
isophane suspension  
30% human insulin injection  
(recombinant DNA origin)

### Humulin has just the right mix

Any change of insulin should be made cautiously and only under medical supervision.

Changes in refinement, purity, strength, brand (manufacturer), type (regular, NPH, Lente<sup>®</sup>, etc), species (beef, pork, beef-pork, human), and/or method of manufacture (recombinant DNA versus animal-source insulin) may result in the need for a change in dosage.

# Talk to us. (If you talk enough the dictation equipment is free!)

- Solves staffing, space and reliability problems.
- 3600 lines a day qualifies for free equipment.
- Fast turn-around, including 3-hour STAT service.
- Printout in your office, instant revisions.

If your practice generates 3600 lines a day or more, you qualify for a complete digital dictating system without charge. Favorable arrangements are also available with smaller volumes.

Then, transcriptions are as easy as picking up your phone and dictating directly to our high-security digital recording system. Expert medical transcriptionists enter your notes into our data banks for backup, return transmission and printout. At the same

time, you'll also be building a data base for easier conversion to electronic record keeping.

Transcriptions International's electronic system is today's answer for physicians, hospitals, clinics, HMOs, group practices, rehab centers, law firms or any business needing quick, accurate and economical transcriptions.

Call today for a no obligation proposal and talk to us about your dictation needs.

**For more details, call 1-(800)-348-4326.**

## Sinai Hospital presents *Caring is Timeless:* a celebration in photographs of our 125 years.

We're celebrating our 125th year of service to the Baltimore community with a very special exhibit June 15-16 at the Baltimore Museum of Art. Please join us as we retrace our heritage with images from our past. It's photographic proof that at Sinai, caring is timeless.

# **We pay attention to every detail.**

With today's advanced medical technology, we're able to produce diagnostic images of remarkable complexity, clarity and detail. Which is why our head and body MRI imaging services are so valuable to you and your patients.

Magnetic Imaging of Baltimore's (MIB) dedicated radiologists and staff provide your patients with the care and experience you expect. We are able to schedule your patients within 24 hours of their request at our convenient location on the campus of Greater Baltimore Medical Center.

At Magnetic Imaging of Baltimore, we realize what a difference the details can make. So take a closer look. You might discover something your patients should know about.

# Sinai Hospital of Baltimore: A Healthy Influence for 125 Years

---

Jerome P. Reichmister MD

---

*Dr. Reichmister is the President of the Medical Staff of Sinai Hospital of Baltimore, Baltimore, MD.*

When the Hebrew Hospital and Asylum (later Sinai Hospital) was founded 125 years ago, its mission was to service the Jewish indigent and Jewish physicians who were denied access to training programs elsewhere. It served these purposes up through the first half of the twentieth century, and by the 1980s, Sinai Hospital had become a tertiary care hospital with research and training programs. The hospital now has regional programs in cardiology, oncology, women's health, trauma and rehabilitation medicine, and has developed innovative programs in emergency and ambulatory medicine, and in specialized pediatrics. We have responded to changing health care needs, and will continue to innovate and maintain our partnership with the entire community in providing care for the sick and helping to keep people well.

Sinai Hospital has the third largest residency training program in the State of Maryland and is a major teaching hospital affiliated with The Johns Hopkins and University of Maryland Schools of Medicine. Research at Sinai Hospital led to the first automatic implantable defibrillator, and Sinai Hospital physicians were first in Maryland to use the nephroscope to disintegrate kidney stones. In addition, the first *in vivo* implant of a shunt in a hydrocephalic twin was done by Sinai physicians.

Assuring the continuation of outstanding patient care, and supporting medical education programs and research are the foundation for Sinai Hospital's next 125 years. ■

# Congratulations Sinai Hospital for 125 years of service, celebrating challenges of the past... meeting needs of the future.

*Reprints: Barney J. Stern MD, Division of Neurology, Sinai Hospital of Baltimore, Baltimore, MD 21215.*

The young patient with a stroke represents a relatively uncommon but serious problem. Accurate diagnosis and effective management are often a challenge. Since this illness strikes a person in the prime of life, the burden on society is not only that of medical evaluation and treatment, but also the costs of rehabilitation and lost productivity.

A basic tenet of stroke care is to define the underlying pathophysiology of the patient's problem; proper management decisions flow from this information. A fundamental challenge in approaching a young stroke patient is that the cause of the stroke can be one of many disease processes. Furthermore, the cause of a young patient's stroke is often a rare disease; the diagnosis may be missed if the patient is not approached in a comprehensive and systematic fashion.<sup>1,2</sup>

The clinician can be guided by several sources of information in approaching a stroke patient fifteen to forty-four years of age. The patient's personal and family history (Table 1), the bedside examination (Table 2), and carefully selected diagnostic studies can often provide clues to the stroke's etiology. In Part I of this series,

**Table 1. Patient's History**

Historical Fact	Significance	Historical Fact	Significance
Migraine	Predisposes to ischemic stroke, especially if complicated migraine	Bruisability	Coagulopathy, Ehlers-Danlos syndrome, Henoch-Schonlein purpura, cryoglobulinemia
Trauma	Carotid or vertebral artery dissection, even with mild trauma Delayed "spat" apoplexy causing a hemorrhagic stroke Fat emboli Arterial dissection	Sickle cell disease	Large and small vessel occlusive disease, Intracerebral, epidural, and subdural hematomas and subarachnoid hemorrhage
Chiropractic manipulation		Hemoglobin SC disease	Ischemic stroke
Intravenous drug abuse	Endocarditis, HIV infection, vasculitis, paradoxical emboli, vasospasm	Polycythemia	Arterial and venous thrombosis, Von Hippel-Lindau disease Venous thrombosis
Drug use/abuse		Paroxysmal nocturnal hemoglobinuria	
heroin	Endocarditis, foreign body emboli	Sneddon's disease	Lupus anticoagulant
cocaine	Hemorrhagic and ischemic infarct	Bone marrow transplantation	Nonbacterial thrombotic endocarditis, septic endocarditis, hemorrhagic events with thrombocytopenia
sympathomimetics	Hemorrhagic events, vasculitis		
phencyclidine	Hemorrhagic events	Raynaud's phenomenon	Scleroderma, systemic lupus erythematosus
birth control pill	Arterial and venous thrombosis, subarachnoid hemorrhage, paradoxical emboli	Behcet's disease	Lupus anticoagulant, venous thrombosis
L-asparaginase	Arterial and venous thrombosis, hemorrhagic events	Chronic ear and mastoid infection	Venous thrombosis
Alcohol	Hemorrhagic and ischemic events	Congenital heart disease	Paradoxical emboli, endocarditis
Cigarette smoking	Ischemic events	Systemic lupus erythematosus	Lupus anticoagulant, "small vessel disease," non-bacterial thrombotic endocarditis
Febrile infection, especially bacterial	Ischemic infarction		
Lyme disease		Inflammatory bowel disease	Arterial and venous thrombosis
Pregnancy/postpartum	Lupus anticoagulant, neuroborreliosis Ischemic and hemorrhagic events; consider timing of stroke relative to gestational stage	Nephrotic syndrome	Arterial and venous thrombosis
Fetal wastage	Lupus anticoagulant and anticardiolipin	Sarcoidosis	Vasculopathy
HIV infection/AIDS	Ischemic infarct associated with non-bacterial thrombotic endocarditis, syphilis, lupus anticoagulant, and HIV vasculitis; hemorrhagic events	Wegener's granulomatosis	Ischemic infarction
Deep venous thrombosis	Paradoxical embolus, lupus anticoagulant, hypercoagulable conditions	Lymphomatoid granulomatosis	Ischemic infarction
Systemic cancer	Nonbacterial thrombotic endocarditis Venous thrombosis Hemorrhage into metastasis, especially melanoma and germ cell tumors Hemorrhagic events: myelogenous and lymphoblastic leukemia, acute promyelocytic leukemia with DIC Tumor emboli	Pheochromocytoma	Von Hippel-Lindau disease, neurofibromatosis
Radiation therapy	Occlusive vascular disease	Family history	
Ischemic heart disease	Premature atherosclerosis	Hyperlipidemia, early onset MI/stroke	Ischemic infarction
Peripheral vascular disease	Premature atherosclerosis	Mitral valve prolapse	Cardiogenic embolus
Peripheral arthritis	Rheumatoid arthritis, systemic lupus erythematosus	Subarachnoid hemorrhage	Cerebral aneurysm
Renal cell carcinoma	Von Hippel-Lindau disease	Tuberous sclerosis	Cardiogenic embolus, arterial dysplasia
		Neurofibromatosis	Ischemic and hemorrhagic stroke, moya moya disease, aneurysm
		Von Hippel-Lindau disease	Hemorrhagic events, especially spinal source of SAH
		Osler-Weber-Rendu disease	Paradoxical emboli, hemorrhagic events
		Familial cavernous angiomas	Hemorrhagic events
		Mitochondrial encephalopathy, lactic acidosis, and stroke (MELAS)	Ischemic stroke
		Pseudoxanthoma elasticum	Hemorrhagic events
		Ehlers-Danlos syndrome	Cerebral aneurysm, ischemic infarction

we focus on some of the more common etiologic categories leading to stroke.

### Epidemiology

Adequate incidence data for stroke in young adults in the United States are lacking. Studies from other countries suggest an incidence of eleven to twenty-four per 100,000 persons fifteen to forty-four years of age.<sup>3</sup> Although the prevalence of cerebrovascular disease among persons eighteen to forty-four years of age is only 4 percent of the prevalence at ages sixty-five to seventy-four,<sup>4</sup> the economic importance of stroke in the young is disproportionately great. Available data

suggest that there is an excess stroke risk among black Americans, which is most evident in the younger age groups. Cerebrovascular disease is more than twice as prevalent as multiple sclerosis in the eighteen to forty-four age group.<sup>4</sup>

### Causes of Stroke in the Young

Stroke syndromes can be characterized as principally being caused by either ischemic or hemorrhagic processes. In the young, hemorrhagic disease is disproportionately represented in comparison to older age groups. For example, a survey of young stroke patients found a yearly incidence rate for ischemic

**Table 2. Physical Examination**

Finding	Significance	Finding	Significance
General appearance		Eye	
tall, thin body habitus	Marfan's syndrome (aortic dissection, mitral valve prolapse) Homocystinuria	lens subluxation	Marfan's syndrome, homocystinuria
Blood pressure		retinal phlebitis	Vasculitis, ischemic infarct
hypertension	Neurofibromatosis (pheochromocytoma, renal artery stenosis) Von Hippel-Lindau disease (pheochromocytoma)	retinal angioma	Familial cavernous angiomatosis, Von Hippel-Lindau disease
arm asymmetry	Coarctation of the aorta, aortic dissection, Takayasu's disease	visual loss, optic atrophy	Neurofibromatosis
diminished leg pressure	Aortic dissection, Takayasu's disease	retinal hamartoma	Tuberous sclerosis
Fever	Endocarditis	angioid streaks	Pseudoxanthoma elasticum
Skin		corneal arcus	Hypercholesterolemia
osler nodes, splinter hemorrhages	Endocarditis	corneal opacity	Fabry's disease
needle tracks	Intravenous drug abuse, HIV infection	Lisch nodules (pigmented hamartomas)	Neurofibromatosis
cafe-au-lait spots, axillary freckles, neurofibromas	Neurofibromatosis	Pharynx	
excessive laxity	Ehlers-Danlos syndrome (mitral valve prolapse, aneurysm)	orange tonsils	Tangier disease
telangiectasia	Hereditary hemorrhagic telangiectasia (Osler-Wever-Rendu disease), scleroderma	Heart	
purpura	Henoch-Schonlein purpura, cryoglobulinemia	murmur	Endocarditis, mitral valve prolapse, ventricular septal defect, asymmetric septal hypertrophy, myxoma, hamartoma (tuberous sclerosis)
vascular nevus	Familial cavernous angiomatosis, Bannayan-Zonana syndrome	click	Mitral valve prolapse
capillary angioma	Familial cavernous angiomatosis	Vessels	
aphthous ulcers	Behcet's disease	diminished pulses	Premature atherosclerosis, coarctation of the aorta, aortic dissection, Takayasu's disease
angiokeratosis	Fabry's disease	bruit	Premature atherosclerosis, fibromuscular dysplasia, arterial dissections, homocystinuria
livedo reticularis	Sneddon's disease (lupus anticoagulant), systemic lupus erythematosus	Abdomen	
facial angiofibromas, ash leaf spot, ungual fibroma, shagreen patch	Tuberous sclerosis lentiginosis	hepatosplenomegaly	Tangier disease
blue nevi	Cardiac myxoma	polycystic kidneys	Cerebral aneurysm
xanthoma	Hyperlipidemia	Extremities	
xanthlasma	Hyperlipidemia	xanthomas	Hypercholesterolemia, pseudoxanthoma elasticum
oral and genital ulcers	Behcet's syndrome	sclerodactyly	Scleroderma
papules, atrophic lesions	Degos disease (malignant atrophic papulosis)	venous thrombosis	Hypercoagulable state
Adenopathy	HIV infection, sarcoidosis, Tangier disease	Nervous system	
		mental retardation	Hereditary disease leading to cognitive impairment and stroke (tuberous sclerosis, homocystinuria)
		deficits in multiple vascular territories	Emboli, vasculitis
		muscular dystrophy	Mitral valve prolapse
		proximal muscle weakness	Polymyositis
		neuropathy	Tangier disease, Fabry disease

infarction to be approximately 3.4 per 100,000 and for hemorrhagic processes, 5.1 per 100,000.<sup>5</sup>

A classification of nontraumatic hemorrhagic processes causing stroke includes ruptured arteriovenous malformations (AVM) (29 percent), hypertension (15 percent), ruptured aneurysms (10 percent), miscellaneous conditions (22 percent), and undetermined causes (24 percent).<sup>6</sup>

Ischemic stroke syndromes can be attributed to large-vessel extracranial or intracranial disease (atherosclerosis and other vasculopathies), small-vessel intracranial disease, cardiogenic emboli, hematologic and other systemic diseases, and undetermined causes. Because of the variability in classification schemes, it is difficult to assign percentage values to these groups. However, roughly speaking, large and small vessel disease accounts for 31 to 54 percent of patients, cardiac disease 15 to 35 percent of patients, hematologic and other systemic diseases some 15 percent of patients, and undetermined causes 4 to 45 percent of patients.

The latter group deserves careful evaluation to try to decipher the underlying problem.

### Vasculopathies

*Atherosclerosis* occurs in young people, especially if there are predisposing factors such as hyperlipidemia, radiation therapy, and homocystinuria. Ischemic stroke results from hemodynamic compromise or distal embolization from an atherosclerotic plaque.

Blunt carotid artery injury can occur in conjunction with craniocervical trauma. The carotid artery injury is often overlooked because of other more pressing injuries, and the diagnosis of *dissection* is only considered after the onset of neurologic problems. A rent in the arterial wall allows blood to dissect through the vessel wall and cause a hematoma which narrows or occludes the true lumen, resulting in distal hypoperfusion. A luminal clot can also form and embolize distally.

Neck injuries can also cause stretching and distor-

tion of the vertebral arteries resulting in dissection.<sup>7</sup> There appears to be a propensity for adolescents to have vertebral artery dissection. Intense athletic activity during which the neck is hyperextended, such as weightlifting and swimming, can traumatize the vertebral artery.

Carotid and vertebral artery dissections can also occur spontaneously. Fibromuscular dysplasia (FMD) and disorders of collagen predispose to arterial dissections. The vessel often recanalizes and many patients have a good prognosis. A dissecting aneurysm can result from the arterial injury and require surgical repair.

*Fibromuscular dysplasia*, although usually an incidental angiographic finding, has been associated with artery-to-artery embolic stroke, intracranial aneurysm and carotid-cavernous sinus fistula. FMD can involve the extracranial carotid and vertebral arteries and, occasionally, intracranial large arteries.

*Moya moya disease* is a progressive intracranial arterial occlusive process leading to telangiectasias at the base of the brain. Angiography reveals a typical blush resembling puffs of smoke (*moya moya*). The *moya moya* appearance is now thought to be a non-specific radiographic pattern characteristic of an isolated idiopathic disorder (*moya moya disease*) or associated with other conditions such as neurofibromatosis, sickle cell disease, Marfan's syndrome, and Down's syndrome.

*Cerebrovascular malformations* are a particularly common cause of nontraumatic intracranial bleeding in the young.<sup>8</sup> Cavernous malformations are easy to diagnose with magnetic resonance imaging (MRI). The familial form of cavernous malformation is as frequent as the sporadic form and is characterized by the onset of symptoms in the first two decades of life. Though seizures are the most common presenting feature, bleeding occurs in about one fifth of patients.<sup>9</sup>

Spontaneous ruptured intracranial aneurysm should always be suspected as a cause of intracranial hemorrhage. Among almost 6,000 patients with ruptured intracranial aneurysm, 1 to 1.9 percent of the patients were age nineteen years or less.<sup>10</sup> Another series found that 95 of 476 (20 percent) patients with subarachnoid hemorrhage (SAH) were ages 15 to 45 years. Conditions associated with ruptured intracranial aneurysm in the young are coarctation of the aorta, polycystic kidney disease, AVM, and Marfan's, Ehlers-Danlos and *moya moya* syndromes.

### Lipoproteins and Stroke

Approximately 25 percent of all ischemic strokes in the young are ascribed to atherosclerosis with the proportion increasing with each decade. Plasma lipid abnormalities and aberrant cellular cholesterol metabolism are presumed to contribute to accelerated atherosclerosis. However, the relationship of lipoprotein abnormalities to the development of cerebral atherosclerosis and to subsequent thromboembolic

stroke remains to be determined. Lipid analysis in stroke cases has included measurement of total serum cholesterol, triglycerides, and high-density lipoprotein cholesterol (HDL-C) performed at various intervals after stroke. Recent developments in apolipoprotein fractionalization, understanding of lipoprotein receptors, and intracellular cholesterol metabolism suggest that plasma lipid levels do not tell the whole story.<sup>11</sup>

Although elevated total serum cholesterol and low-density lipoprotein cholesterol (LDL-C) have been established as risk factors for coronary artery disease, the relationship to stroke is less clear. The Framingham Study showed a negative association of LDL-C with stroke in women. Subsequent studies have suggested a protective effect of HDL-C, with low HDL-C predictive of increased risk for stroke.<sup>11</sup> In 1989, the multiple risk factor intervention trial (MRFIT) reported on fatal stroke risk in 350,977 men without a history of heart attack or diabetes.<sup>12</sup> Elevated total serum cholesterol correlated positively with death from intracranial hemorrhage. However, the pathogenesis of ischemic stroke related to elevated lipids is presumably atherosclerotic disease of the carotid or vertebral arteries. The MRFIT data would then suggest that previous studies which lumped ischemic stroke and intracranial hemorrhages may have been misleading.

With advances in neuroradiology, diagnostic precision has increased so that study populations may now be accurately defined. The distinction between ischemic and hemorrhagic stroke is now readily made and ischemic strokes can be classified as cortical or subcortical lesions. Although both cortical and subcortical strokes can be secondary to embolization from atherosclerotic large vessel disease, subcortical strokes are more likely to be related to intracranial, hypertensive, small-vessel disease which has not been associated with lipid abnormalities. Adams reported plasma lipoprotein analysis in forty-eight patients with cortical infarctions and thirty-six patients with subcortical infarctions.<sup>13</sup> The two groups did not differ with respect to total cholesterol, triglycerides, LDL-C, very low-density lipoprotein (VLDL), or apoprotein A1 and B. Concentrations of HDL-C were higher in patients with lacunar stroke than with cortical stroke, due primarily to low HDL-C in patients with cortical stroke. Thus, lipoprotein analysis in clearly defined stroke groups may reveal specific abnormalities amenable to preventive measures.

The timing of lipoprotein analysis in relation to the onset of stroke will influence the results. In the acute phase of stroke, serum cholesterol and triglyceride levels are depressed so that abnormalities may go undetected. Lipid abnormalities are most marked at three months after an acute stroke.<sup>14</sup> At the present time, it appears prudent to recommend fasting serum lipid studies (total cholesterol, triglycerides, and HDL-C) in young patients with stroke in whom the etiology is obscure. If the profile is normal, a repeat determination twelve weeks after the event should be obtained. Young stroke patients with hyperlipidemia should be

vigorously treated according to the American Heart Association guidelines.

It appears that in young patients, the interaction of lipid abnormalities and other risk factors for atherosclerosis may be particularly important. Although not systematically studied, the young stroke patient with atherothrombotic disease tends to fit a profile of heavy cigarette smoking, diabetes mellitus, or hypertension; attention should be paid to their management along with dietary or other intervention for lipid abnormalities.

### Cardiac and Transcardiac Causes of Cerebral Infarction

The proportion of ischemic strokes attributed to cardiac embolism has ranged from 24 to 29 percent in a recent referral center series<sup>15</sup> and from 28 percent to 31 percent in population-based studies.<sup>1</sup> There is reason to believe that these estimates are conservative since these studies were performed before the widespread use of newer cardiac diagnostic techniques.

The cornerstone of the diagnosis of a cardiac or transcardiac embolic stroke is the documentation of a potential source of embolism.<sup>16</sup> The presence of such a source, however, does not necessarily imply that the cardiac lesion is the cause of the stroke.

Cardiac evaluation should begin with two-dimensional transthoracic echocardiography. If this study is normal, a more sensitive method, transesophageal echocardiography, should be performed.<sup>17</sup> These tests may reveal a cardiac finding which is associated with emboli and which will become the focus of therapy, such as a valvular vegetation, a pedunculated mural thrombus, or a left atrial mass or thrombus.

If transthoracic and transesophageal echocardiography are normal or reveal a cardiac finding only weakly associated with stroke (such as mitral valve prolapse),<sup>18</sup> the possibility of a paradoxical embolism should not be overlooked. Paradoxical embolism occurs when material originating in the venous system or right side of the heart bypasses the pulmonary capillary bed to reach the systemic circulation via a right-to-left shunt. Paradoxical embolism has been a difficult diagnosis to establish clinically. Recently, however, it has become possible to noninvasively demonstrate intracardiac shunts due to an atrial septal defect or a patent foramen ovale by means of air-contrast echocardiography. With this technique, intracardiac shunts have been documented in 40 percent of a series of ischemic stroke patients under fifty-five years of age,<sup>18</sup> compared to a rate of 10 percent<sup>18</sup> to 18 percent<sup>19</sup> in nonstroke controls. If an intracardiac shunt is present and a right-sided source of embolism can be documented, then the diagnosis of paradoxical embolism is strongly supported and appropriate therapy may be instituted. In the absence of a demonstrable right-sided source of embolism, a patent foramen ovale must be considered as only a potentially relevant factor and other causes of stroke must be vigorously

sought. If other potential causes of stroke are excluded, presumptive diagnosis of paradoxical embolism may be justified.<sup>16</sup>

The role of mitral valve prolapse in the pathogenesis of stroke is undergoing re-evaluation. While some<sup>16</sup> case-control studies suggest an increased risk of stroke in patients with mitral valve prolapse, the magnitude of this risk is estimated to be quite low, approximately 1 in 11,000 (<0.01 percent) per year.<sup>16</sup> Since mitral valve prolapse is quite common in young adults (approximately 15 percent of females and 3 percent of males), it is not appropriate to ascribe a stroke to mitral valve prolapse until other more probable etiologies have been excluded. It is possible that certain subtypes of mitral valve prolapse are more strongly linked to stroke, although the epidemiologic evidence for this is lacking.

Like mitral valve prolapse, migraine and the use of oral contraceptives, sympathomimetic agents, or illicit drugs are very prevalent among young adults. Therefore, they should be considered the cause of a stroke only after a complete evaluation has excluded other etiologies.

### Migraine and Stroke

If the mechanism of migrainous auras such as scintillating scotomata is cerebral vasoconstriction,<sup>20</sup> as has been widely presumed, then migraine is undoubtedly the most common cause of transient cerebral ischemia. Much less clear, however, is the frequency with which migraine produces ischemic cerebral infarction as a consequence of prolonged, severe vasoconstriction, perhaps complicated by thrombosis at the site of vasospasm. Thrombosis may be promoted by increased platelet aggregability in migraine.<sup>21</sup> Another hypothesis regarding the pathophysiology of migraine holds that its central nervous system (CNS) symptoms are due to transient neuronal dysfunction mediated by brainstem regulating centers. In this model, based on a phenomenon known as spreading depression of Leao, vasoconstriction is regarded as secondary to reduced neuronal metabolism and diminished demand for blood flow.

Recent studies of stroke in young people have suggested that migraine is the cause in 6 to 16 percent, but reliable ascertainment is difficult in the absence of definitive diagnostic markers for migraine.<sup>22</sup> Although it is commonly held that migrainous stroke is most likely to occur with coincident headache and in patients with prior complicated transient ischemic attack (TIA-like) migraine episodes, there is evidence that migrainous stroke can occur in patients with *common* migraine, as an initial manifestation of migraine, and without accompanying headache.<sup>22</sup> In part, this confusion relates to heretofore excessively stringent criteria for the diagnosis of migraine; there is growing belief that "tension" and migraine headache share a common pathophysiologic mechanism.

Women seem to be at higher risk for migrainous

stroke than men,<sup>22</sup> perhaps reflecting the female preponderance of migraines. However, oral contraceptives and estrogen replacement therapy can trigger migraine, perhaps accounting for some of the sex difference in migrainous stroke incidence. The possible association between oral contraceptive use and stroke in young women may be mediated through migrainous vasospasm in addition to hypercoagulability. Other factors implicated as causes of stroke in the young, such as sympathomimetic drugs and pregnancy, may similarly act by provoking migraine.

Migrainous stroke tends to occur in the posterior circulation, consistent with the usual localization of migrainous auras.<sup>21,22</sup> Abnormal computed tomography (CT) and MR scans showing predominantly posterior circulation strokes have been reported in migraine patients not only with clinically-apparent events but also without stroke histories.<sup>21</sup> These data suggest that migrainous strokes can occur subclinically and are even more common than published studies of young stroke patients indicate. Cerebral angiography can usually be safely performed and may be normal or may show irregularity or occlusion of large or small intracranial vessels.<sup>22</sup> As already mentioned, migrainous stroke is a diagnosis of exclusion that should not be made until thorough evaluation has eliminated other stroke causes.

Patients with migrainous stroke tend to have favorable outcomes and a low recurrence rate.<sup>21,22</sup> The possibility of recurrence can be minimized by appropriate prophylactic measures. Treatment begins with avoidance of migraine trigger factors such as chocolate, caffeine, tyramine-containing and nitrite-processed foods, oral contraceptives, estrogen replacement therapy, and decongestant medications. Useful migraine-preventive medications include calcium antagonists such as verapamil, beta blockers such as nadolol and propranolol, and tricyclic antidepressants such as nortriptyline. Low dose aspirin may be a prudent addition.

### Oral Contraceptives and Stroke

Epidemiologic studies employing both case-control and cohort methodologies have implicated oral contraceptive use as a risk factor for ischemic stroke and, less consistently, SAH.<sup>23</sup> Studies have found the risk of oral contraceptive use was increased among smokers; this may be particularly true for SAH.

The available data on oral contraception and stroke risk suffer from a number of limitations. First and foremost, no studies have been published addressing the stroke risk of the currently used low dose estrogen preparations (less than 50 micrograms). Second, little attention has been paid to the progestogen component of oral contraceptives as a possible contributor to cardiovascular risk. Third, it is not known whether migraine, even complicated migraine, increases the stroke risk of oral contraceptive users. Nevertheless, pending further studies, it would be prudent to not use

oral contraceptives in patients who have classic or complicated migraine, in patients who have had a transient ischemic attack or stroke, or in patients who smoke, have hypertension or have other predisposing factors for stroke.

### Drug Use and Abuse

Use and misuse of a variety of drugs are increasingly recognized as contributing to ischemic and hemorrhagic stroke in young adults. The list of drugs includes heroin, cocaine (especially "crack"), amphetamines (dextroamphetamine and methamphetamine), over-the-counter sympathomimetics (phenylpropanolamine, ephedrine, pseudoephedrine), "T's and Blues," lysergic acid diethylamide (LSD), phencyclidine (PCP), and alcohol (Table 3).<sup>24-27</sup>

Of the reported cases of stroke, the age range is perinatal to sixty-three years, with most cases occurring in the third and fourth decades. Symptoms frequently occur immediately or within hours after intravenous, intramuscular, oral, inhalational or intra-arterial administration of the offending agent, but may be delayed as long as two to three weeks after exposure. Symptoms can occur upon first exposure or after re-exposure to the agent following prolonged abstinence. The types of cerebrovascular events that occur include TIAs, anterior and posterior circulation ischemic stroke (in both large and small vessel territories), parenchymatous hemorrhage, SAH, and intraventricular hemorrhage.<sup>24-26</sup>

Multiple mechanisms may account for strokes related to drug use. Ischemic strokes can be due to embolization of administered foreign material, vasospasm, vasculitis and other immunologic mechanisms, enhanced platelet aggregation and thromboxane beta-2 production, decreased fibrinolytic activity, and cardiac dysfunction or arrhythmias.<sup>24,26</sup> Subarachnoid and intracerebral hemorrhage can result from unmasking pre-existing lesions, such as aneurysms, AVMs, and tumors by hypertensive responses to offending agents, particularly cocaine. Hemorrhage may also be caused by transient hypertension and sud-

den excessive perfusion into a normal vascular bed which cannot compensate for the increased pressure head (breakthrough perfusion). Other mechanisms leading to hemorrhage include vasculitis and other immunologic phenomena, enhanced plasminogen activator activity, and induction of microaneurysms with subsequent rupture. Of importance is the fact that patients may be normotensive or have rapidly resolving hypertension when first seen.<sup>24-26</sup> It may be difficult to define the stroke mechanism and causative agent in individual cases because patients frequently abuse multiple drugs, often of unknown composition, and synergism between the pharmacologic and pathophysiologic actions of multiple drugs may occur.<sup>24</sup>

Limited data exist to suggest the role or risk of stroke associated with drug use or abuse. Of concern is the apparent increase in reported cases of stroke associated with cocaine use. In one study at an urban university hospital, the proportion of stroke cases historically associated with drug use/abuse was conservatively estimated to be 10 to 15 percent.<sup>27</sup> In only a small number of case reports has there been mention of stroke risk factors.<sup>26</sup> From an epidemiologic perspective, it is still unknown to what extent drug(s) may be implicated in the causation of symptoms in patients with or without pre-existing stroke risk factors or vascular or other lesions. It is unclear whether drug use/abuse is an independent risk factor for cerebral ischemia or hemorrhage or whether it merely potentiates or unmasks pre-existing vascular disease. The relative risk of ischemic stroke associated with alcohol consumption may only be increased at levels of three or more drinks daily. For hemorrhagic stroke, especially SAH, there appears to be a positive linear pattern of increasing risk at all levels of alcohol consumption.<sup>25</sup>

The patient, as well as the patient's family and friends, should be questioned about recent drug use. Needle marks and otherwise unexplained cardiac arrhythmias, tachycardia, and hypertension may suggest drug use. Samples of blood and urine should be obtained and screened for all potential agents as soon as possible; in some cases, repeated urine screens may be necessary. A number of methods have been developed for the laboratory evaluation of drug abuse.<sup>28</sup> Chromatographic methods include thin layer chromatography, gas liquid chromatography, high pressure liquid chromatography, and combined gas chromatography-mass spectroscopy in order of increasing specificity and cost. Competitive binding techniques include radioimmunoassay and enzyme multiplied immunoassay. In order to screen for all potential drugs, a battery of tests is frequently useful. After appropriate neurodiagnostic evaluation, treatment should be individualized and include measures to enhance drug elimination, when feasible.

### Hypercoagulability

Hypercoagulability, or the tendency for circulating blood to spontaneously initiate endogenous thrombus

formation, is a potential cause for stroke in the young patient.<sup>29</sup> This problem can lead directly to *in situ* thrombus formation in vessels associated with the CNS or give rise to emboli that lodge in these vessels.

A hypercoagulable state may be defined as a biochemical aberration of the blood or its contact surfaces that facilitates thrombus formation. In-depth understanding of the phenomenon is nearly completely lacking. It is not known what initiates an imbalance in the hemostatic mechanism. Recognition of the substance(s) responsible for the inciting event is particularly difficult because of the evanescence of the situation. In addition, these events occur directly in or on the edge of a rapidly moving stream of blood that is sizeable in volume. Opportunities to isolate this substance(s) are unlikely and nearly unthinkable at our present state of knowledge. Nonetheless, the existence of such a state is unquestioned and considerable thought has been given to this problem.<sup>30-32</sup>

The primary hypercoagulable states include an absence or dysfunction of substances normally present in the circulating blood that naturally modulate the hemostatic mechanism and prevent thrombus formation (Table 4). Abnormalities of these blood components usually present in the early years of life. Often, but not always, these disorders are familial in transmission.<sup>33</sup> Frequently, there is a history of recurrent thrombotic events. These events may occur in either the venous or arterial side of the circulation. Detection and quantification of these glycoproteins requires a specialized and sophisticated laboratory. It is important that blood determinations be performed at a time when the patient is in a nonstressed (physiological or emotional) steady state. Serial determinations are often necessary. When an abnormality is identified, family studies should be pursued.

The secondary hypercoagulable states are a group of disease entities or drugs having a high frequency of associated endogenous thrombosis (Table 4). Thrombus formation in this situation is a direct result of the underlying illness or medication. In these situations, when the illness or medications are removed, the problem of thrombosis disappears. Thrombosis associated with the various disorders in this group of secondary hypercoagulable states may occur anywhere in the body including the CNS, on either the venous or arterial side of the circulatory system. One exception to this somewhat generalized statement is paroxysmal nocturnal hemoglobinuria (PNH). In PNH, the thrombotic disease is limited to venous thrombosis in the abdomen, followed in frequency by thrombosis of the cerebral veins.

There are several conditions in which disordered platelets result in thrombus formation (Table 4). At the present time, it is understood that the thrombotic problems in these patients result from dysfunction of the platelets. Thrombosis observed in this group is not secondary to increased numbers of platelets. In all these disorders, thrombosis is seen in both arteries and veins. The mechanism whereby thrombosis takes place in those patients who experience thrombocytopenia

during heparin administration is not known. However, when thrombosis occurs in this setting, it is almost exclusively on the arterial side of the circulation.

There are several disease states where the target organ damaged is the blood vessel (Table 4). When the endothelium of the blood vessel is damaged or removed, thereby exposing subendothelial collagen, thrombosis is very common. Whenever vascular endothelium is distorted, there is prompt and uniform initiation of thrombus formation. This is readily demonstrated with normal and diseased blood vessels. Precisely how endothelial damage initiates thrombus formation remains obscure. Whether endothelial cells of vessels associated with the CNS are the same as vascular endothelial cells in other anatomical areas is in need of investigation.

The presence of a hypercoagulable state should be suspected clinically when a patient in the first three decades of life<sup>33</sup> presents with a thrombotic problem and has a history of recurrent thrombotic events. Suspicion should be raised further if there is no obvious

cause, the family history for such events is positive, and the thrombosis is in an unusual anatomic site such as the upper extremities, the neck, or the CNS. Presentation of simultaneous bilateral lower extremity thrombosis, or thrombosis despite therapeutic anticoagulation, should raise great concern about the presence of a hypercoagulable state. When any of these events occur, laboratory studies should be performed and consultation with a coagulation specialist obtained.

## Antiphospholipid and Stroke

The lupus anticoagulants (LAs) comprise a heterogeneous family of acquired antibodies (IgG, IgM, or mixed) which interfere with *in vitro* phospholipid-dependent coagulation reactions by inhibiting activation of prothrombin activator complex (factors V, Xa, calcium, and phospholipid). They frequently cause a prolonged activated partial thromboplastin time (aPTT) but *in vivo*, produce an increased tendency for systemic and cerebrovascular thrombotic events. Antiphospholipid (aPL), which includes LAs and closely related cross-reacting anticardiolipin (aCL), may produce a prothrombotic state by altering hemostatic function. Disturbances in endothelial function and platelet aggregation, altered prostacyclin synthesis, reduced levels of coagulation factors, and depressed fibrinolysis have all been reported in association with aPL. It is possible these mechanisms may be involved in producing cerebral ischemia and that they may differ among affected individuals.<sup>34-36</sup>

LAs have been most frequently associated with systemic lupus erythematosus (SLE) but have also been observed with phenothiazine, procainamide and phenytoin use, other autoimmune disease, the puerperium, stroke during pregnancy, spontaneous abortions, thrombocytopenia, AIDS, Lyme disease, Behcet's syndrome, and Sneddon's syndrome (livedo reticularis and cerebral ischemic events). On rare occasion, a familial occurrence of premature stroke has been reported.<sup>34,35</sup>

Approximately one third of patients with LAs, aCL, and cerebral ischemia have SLE, often associated with thrombocytopenia. Patients with LAs in the absence of SLE frequently have alternative explanations for their cerebral ischemia. Over 50 percent have definite and 20 percent have possible or probable stroke risk factors. This suggests the possibility of synergism between the LAs and aCL, and coexisting vascular disease.<sup>36</sup>

LAs of the IgG class appear more likely to occur in clinical thrombotic states, such as stroke, but this finding is controversial. Patients with markedly elevated levels may be at greatest risk.<sup>37</sup> Some studies suggest that patients with drug-induced LAs are also at high risk, while others do not.<sup>38</sup>

Limited data exist on the prevalence of aPL in young stroke patients. Among SLE patients seen at specialized clinics for evaluation of arterial or venous occlusive disease, the rate of positive LAs or aCL averages 68 percent and 64 percent, respectively. In

**Table 4. Hypercoagulability**

Malignancy - Trousseau's syndrome
Pregnancy - postpartum
Oral contraceptives
Prothrombin - complex concentrates
Nephrotic syndrome
Leukemia
Cushing syndrome
Estrogen therapy
Disseminated intravascular coagulation
Myeloproliferative diseases
Ulcerative colitis
Paroxysmal nocturnal hemoglobinuria
Abnormalities of platelets
Myeloproliferative disorders
Hyperlipidemia
Diabetes mellitus
Heparin-associated thrombocytopenia
Abnormal blood vessels and blood rheology
Venous stasis - vessel compression, immobilization, paraplegia, obesity, postoperative state
Artificial prosthetic surfaces
Vasculitis
Chronic occlusive arterial disease
Homocystinuria
Behcet's syndrome
Hyperviscosity - polycythemia, sickle cell anemia, leukoagglutination, dysglobulinemias
Thrombotic thrombocytopenic purpura

patients with non-SLE disorders and histories of thromboembolic events, the rate of positive LAs or aCL appears to be substantially less. However, the prevalence of LAs in unselected patients with thrombotic disease is low (<2 percent). One report of an unselected group of young stroke victims found that the prevalence of LAs was 4 percent. Results of a recent controlled study suggest a significant relationship (45.6 percent prevalence) between LAs and aCL, and cerebral infarction in young adults.<sup>34</sup>

A number of vascular syndromes have been described: amaurosis fugax, transient ischemic attacks, single or multiple strokes, retinal vein occlusion, retinal artery occlusion, and cortical vein thrombosis. Ischemia and infarction in both large and small vessel territories have been described, as well as precipitation of migraine-associated infarction. Patients may suffer a stroke as the initial manifestation of the LAs. Several patients have had multiple cerebral infarctions occurring over short to long time periods. In rare instances, patients may develop steplike or gradually progressive dementia associated with multiple cerebral infarctions or cerebral atrophy.<sup>35</sup>

Diagnostic evaluation has yielded variable results. Cerebral angiography has been normal or has shown large artery stenosis or occlusion.<sup>35</sup> Some patients may have potentially emboligenic mitral or aortic valve lesions similar to nonbacterial thrombotic endocarditis demonstrable by echocardiogram.<sup>35</sup> Pathological studies are limited, but suggest that vasculitis and atherosclerosis may not be of pathogenetic importance in individual cases.<sup>35</sup>

A number of tests with varying degrees of accuracy are available to detect the presence of the antibodies.<sup>37</sup> The most readily available tests include the VDRL serologic test for syphilis (cardiolipin is in the assay) and the aCL antibody test using either an enzyme-linked immunosorbent assay or a radioimmunoassay (RIA). The VDRL is positive in only 25 percent of patients and is too insensitive to be used as a screening test. Highly sensitive coagulation assays, such as the Russell viper venom time, kaolin clotting time, and the dilute-activated PTT require special hematologic expertise. Recommended criteria for diagnosis have recently been published.<sup>35</sup>

Optimal therapy for patients with aPL has not been defined. In one study, 13 percent of patients with cerebral infarction suffered recurrent stroke during a mean follow-up of approximately one year.<sup>35</sup> Chronic anticoagulation has been used and is not associated with an increased risk of bleeding complications. Some patients may respond to antiplatelet agents. Steroids and immunosuppressive drugs do not seem to be effective in reducing antibody titers or preventing recurrence of symptoms.<sup>34,35</sup>

### Summary

We have discussed some of the more common etiologic categories found in young patients with

stroke. Though many of the causes are rare, in the aggregate they account for many of the conditions leading to stroke. In Part II of this series (July 1991), we will explore some of the less common causes of stroke in the young and outline an approach to the patient.

# The Automatic Implantable Cardioverter-Defibrillator: Update 1990

---

Enrico P. Veltri MD, Diana Aarons RN and Juan Juanteguy MD

---

---

*The automatic implantable cardioverter-defibrillator (AICD) has become the landmark breakthrough in therapy for patients at high risk for sudden cardiac death.*

---

*From the Departments of Medicine and Surgery, Sinai Hospital of Baltimore, Baltimore, MD, where Dr. Veltri is Director, Division of Cardiology; Ms. Aarons is Clinical Research Nurse, Sudden Death Prevention Program; and Dr. Juanteguy is Director, Division of Cardiothoracic Surgery. Reprints: Enrico P. Veltri MD, Division of Cardiology, Sinai Hospital of Baltimore, 2401 West Belvedere Ave., Baltimore, MD.*

Sudden cardiac death is the leading cause of cardiac mortality, accounting for approximately 50 percent of all deaths from heart disease. In the United States alone, 400,000 such deaths occur annually.<sup>1</sup> Tragically, such episodes may occur in the prime of life and only one of five individuals suffering out-of-hospital cardiac arrest survive to hospital discharge. It has been established that the vast majority of sudden cardiac death is due to ventricular tachyarrhythmias, with approximately 20 percent of these cases due to identifiable etiology such as acute myocardial infarction.<sup>2,3</sup> Those at high risk for sudden cardiac death are survivors of out-of-hospital cardiac arrest without identifiable causes and patients with recurrent ventricular tachycardia with underlying heart disease, particularly those with remote myocardial infarction with associated poor left ventricular function or cardiomyopathy. In such patients, the automatic implantable cardioverter-defibrillator (AICD) has been the landmark breakthrough in therapy.<sup>4</sup>

## Historical Perspective

The concept of an automatic implantable device that would monitor cardiac rhythm continuously and then automatically deliver an electrical discharge across the heart following the detection of a life-threatening ventricular tachyarrhythmia was first conceived by Dr. Michel Mirowski in the late 1960s in Israel. His friend, colleague, and mentor had died from sudden cardiac death. In 1968, Dr. Mirowski immigrated to Baltimore, assuming the position of Director of the Coronary Care Unit at Sinai Hospital. With 50 percent of his time committed to this clinical research project, and assisted by Dr. Morton Mower and others, the first model of the automatic implantable defibrillator became manifest in 1969.<sup>5</sup> The device was first successfully tested in a canine model.<sup>6</sup> Following more than a decade of further testing and development, notwithstanding considerable negative criticism and lack of out-

side research funding, the first device was implanted in a human at The Johns Hopkins Hospital in 1980.<sup>7</sup> After five subsequent years of clinical testing, the refined model of the device, now known as the automatic implantable cardioverter-defibrillator or AICD, was approved by the Food and Drug Administration in 1985. Experience with this device had demonstrated a significant reduction in expected mortality due to sudden cardiac death in high-risk patients.<sup>8</sup>

The device is composed of three components: the sensing leads, the defibrillating leads, and the pulse generator. The latter is the brains of the system. It is an encased shell of titanium, hermetically sealed, weighing approximately 250 grams, and containing specifically designed lithium batteries, capacitors, and logic circuits. The sensing leads are bipolar electrodes placed either endocardially (such as routine pacemaker lead) or more commonly, epicardially. These leads are used to sense the transcardiac electrogram representing the heart rate. These leads also allow for synchronization of the shock to the R wave of the electrogram. The defibrillating leads typically are paired titanium patches (or mesh) which are placed epicardially and serve as anode-cathode pairs for the shock delivery. These leads may also be used for sensing the morphology of the transcardiac electrogram, potentially differentiating supraventricular (narrow QRS complex) from ventricular (wide QRS complex) tachyarrhythmias. Figure 1 depicts the AICD pulse generator and representative lead systems.

When the sensing algorithm criteria (heart rate alone or heart rate plus morphology) have been satisfied, the batteries charge the capacitors, and a twenty-five to thirty joule monophasic truncated exponential pulse is delivered via the patch leads to the heart. For any one continuous episode of ventricular tachyar-

rhythmia, five sequential electrical discharges can be delivered by the device to terminate the arrhythmia.

Battery longevity of the AICD is dependent upon proper maintenance (i.e., a noninvasive device checks to reform the battery capacitors and the number of shocks delivered). Current devices have an expected battery life of three years.

### Indications and Contraindications

The present criteria for implantation of the AICD include at least one previous documented episode of out-of-hospital, hypotensive, sustained ventricular tachycardia or ventricular fibrillation; the absence of an identifiable, correctable cause of sustained ventricular tachyarrhythmias (such as acute myocardial infarction, electrolyte imbalance, or drug toxicity); refractoriness to antiarrhythmic drug therapy as assessed by Holter monitoring and electrophysiologic testing; and the absence of other noncardiac medical illnesses limiting expected life span to less than six months.<sup>9</sup> In some instances, patients presenting with recurrent syncope of undocumented origin and refractory inducible sustained ventricular tachycardia have undergone AICD implantation.<sup>10</sup>

Contraindications to device implantation include incessant ventricular tachyarrhythmias, New York Heart Association Class IV heart failure, and unipolar pacemakers. In the latter group of patients, AICD implantation can be performed once the pacemaker has been converted to a bipolar configuration.

### Pre-implantation Evaluation

Cardiac diagnostic procedures need to be performed to assess underlying cardiac substrate (coronary disease, cardiomyopathy, or valvular disease), as well as to assess the cardiac impulse generation and conduction system. Such testing must include a 12-lead electrocardiogram, echocardiography or radionuclide imaging of ventricular function, exercise stress testing, Holter monitoring, coronary angiography, and electrophysiologic testing.

### Implantation Procedure

There are presently four surgical approaches for implantation of the AICD.<sup>11</sup> Patients requiring concomitant cardiac surgery (coronary bypass, aneurysmectomy, valvular replacement) undergo a median sternotomy. Patients with previous cardiac surgery, pericarditis, or enlarged hearts undergo anterior-lateral thoracotomy. Other patients may either undergo a subcostal or subxiphoidal approach per the preferences of the implanting physician.

At the time of implantation, defibrillation threshold testing is performed to assess the

**Figure 1.** Depicts the AICD pulse generator and the sensing leads (intramural sutureless) and defibrillating leads (titanium patches).

minimum energy required to convert the tachyarrhythmia. The minimum acceptable defibrillation threshold is twenty joules. Conversion testing with the AICD must be confirmed at implantation.

### Clinical Experience

From November 1982 through September 1990, 147 patients underwent AICD implantation at Sinai Hospital of Baltimore. The Table depicts the patient population. There were 112 males and thirty-five females; mean age was sixty-one years. Sixty-five percent of patients had underlying coronary artery disease and 23 percent had nonischemic cardiomyopathy. The mean left ventricular ejection fraction was moderately depressed at 36 percent. Eighty-seven patients (59 percent) had experienced one previous cardiac arrest. At baseline electrophysiologic heart catheterization, sustained ventricular tachycardia or fibrillation was induced in 107 patients (73 percent), nonsustained ventricular tachycardia (<thirty seconds duration, spontaneously terminated) in eleven patients (7 percent), and twenty-nine patients (20 percent) had no inducible ventricular tachyarrhythmias. The patients had failed a mean of three serial antiarrhythmic drug trials in an attempt to suppress inducible ventricular tachyarrhythmias.

There were no intraoperative deaths. Ten patients died in the hospital within thirty days of surgery for an

operative mortality of 6.8 percent. Five deaths were due to incessant ventricular tachyarrhythmias, three deaths were from refractory congestive heart failure, and two deaths were noncardiac. Major nonfatal complications included pneumothoraces in four patients, pericardial tamponade in three patients, and adult respiratory distress syndrome in two patients (likely secondary to concomitant amiodarone therapy).

AICD system infection occurred in nine patients. This involved the AICD pulse generator pocket in eight and the lead in one. The infections were related to pocket erosion in four (spontaneous in three, secondary to pocket hematoma following a fall in one), lead erosion in one, subsequent intestinal surgery with contamination of the AICD pocket in one, and after pulse generator replacement for end-of-battery life in two. In five patients, total AICD system explantation without reimplantation was performed.

Following a mean twenty-three day hospitalization, patients were discharged and followed  $26 \pm 21$  months ( $\pm$  standard deviation). At follow-up, ninety-eight patients were alive, and thirty-nine patients had out-of-hospital death. Cardiac deaths were from congestive heart failure in thirteen, sudden deaths in eight, incessant ventricular tachyarrhythmias in five, and myocardial infarction in two. There were eleven noncardiac deaths.

Figures 2A, 2B, and 2C depict the actuarial incidence of sudden cardiac death, cardiac death, and all cause death, respectively, in the patient population. Sudden cardiac death was 2 percent, 6 percent, and 10 percent at one, two, and three years, respectively. Cardiac death was 7 percent, 16 percent, and 26 percent at one, two, and three years, respectively. All cause death was 10 percent, 24 percent, and 35 percent at one, two, and three years, respectively.

Forty-eight patients (49 percent) discharged from the hospital had at least one out-of-hospital appropriate AICD discharge (i.e., associated with presyncope, syncope, or documented sustained ventricular tachycardia on continuous electrocardiographic monitoring). Thirty-eight patients (39 percent) had at least one asymptomatic discharge, mostly from sinus tachycardia or atrial fibrillation with ventricular response above the rate detection cutoff of the device.

**Figure 2B.** Depicts the actuarial incidence of cardiac death.

**Figure 2C.** Depicts the actuarial incidence of all cause death.

Of those patients with unmonitored asymptomatic discharges, asymptomatic sustained ventricular tachycardia or nonsustained ventricular tachycardia could not be excluded with certainty. Figures 3 and 4 depict appropriate and asymptomatic AICD discharges, respectively.

### AICD Interaction

Concomitant therapy with antiarrhythmic drugs or permanent pacemakers is often necessary in the treatment of patients with the AICD. However, adverse interaction between these modalities of treatment have been reported.<sup>12,13</sup>

Antiarrhythmic drugs interact adversely with the AICD in one of three ways. First, they may increase the energy requirement to defibrillate the heart. Second, they may slow the rate of ventricular tachycardia below the rate cutoff of the device. Third, they may change the morphologic characteristics of the ventricular tachyarrhythmias so as to alter the morphology sensing criteria from being achieved. These phe-

nomena, therefore, require the testing of the device in the presence of the prescribed antiarrhythmic drug to assure satisfactory sensing and termination of the patient's arrhythmia.

Interactions with pacemakers are based on the sensing capability of the AICD. The pacemaker artifact may be recognized as an R wave and thus, is potentially counted toward meeting the rate cutoff of the AICD, or overriding the sensing of the patient's intrinsic heart rhythm. These interactions are avoided by implanting bipolar pacemakers (decreasing the amplitude of the pacemaker artifact), implanting the pacemaker lead and the AICD sensing leads as far apart as possible (to minimize cross-talk), and testing for pacemaker-AICD interactions at implantation by pacing at maximum pacing output, with ultimate programming of the pacemaker to a minimum, safe output for capture.

### Comparison to Other Therapy

The treatment of ventricular tachyarrhythmias includes antiarrhythmic drugs, surgical ablation of substrate, and device therapy. Empiric drug therapy is not advised due to the serious consequences of tachyarrhythmic recurrence. Previous historical control studies have revealed a 30 to 45 percent recurrence of cardiac arrest in such patients.<sup>23</sup> Overall, pharmacologic therapy assessed by either noninvasive (Holter monitoring) or invasive (electrophysiologic testing) has been shown to be effective in only 20 to 50 percent of patients. Indeed, patients presenting with cardiac arrest, hemodynamically unstable sustained ventricular tachycardia, and moderate to severe left ventricular dysfunction predictably do poorly using antiarrhythmic drug therapy alone.<sup>14,15</sup> Furthermore, side effects from antiarrhythmic drugs are numerous and include aggravation of arrhythmias (proarrhythmia).

Surgical therapy includes heart transplantation (for those patients with Class IV heart failure) and electrophysiologic-map-guided endocardial resection. The latter surgical approach has a 12 percent operative mortality and approximate 20 percent arrhythmia recurrence in two years.<sup>16</sup> Notwithstanding, patients with noninducible ventricular tachycardia, or cardiomyopathy without discrete scar or aneurysm, and those with poor left ventricular function are not candidates for surgical resection of the arrhythmogenic focus or circuit.

The impressive reduction of expected

**Figure 3.** Continuous electrocardiogram of sustained pleomorphic ventricular tachycardia being terminated by the automatic implantable cardioverter-defibrillator discharge (arrow).

**Figure 4.** Continuous electrocardiogram of an asymptomatic, self-terminating run of ventricular tachycardia with an automatic implantable cardioverter-defibrillator discharge (arrow) one second after spontaneous termination.

sudden cardiac death incidence by the AICD in high-risk patients has led to its being referred to as the gold standard for cardiac arrest survivors.<sup>17,18</sup> The present authors would suggest that AICD implantation should be the therapy of first choice in patients with documented cardiac arrest, noninducible arrhythmia, and poor left ventricular function (ejection fraction < 30 percent or Class II-III heart failure); in patients with hemodynamically compromising sustained ventricular tachycardia and poor left ventricular function (as defined above) irrespective of response to electrophysiologic-guided drug therapy; in patients with sustained ventricular tachyarrhythmias and associated nonischemic cardiomyopathy; and in those patients for whom antiarrhythmic drug efficacy cannot be adequately assessed or in whom patient compliance with such therapy may be questionable.

### Future Directions

A decade has now passed since the first human implant of the AICD. Indeed, over 13,000 devices have been implanted worldwide. This device, which delivers a high energy shock to automatically terminate life-threatening ventricular tachyarrhythmias, has revolutionized therapy for patients at high risk for sudden cardiac death. As growing numbers of patients at risk are being identified (even before their first cardiac arrest) and increasing numbers of hospital centers are developing clinical arrhythmia services with electrophysiologic testing facilities, AICD implantation will become the major treatment option.

Research goals must include the early identification of patients for sudden cardiac death and the continued technological development of devices with multiple functions such as bradycardia pacing, antitachycardia pacing, low energy cardioversion, and defibrillation. Programmable features for rate cutoff, new morphology sensing, other energy wave forms, delay times and noncommitted modes for shock, noninvasive telemetry monitoring and transtelephonic interrogations, and settings for tiered approach for delivery of the electrical treatment options will be developed and tested. Of paramount importance will be the use of hemodynamic sensing functions to provide clinically appropriate therapy and the testing of nonthoracotomy implantation systems.<sup>19,20</sup> With improvements in technology and with the competitive marketplace for industry, the cost of such therapy will decrease, as will the cost per life-year saved.<sup>21</sup> It is hoped that this will allow for enhanced physician and patient acceptance, with improved quantity as well as quality of life for implantees.

The dream of one great man with a simple idea has materialized despite all of the bumps in the road.

*Calcitonin, a potent inhibitor of bone resorption, is an important agent for the treatment of osteoporosis. An analgesic effect of salmon calcitonin has also been reported. The recent development of calcitonin nasal spray should eliminate the need for injections.*

---

Osteoporosis is one of the most commonly encountered metabolic bone disorders affecting, predominantly, postmenopausal women. Characterized by excessive bone resorption, it causes biomechanical instability of the skeleton and results in an increased risk for fractures. Most frequently affected sites are the hip, spine, and distal forearm, but fractures of other bones occur as well. Osteoporosis is a major public health problem in the United States, causing more than 1.5 million fractures per year at a cost of seven to ten billion dollars in 1986.<sup>1</sup> In addition to financial considerations, there is an enormous impact from this debilitating disease on productivity, independence, and self-esteem. Because of the rapid increase in the elderly population in America, it is anticipated that the cost and personal suffering caused by osteoporosis will continue to rise.

The definitive diagnosis of osteoporosis is made by histologic examination, but the disease is frequently diagnosed clinically by the finding of low bone mass on noninvasive imaging studies. Treatment is aimed at stabilizing and increasing bone mass with the goal being the prevention of future fractures. In patients with established fractures, goals include improvement of mobility and reduction of pain.

Calcitonin is one of several treatments available for osteoporosis. This agent is a potent inhibitor of bone resorption<sup>2</sup> and has been approved by the Food and Drug Administration since 1984 for the treatment of this disease. It is an effective therapeutic agent for several other disorders characterized by excessive bone resorption (e.g., Paget's disease and hypercalcemic states, especially those secondary to malignancy). Until recently, this drug has been available only as an injectable medication, thereby limiting its widespread acceptance. The recent development of a calcitonin nasal spray, in conjunction with indications of a potent analgesic effect, should result in increased use of this agent for both prevention and treatment of osteoporosis. The purpose of this paper is to review studies evaluating the use of calcitonin in the treatment of osteoporosis and to define future research directions.

## General Properties of Calcitonin

Calcitonin was first discovered in 1962 and was so named because of its effect on lowering plasma calcium concentrations.<sup>3</sup> It is a peptide hormone of thirty-two amino acids synthesized predominantly by thyroid parafollicular or C cells; its secretion is stimulated by an increase in circulating ionized calcium. Calcitonins of slightly different structures have been isolated from many species. In humans, synthetic salmon calcitonin is often used therapeutically because of its prolonged half-life in the body compared with the human hormone.<sup>4</sup>

Despite intensive investigation, the precise physiologic role of calcitonin remains uncertain. It may function as a regulatory factor in the maintenance of skeletal homeostasis and calcium balance by inhibiting bone resorption through a direct action on osteoclasts.<sup>5</sup> It may also act through effects on the immune system, since calcitonin plasma membrane receptors have recently been identified on normal human T-lymphocytes;<sup>6</sup> this has led to the suggestion that skeletal effects of calcitonin may be mediated, at least in part, through osteotropic cytokines produced by lymphocytes. Lymphocyte receptors for both calcitriol, the active form of vitamin D,<sup>7</sup> and parathyroid hormone<sup>8</sup> have been previously identified, suggesting a role of the immune system in the control of bone metabolism.

### Calcitonin and the Development of Osteoporosis

It has been proposed that calcitonin deficiency may play an etiologic role in the development of osteoporosis. Circulating calcitonin levels are lower in women than in men, who develop osteoporosis less often. It has been suggested that the life-long relative deficiency in women might contribute to the development of this disease.<sup>2</sup> Strong evidence that calcitonin is important in maintaining skeletal integrity came from analysis of the calcitonin gene in a young man with severe osteoporosis; a simple mutation in the gene resulted in the absence of circulating calcitonin.<sup>9</sup>

Calcitonin deficiency may also be important in the pathogenesis of osteoporosis due to corticosteroid excess. Patients with Cushing's syndrome due to either endogenous production or exogenous administration of glucocorticoids have consistent reductions in plasma calcitonin concentrations.<sup>2</sup>

Not all the evidence supports an association between calcitonin deficiency and osteoporosis. In studies evaluating skeletal effects of calcitonin deficiency due to previous thyroidectomy or calcitonin excess due to medullary thyroid carcinoma, there was no significant correlation between bone mineral density and chronic abnormalities of plasma calcitonin.<sup>10</sup> Thus, an etiologic role for calcitonin deficiency in the production of osteoporosis must remain uncertain.

### Calcitonin and Treatment of Postmenopausal Osteoporosis

Several well-designed clinical trials have demon-

strated the efficacy of injectable<sup>11-14</sup> and, more recently, nasal calcitonin<sup>15,16</sup> in the treatment of established postmenopausal osteoporosis. Therapeutic responses during treatment periods of twelve to twenty-six months have ranged from simple suppression of bone loss to marked dose-dependent increments in bone mass of the vertebrae and long bones.

In one impressive example, osteoporotic women treated with daily injections of 100 IU of salmon calcitonin had mean twelve-month increments in bone mineral density of the spine and femur (as determined by dual photon absorptiometry (DPA)) of 8.5 percent and 2.5 percent, respectively.<sup>11</sup> In another study, women given 100 IU of injectable salmon calcitonin on alternate days for one year, had a mean increase in radial bone mass (measured by DPA) of thirteen percent. In both studies, control osteoporotic subjects had mean decreases in bone mineral density of about 4 percent. Nasal salmon calcitonin appears to be as effective as injectable salmon calcitonin, but because of the less efficient uptake, larger doses (e.g., 200 IU per day) are usually given.<sup>15-16</sup>

There are now indications as to the reason for such large increases in bone density in response to calcitonin administration. Civitelli and coworkers have demonstrated that the skeletal response to calcitonin is directly related to the rate of bone turnover.<sup>13</sup> Bone in postmenopausal patients with *high-turnover* osteoporosis contains abundant osteoblasts and osteoclasts, reflecting active bone formation and resorption. In contrast, patients with *low-turnover* osteoporosis have few of these cells.<sup>17</sup> High-turnover osteoporotics (about one-third of the total) exhibited a striking sensitivity to calcitonin, with a 22 percent increase in vertebral bone mass and stabilization of femoral bone mineral content (measured by DPA) during a twelve-month period (even with a low dose, 50 IU injectable salmon calcitonin, alternate day regimen). In contrast, patients with low-turnover osteoporosis showed no significant changes in spinal bone mineral density during the study and some, given the same low dose, even lost some femoral bone mass.<sup>13</sup> Biochemical markers, such as circulating osteocalcin (bone gla protein) or twenty-four-hour urinary hydroxyproline excretion, are elevated in high-turnover osteoporotics and, therefore, may be extremely useful biochemical markers in predicting a response to calcitonin.<sup>13</sup>

Finally, several controlled studies indicate that calcitonin (both injectable and nasal spray) is effective for the prevention of early postmenopausal bone loss.<sup>18-20</sup> In one example, injectable human calcitonin (even at the low dose of 50 IU per week, for two years) was as effective as estradiol in preventing vertebral bone loss.<sup>18</sup>

### Calcitonin and the Treatment of Steroid-induced Osteoporosis

Glucocorticoids cause a net negative calcium balance due to a decrease in gastrointestinal calcium absorption and an increase in urinary calcium excre-

tion; they also enhance bone resorption and decrease bone formation. Because of these effects, there is an approximate 30 to 50 percent prevalence of osteoporosis in patients receiving long-term glucocorticoid therapy, and many of these patients will experience fractures. There is a close direct relationship between glucocorticoid dose and the rate of bone loss, with a greater effect on trabecular bone than on cortical bone.<sup>21</sup>

In two studies of prednisone-treated patients with sarcoidosis, salmon calcitonin (injectable, 100 IU, alternate day, fifteen months)<sup>22</sup> or a mixed regimen (injectable, 100 IU, daily, four months, followed by nasal, 200 IU, daily, eight months) prevented vertebral bone loss.<sup>23</sup> In the first study, untreated control patients experienced a mean 14 percent bone loss in the fifteen-month period.<sup>22</sup> In osteoporotic patients with steroid-dependent chronic obstructive pulmonary disease, injectable salmon calcitonin (100 IU, alternate day, six months) resulted in a small increase in forearm bone mineral density.<sup>24</sup>

### Analgesic Effect of Calcitonin

There have been a number of indications that calcitonin is effective in producing analgesia in patients with bone-related pain due to conditions such as Paget's Disease, metastatic bone disease, and acute osteoporotic vertebral fractures. Surprisingly, the analgesic effects occurred *prior* to any improvement in biochemical parameters reflecting bone resorption and persisted despite the development of resistance to calcitonin.<sup>25</sup> In one placebo-controlled study of patients with pain secondary to osteolytic metastases, salmon calcitonin (100 IU, daily, injectable, fourteen days) significantly decreased pain, as measured by a visual analog scale; this effect was associated with an increase in circulating immunoreactive B-endorphins, suggesting that the analgesic effect was mediated through the endogenous opiate system.<sup>26,27</sup> In the same study, the analgesic effect of administered *human* calcitonin was negligible. In another placebo-controlled study of patients with acute vertebral compression fractures, nasal salmon calcitonin (200 IU per day, one month) produced significant pain relief (also measured by a visual analog scale) with a noticeable effect after only seven days.<sup>28</sup>

### Side Effects of Calcitonin

At therapeutic dosages, calcitonin is devoid of detectable toxicity. However, there are minor side effects which occur in 10 to 20 percent of patients treated with injectable calcitonin. The most prominent are gastrointestinal (usually nausea; less often mild abdominal discomfort and diarrhea) and vascular (flushing of the face, tingling of the hands). Some of the gastrointestinal side effects are due to inhibition of gastric acid production by salmon calcitonin and may be diminished by administering the agent four to five hours following the evening meal. Pain at the site of

injection may occur, and urinary frequency and an unpleasant metallic taste have been described in rare instances. Reactions usually occur with initiation of therapy, are milder with subcutaneous than intramuscular delivery, and tend to diminish or disappear with continued administration of the drug. Surprisingly, undesirable reactions are more pronounced with human than with salmon calcitonin.<sup>25</sup> These side effects are almost completely eliminated with nasal administration of the hormone, and there have been no adverse effects of the spray on the nasal mucosa or vasculature.<sup>16,20</sup>

### Resistance to Calcitonin

After osteoporotic patients have received calcitonin for eighteen to twenty-four months, there is a gradual decline in responsiveness to the hormone.<sup>12,25</sup> This effect has also been observed in patients with Paget's disease. The mechanism for calcitonin resistance is uncertain; hypotheses have included antibody-mediated inactivation of the hormone (although resistance is also observed with human calcitonin) and down-regulation of skeletal calcitonin receptors. It may be advisable to use intermittent therapy to ward off the resistance phenomenon. This mode of therapy has not been fully investigated. However, in one preliminary study of women with postmenopausal osteoporosis, 200 IU per day of nasal salmon calcitonin was administered only in years one and three of a three-year study period; this treatment completely prevented bone loss in the spine and forearm.<sup>15</sup>

### Guidelines for Treatment of Osteoporosis with Calcitonin

Calcitonin is a safe and effective agent for the treatment of osteoporosis. Salmon rather than human calcitonin should be used because it has fewer undesirable side effects and because of its possible analgesic effect in patients with acute fractures. It is indicated for prevention and treatment of osteoporosis in postmenopausal women who are not suitable candidates for estrogen therapy (e.g., women with a history of breast cancer or who are intolerant of estrogen). Since it has not been established whether estrogen therapy is beneficial in the geriatric population,<sup>29</sup> calcitonin is indicated in this group. Calcitonin is also beneficial for the treatment of steroid-induced osteoporosis and has been recommended for this purpose by the American College of Rheumatology.<sup>30</sup>

Calcitonin is particularly useful in patients with high-turnover osteoporosis. As described above, this has been shown in postmenopausal women, and it is also likely to be the case in other types of osteoporosis characterized by increased bone turnover such as that associated with hyperthyroidism. Patients with high-turnover osteoporosis may be identified by the finding of an elevated circulating osteocalcin or elevated twenty-four-hour urinary hydroxyproline.<sup>13</sup>

The effect on fracture rates in patients treated with calcitonin has not been investigated. However, the rate is likely to be significantly reduced; diphosphonates, which cause only a 2 to 3 percent annual increase in vertebral bone mass (less than that usually produced by calcitonin), have been found to cause a significant decrease in the incidence of vertebral fractures.<sup>31,32</sup>

A major drawback to calcitonin is its expense. The cost of administering fifty units per day is approximately \$140 per month. This treatment is covered by Medical Assistance as well as certain prescription plans. In patients with high-turnover osteoporosis, alternate day therapy is adequate and would lower the cost to \$70 per month. Intermittent therapy, which will probably be preferable to continuous therapy (because of the problem of resistance), will also reduce medication costs.

### Research Directions

There are several studies, ongoing and planned, on the effect of calcitonin on osteoporosis; Sinai Hospital of Baltimore is involved in some of these studies. As part of a multicenter national placebo-controlled study, the analgesic effect of injectable salmon calcitonin is being tested in patients with acute vertebral compression fractures. In another five-year study which began in early 1991, a number of centers in the United States will be enrolling over 1,000 patients with established osteoporosis to evaluate the long-term effects of nasal salmon calcitonin on reduction in fractures of the spine and hip. Another study is planned to begin in the near future on the effect of nasal calcitonin for prevention of steroid-induced osteoporosis. Cyclic administration of calcitonin is an important question in need of further investigation. Finally, there is a major effort to develop an oral formulation of calcitonin.

# The Efficacy of Amiodarone in the Treatment of Refractory Nonsustained Ventricular Tachycardia

---

Steven L. Ballas MD and Enrico P. Veltri MD

---

*Dr. Ballas completed his Internal Medicine Residency at Sinai Hospital of Baltimore and is now in private practice in Youngstown, OH. Dr. Veltri is Director, Division of Cardiology, Department of Medicine, Sinai Hospital of Baltimore, Baltimore, MD. Reprints: Enrico P. Veltri MD, Division of Cardiology, Sinai Hospital of Baltimore, Belvedere at Greenspring Ave., Baltimore, MD 21215.*

---

*Amiodarone is very effective in suppressing refractory nonsustained ventricular tachycardia. Efficacy can be assessed after one week of therapy with continued long-term response in the vast majority of patients.*

---

Amiodarone is a benzofuran derivative structurally similar to thyroxine which was originally introduced in Europe as an antian-ginal agent.<sup>1</sup> It was subsequently found to have potent antiar-rhythmic potential<sup>2,3</sup> and has undergone extensive clinical investigation in the United States as an antiarrhythmic agent leading to its approval by the Food and Drug Administration for use in life-threatening ventricular arrhythmias.<sup>4-10</sup> Although its electrophysiologic effects on impulse generation and conduction have been well-investigated,<sup>11,12</sup> the determination of its efficacy in ventricular tachyarrhythmias as assessed by programmed electrical stimulation is controversial.<sup>13-17</sup> We have previously reported the results and utility of serial Holter monitoring in the evaluation of patients with clinical sustained ventricular tachycardia treated with amiodarone.<sup>18-19</sup> However, the use of amiodarone and long-term follow-up in patients with refractory nonsustained ventricular tachycardia has not been reported. This study was designed to determine the efficacy of amiodarone in this group of patients.

## Methods

**Patient Population.** Thirty-five patients with documented non-sustained ventricular tachycardia ( $\geq$  three beats,  $<$  thirty second duration, rate  $>$  100 beats per minute (bpm)) but without a history of sustained ventricular tachyarrhythmia ( $>$  thirty seconds) or sudden cardiac death (cardiac arrest within one hour of symptoms requiring cardiopulmonary resuscitation or cardioversion, or both, from ventricular tachycardia or fibrillation) were referred to the Clinical Arrhythmia Service and subsequently treated with amiodarone. The clinical characteristics of patients are summarized in Table 1.

Underlying cardiac disease was defined by cardiac catheteriza-tion, echocardiography, and radionuclide studies. Coronary artery disease (defined by 70 percent coronary artery narrowing) was present in twenty patients (57 percent), nonischemic dilated con-

gestive cardiomyopathy (defined by diffuse left ventricular hypokinesis with ejection fraction < 50 percent) in twelve patients (34 percent), hypertrophic cardiomyopathy in one patient (3 percent), mitral valve prolapse in one patient (3 percent), and no structural heart disease in one patient (3 percent). Ejection fraction was  $36 \pm 3$  percent (mean  $\pm$  standard deviation).

The clinical presentation of ventricular tachycardia was asymptomatic (other than palpitations) in twenty-two patients, presyncope (lightheadedness accompanying the arrhythmia) in eleven patients, and syncope (transient loss of consciousness with spontaneous recovery without documented sustained arrhythmia) in two patients.

Twenty-six patients (74 percent) underwent electrophysiologic testing following discontinuation of all antiarrhythmic drugs (other than digoxin or beta-adrenergic blockers) for at least five half-lives. Twenty-one patients had inducible ventricular tachycardia (sustained ventricular tachycardia in thirteen, nonsustained ventricular tachycardia in eight) using a programmed electrical stimulation protocol previously described.<sup>14</sup>

**Previous Drug Failure.** Previous drug failure was defined as continued ventricular tachycardia ( $\geq$  three beats, rate > 100 bpm) on Holter monitoring after forty-eight hours of drug therapy at therapeutic blood levels, or intolerable side effects. Patients had failed  $3.1 \pm 1.3$  drugs; drug failures are summarized in Table 2. No patient had previously been treated with amiodarone.

**Baseline Data.** Following discontinuation of all antiarrhythmic drugs (except digoxin and beta-adrenergic blockers) for at least five half-lives, all patients had nonsustained ventricular tachycardia documented on single baseline twenty-four-hour Holter monitoring prior to beginning amiodarone therapy. Baseline evaluation also included a 12-lead electrocardiogram; a complete blood count; a serum chemistry profile including liver function tests, thyroid function tests and pulmonary function studies including diffusion capacity; and an ophthalmologic evaluation including slit-lamp examination. Patients receiving anticoagulant agents or digoxin had coagulation profiles or digoxin levels obtained with appropriate dose adjustments.

**Amiodarone Administration.** The oral loading of amiodarone was 1200 mg/day for fourteen days followed by a maintenance dose of 400 mg/day. Amiodarone was the only antiarrhythmic agent used on a long-term basis; any concomitant antiarrhythmic drugs other than digoxin or beta-adrenergic blockers were discontinued two to five days after amiodarone therapy was begun. Dosage reduction to 200-300 mg/day was instituted in those patients who developed intolerable side effects.

**Holter Monitoring.** Holter monitoring (Avionics Model 445B) was performed using dual-channel recordings. Magnetic tapes were analyzed using a Del-Mar Avionics Model 660 Dynamic Electrocardio Scanner. All tapes were analyzed by both investigators and ventricular tachycardia was defined as three or more repetitive ventricular beats at a rate greater than 100 per minute. The incidence of ventricular couplets and the frequency of single premature ventricular complexes were also quantified. Random tapes analyzed independently using a Dynamic Electrocardiovalidator<sup>R</sup> Model 686 (Del-Mar Avionics, Irvine, CA) revealed a 95 percent accuracy of our technician's scan.

All patients had baseline twenty-four-hour Holter monitoring, seventy-two-hour Holter monitoring prior to hospital discharge during the second week of amiodarone therapy (days eight through ten), and serial twenty-four-hour Holter monitoring on selected follow-up intervals.

**Follow-up.** Patients were followed in the outpatient clinic of the Sudden Death Prevention Program at two, three, six and twelve months after hospital discharge, and then every six months thereafter. At each visit, repeat baseline studies, including twenty-four-hour Holter monitoring, were performed and a history of interim symptomatic events (sudden cardiac death, syncope, or presyncope) or any adverse side effects was recorded.

**Amiodarone Efficacy.** The antiarrhythmic efficacy of amiodarone was based on total suppression of nonsustained ventricular tachycardia on serial Holter monitoring. The clinical efficacy of amiodarone was based on the absence of clinical arrhythmic events (sudden cardiac death, sustained ventricular tachycardia) through follow-up. Adequate antiarrhythmic response in regard to premature ventricular complex

and couplet suppression was 83 percent and 90 percent suppression from baseline, respectively.<sup>20,21</sup>

**Statistical Analysis.** The data are presented as mean  $\pm$  standard deviation. The significance of the differences between two groups was determined by the Student's t-test for paired or unpaired data or by the chi-square or Fisher Exact test, where appropriate.  $P = 0.05$  was accepted as the limit of significance.

## Results

**Clinical Outcome.** At twelve  $\pm$  two months follow-up (range one to fifty-two), three patients (9 percent) had died. All three deaths were cardiac (two sudden, one acute myocardial infarction). One additional patient had sustained ventricular tachycardia manifesting as syncope. Thirty-two patients (92 percent) were free of clinical arrhythmic events through follow-up.

**Holter Monitoring Outcome.** Results of baseline and serial Holter monitoring on therapy (days eight through ten, and months two, three, six and twelve) are summarized in Table 3.

During the seventy-two hours of Holter monitoring after the first week of amiodarone therapy (days eight through ten), single premature ventricular complexes decreased from  $7109 \pm 1480$  per twenty-four hours to  $2172 \pm 292$  per twenty-four hours,  $P = .006$ . Ventricular couplets were similarly suppressed from  $1108 \pm 461$  per twenty-four hours to  $25 \pm 8$  per twenty-four hours,  $P = .002$ . Premature ventricular complex and couplet suppression in individual patients was  $86 \pm 1$  percent and  $95 \pm 1$  percent, respectively. Nineteen patients (54 percent) had greater than 83 percent single premature ventricular complex suppression. A significant suppression of single premature complexes in the total population continued throughout the course of follow-up. Of note, premature ventricular complex suppression remained greater than 83 percent through follow-up in eleven of nineteen patients. Ventricular couplet suppression remained greater than 90 percent through follow-up in twenty-two of twenty-six patients.

Twenty-three patients (66 percent) had ventricular tachycardia totally suppressed on seventy-two-hour Holter monitoring after the first week of therapy. Ventricular tachycardia was present on twenty-four-hour Holter Monitoring in seven patients (26 percent) at two months, six patients (26 percent) at three

months, two patients (11 percent) at six months, and one patient (10 percent) at twelve months.

**Side Effects.** Side effects other than corneal microdeposits (hepatic, pulmonary, thyroid, neurologic, and cardiac conduction) were noted in eleven patients (31 percent). Dosage reduction was required in seven patients (20 percent) and eventual discontinuation of the drug in one patient (3 percent).

## Discussion

This study reveals that amiodarone is effective in the treatment of refractory, nonsustained ventricular tachycardia as assessed by serial Holter monitoring. Antiarrhythmic efficacy, as defined by total suppression of spontaneous nonsustained ventricular tachycardia, was found in 66 percent of patients at the second week of therapy with long-term efficacy in 74 to 90 percent of patients through a mean one-year follow-up. This extent of antiarrhythmic efficacy in this patient population concurs with our previously reported findings in patients with refractory sustained ventricular tachycardia treated with amiodarone.<sup>18,19</sup> Compared with total suppression of nonsustained ventricular tachycardia however, there was a somewhat lesser degree of concomitant premature ventricular complex suppression long-term (58 percent of patients had greater than 83 percent suppression throughout the study). There was, however, a somewhat higher degree of concomitant ventricular couplet suppression (85 percent of patients had greater than 90 percent suppression throughout the study, comparable to ventricular tachycardia suppression).

Eighty-three percent suppression of premature ventricular complexes, 90 percent suppression of ventricular couplets, and total abolition of nonsustained ventricular tachycardia from baseline ectopy on follow-up twenty-four-hour Holter monitors has been shown to significantly distinguish therapeutic responsiveness from spontaneous variability of ventricular arrhythmias and has been an accepted endpoint in most studies.<sup>20,21</sup> Notwithstanding, our patient population had a high density of baseline simple and complex ectopy (a mean of 7,000 simple premature complexes and 1,100 couplets per twenty-four-hours), thus the degree and persistence of antiarrhythmic efficacy is impressive. This efficacy was demonstrable despite a significant decrease in the maintenance dose from a mean 400 mg/day at two months to approximately 300 mg/day at twelve-month follow-up.

The 92 percent arrhythmia-free incidence within our patient population must be taken into perspective. Although our patients were felt to be at high risk for sustained ventricular tachyarrhythmias (underlying ischemic or congestive heart disease, moderate left ventricular dysfunction, and a high proportion of inducible ventricular

**Table 3. Findings of Serial Holter Monitoring**

\* Mean  $\pm$  standard deviation

tachyarrhythmia at baseline programmed electrical stimulation), all patients were treated and no placebo-control group is available. Similarly, uncontrolled studies of patients with underlying heart disease and nonsustained ventricular tachycardia treated with empiric, Holter-guided, or electrophysiologic-guided antiarrhythmic therapy have shown a 5 to 17 percent yearly incidence of sudden cardiac death.<sup>22-24</sup> Further large scale trials using randomized, placebo-controlled study designs will be necessary to address the impact of specific antiarrhythmic drug therapy on sudden cardiac death in high-risk patients.

**Limitations of Study.** Our results are for a small, select patient population referred to a tertiary arrhythmia center for refractory, potentially life-threatening, ventricular arrhythmias. Thus, this population may represent a special subset of patients with nonsustained ventricular tachycardia.

### Summary

The antiarrhythmic efficacy of amiodarone in suppressing complex ventricular arrhythmias in a drug-resistant high-risk population has been demonstrated. Further studies to assess the clinical efficacy of amiodarone are warranted.

# Augmentation Rhinoplasty Utilizing Cranial Bone Grafts

---

Ira D. Papel MD

---

*Dr. Papel is an Assistant Professor and the Director of Facial Plastic and Reconstructive Surgery in the Department of Otolaryngology-Head and Neck Surgery, The Johns Hopkins Medical Institutions, and Sinai Hospital of Baltimore. Reprints: Ira Papel MD, Suite 310, 21 Crossroads Drive, Owings Mills, MD 21117.*

---

*The cranial bone graft has proven to be a safe and effective augmentation procedure for use in reconstructive rhinoplasty.*

---

Autogenous bone grafts have been used in nasal reconstruction since at least 1889<sup>1</sup> with the use of tibial grafts. The first descriptions of calvarial bone used in facial augmentation were by Muller<sup>2</sup> and Konig<sup>3</sup> in 1890. These authors reported the use of osteocutaneous flaps. Cranial grafting materials have been harvested as chips, strips, dust, and plates.

Santoni-Rugiu<sup>4</sup> reported the use of outer table grafts with maintenance of a periosteal attachment in cranial reconstruction. Tessier<sup>5</sup> recommended harvesting full thickness cranial grafts, then splitting the graft into outer and inner table components. The donor site was then reconstructed with part of the original graft material. Tessier used free calvarial bone grafts for multiple types of facial and cranial reconstruction. Clinical experience has now proven the efficacy of cranial bone in facial grafting. Powell and Riley<sup>6</sup> reported the use of outer table, free cranial bone grafts in multiple facial locations in 1987. The outer table technique differs from Tessier's description in that the inner table of the skull is left intact.

As early as 1952, Peer<sup>7</sup> observed that membranous bone from the facial area seemed to maintain its original size and shape much longer than endochondral bone from the ilium, rib, or tibia. The first comparative study to confirm this observation was reported by Smith and Abramson<sup>8</sup> in 1974. These investigators found that cranial grafts in rabbits maintained their size, structure, and calcium content while the iliac bone lost at least 75 percent of its volume in one year. These findings were confirmed in both rabbits and monkeys by Zins and Whitaker<sup>9</sup> in 1983. The biologic factors associated with these observations are not well-known. Kuziak et al<sup>10</sup> speculated that the results may relate to earlier revascularization of membranous bone. Others have speculated on the inherent architectural differences between membranous and endochondral bone, especially with regard to stress as a necessity for maintaining architecture<sup>11</sup> in endochondral bone.

## Indications

The indications for cranial bone augmentation in reconstructive

rhinoplasty include any situation requiring augmentation beyond the scope of available autologous cartilage.

Small defects which can be repaired by available autologous septal or conchal grafts are not considered for cranial grafting.

Saddle nose deformities requiring more than 2.5 mm of augmentation over the length of the nasal dorsum are ideal candidates for cranial bone grafts. Patients with previous skull fractures or craniotomies are not considered for elective cranial grafts.

In this series of twelve reconstructive rhinoplasties, eight patients had nasal deformities secondary to trauma, three from overaggressive rhinoplasties, and one from a congenital lack of nasal dorsal height (Table). Most patients received preoperative cephalometric soft tissue analysis by computer imaging (Figure 1). Follow-up in this series ranges from three to thirty-six months, with a mean of sixteen months.

### Surgical Technique

All cranial grafting procedures to date have been performed under general endotracheal tube anesthesia. The cranial exposure has been provided by limited incisions over the graft donor site, or a coronal incision if multiple grafts are anticipated. No hair is shaved in any case. The most common donor site has been the parietal region. This area has the flattest contour on the cranium and is, therefore, most conducive to nasal grafting. Coronal and sagittal sutures should be avoided in harvesting bone grafts. The sutures will provide an unstable graft, and the dural sinus beneath may cause unnecessary blood loss. The incision is carried through the pericranium, and wide elevation over the bony cranium is accomplished with a periosteal elevator.

After the site is chosen and exposure obtained, the proposed graft outlines are drawn on the cranium using a bone marking pencil. The outer cranial bone is then removed around the proposed graft with a large cutting burr. The drilling is carried down into the diploic layer and the outer edges are beveled to provide a lesser contour defect (Figure 2). A 4 mm cutting burr on an otologic style drill is commonly used. Copious irrigation is employed to prevent overheating and devitalization of the bone. The extensive beveling also allows for placement of a right angle microsagittal saw to undercut the bony outer cranium in the soft diploic layer (Figure 3). Single or multiple grafts can be

excised in this manner. In elderly patients, the diploic layer may not be as well-formed, and the depth of drilling should be carefully monitored to prevent

Figure 1. Preoperative facial analysis via computer imaging.

cranial entry. The graft is usually easily removed, and a light layer of bone wax is applied to the exposed diploic layer. This is usually adequate for hemostasis. The periosteum is then closed over the donor site, and the scalp is closed with staples. Drains are not routinely used.

The cutting burr is used to shape the graft as necessary (Figure 4). Any remaining diploic bone is removed from the deep surface of the graft. Most nasal implants are gently tapered and thinned at the ends for contour effects. Layered grafts can be secured by intergraft wiring (Figure 5). Each layer of cranial graft will provide approximately 3.0 mm of augmentation. The graft is then placed into the nose by an incision as indicated by the specific patient's problems. An effort is made to avoid extensive undermining and to create a pocket which is midline and only slightly larger than the bone graft. I prefer entry via a marginal incision to place the graft at the greatest distance from the incision. Two patients in this series underwent open

rhinoplasty due to significant nasal tip deformities. Stay sutures are placed at the inferior and superior ends of the graft and tied externally over a bolster for fixation. Most patients also received a columellar strut for tip support using either cranial bone or septal cartilage (Figure 6). These stay sutures and a tape splint are left in place for one week. Prophylactic intravenous cefazolin is given at the beginning of surgery. Postoperative oral antistaphylococcal antibiotics are prescribed for one week.

All dressings and scalp staples are removed at one week. The patient is instructed to use nasal saline spray for one month, and lateral nasal compression exercises are demonstrated (Figures 7-10).

## Results

In this series, twelve patients received cranial bone grafts for reconstructive rhinoplasty. All surgery was performed under general anesthesia and all patients were discharged on the first postoperative day.

Complications related to the donor site were limited to one wound infection and one case of persistent pruritus in the incision line. There were no cases of dural injury or cerebrospinal fluid leak. The wound infection occurred in the first patient of the series and was attributed to the use of excess bone wax. No patient complained of significant donor site pain, hair loss, or disfigurement.

Figure 4. The bone graft is contoured as necessary.

Figure 5. Layered grafts can be secured by intergraft wires.

Figure 6. Radiograph demonstrating bone grafts in place.

**Figure 7.** Patient #1: Preoperative Lateral View

**Figure 8.** Patient #1: Postoperative Lateral View

The recipient site complications have been limited to displacement of the bone graft from the midline in three patients. There have been no cases of wound infection in the nose, or extrusion of the cranial implants. One implant has been surgically repositioned. None has been removed. Patient acceptance has been good. No patients have complained of a foreign body sensation at the graft site.

### Discussion

The ideal augmentation material for reconstructive rhinoplasty would be available in plentiful supply and cause no donor site morbidity. It would also have low potential for infection or extrusion in the event of trauma. This material should also be easy to contour to specific patient needs. At this time, we do not have the ideal implant at hand. Therefore, alternative solutions must be sought.

Surgeons have utilized many materials for reconstruction of saddle nose deformities. Synthetic materials ranging from paraffin to Silastic have been used extensively, and often with good long-term success. The danger of infection or extrusion is always present if the patient suffers trauma. Homograft materials such as irradiated cartilage and demineralized bone have enjoyed recent popularity due to ease

of use and availability. Nevertheless, patient acceptance of homografts in the Acquired Immune Deficiency Syndrome (AIDS) environment is low, in spite of proven safety. Further, there has been some experimental evidence that irradiated cartilage may undergo significant resorption over time.<sup>12</sup> Autologous materials, therefore, have become much more popular among patients and surgeons.

Traditional autologous bone grafts have included rib, iliac crest, and tibia. All of these sites are endochondral bone which has been shown to have significant resorption compared with membranous bone. Donor site morbidity is also significant and there may be pain or discomfort for many weeks after harvesting. The possibility of multiple grafts from the same site does not exist. Donor site deformity and scarring is significant for the rib and tibial grafts. Cranial bone grafts have been shown to cause only minor discomfort and minimal deformity, and multiple grafts can be harvested at one time or in future procedures.

These characteristics of membranous cranial bone grafts make them excellent material for reconstructive rhinoplasty. The only complications in this series were a minor wound infection and some displacement of the grafts. These problems have been remedied by the minimal use of bone wax and transcutaneous stay sutures at both ends of the graft placed during surgery.

Figure 9. Patient #2: Preoperative Lateral View

Figure 10. Patient #2: Postoperative Lateral View

In summary, the cranial bone graft has proven to be a safe and effective augmentation procedure for use in reconstructive rhinoplasty. The major problem with proposing this to patients has been the severe sound of the procedure, as the word *cranial* brings connotations of neurosurgery to the patient's mind. Once this barrier is crossed, patient acceptance has been good, and morbidity much lower than with other autologous bone grafts.

*The efficacy of intravenous thrombolytic agents in preserving left ventricular function and in decreasing mortality from an acute myocardial infarction was demonstrated in the 1980s. The 1990s will concentrate on adjunctive therapy to thrombolysis in the treatment of an acute myocardial infarction.*

---

In 1979, the modern thrombolytic era began when Rentrop et al<sup>1</sup> reported the first demonstration of the angiographic efficacy of intracoronary streptokinase in reperfusing an occluded coronary artery. In 1980, DeWood et al<sup>2</sup> presented angiographic evidence of a high prevalence of total coronary occlusion (86 percent) during early transmural myocardial infarction with a 22 percent spontaneous reperfusion rate. The initial Western Washington Trials<sup>3,4</sup> accelerated the modern thrombolytic era by showing a marked reduction in mortality in patients treated with intracoronary streptokinase. Since that trial, the number of investigations of thrombolytic therapy in acute myocardial infarction has mushroomed. The purpose of this paper is to review what is currently known regarding the use of thrombolytic agents in acute myocardial infarction with particular attention to comparative studies on efficacy, mortality reduction, and safety. We will also discuss the current controversies in the use of thrombolytic therapy with particular emphasis on the community hospital setting.

## Review of Trials

The Western Washington Randomized Intracoronary Streptokinase Trial<sup>3,4</sup> convincingly demonstrated a significant reduction in mortality for patients receiving intracoronary streptokinase to treat an acute myocardial infarction (MI). The group of patients treated with intracoronary streptokinase had a reperfusion rate of 68 percent, a three-month mortality of 3.7 percent, and a one-year mortality of 8.2 percent, while the control group had a 12 percent reperfusion rate, a three-month mortality of 11.2 percent, and a one-year mortality of 14.7 percent. Most importantly, patients with complete reperfusion of occluded coronary arteries following intracoronary streptokinase had a 2.5 percent mortality at one year compared to a 15 to 23 percent mortality in patients with partial or no reperfusion.

Because of the delay in starting thrombolytic therapy by the intracoronary route, attempts at thrombolysis using intravenous agents evolved. In the early 1980s, a new thrombolytic agent produced by recombinant technology was introduced -- recombinant tissue plasminogen activator (rtPA). rtPA was shown to be efficacious at dissolving intracoronary thrombi when administered intravenously.<sup>5</sup> However, the first major study showing a beneficial effect of intravenous thrombolytic therapy on mortality was the first Gruppo Italiano per lo Studio della Streptochinasi nell'Infarto Miocardico (GISSI) study<sup>6</sup> reported in 1986 in which streptokinase was used. Almost 12,000 patients were randomized in a double-blind fashion with 10.7 percent mortality in patients treated with streptokinase vs 13 percent in the placebo group. Shortly after the GISSI study was published, the results of trials using rtPA in comparison with placebo were reported showing similar efficacy in reduction of mortality from an acute MI.<sup>7,8</sup> Topol et al<sup>9</sup> then showed the benefits of using rtPA for the recanalization of coronary arteries in a community hospital.

Based on the results of the GISSI trial<sup>6</sup> and the studies showing efficacy of rtPA in lysing coronary thrombi,<sup>7,8,10,11</sup> the Food and Drug Administration (FDA) approved streptokinase and rtPA for use as intravenous agents in acute MI. In 1987, the first randomized trial of streptokinase vs rtPA was published by the Thrombolysis in Myocardial Infarction (TIMI) study group.<sup>11</sup> This study showed a higher coronary patency rate ninety minutes after the infusion of the thrombolytic agent for patients treated with rtPA compared with those treated with streptokinase, with the greatest differences being seen when the agents were given later in the course of the infarction. There was no difference in mortality in this study although the number of patients enrolled was too small to evaluate mortality as an endpoint. However, the extended conclusion drawn from this study was that the agent that could open arteries faster would potentially have a greater reduction in mortality.

In 1988, the Second International Study of Infarct Survival (ISIS-2) group reported on a large trial of intravenous streptokinase vs placebo with an additional randomization to the use of aspirin (180 mg qd).<sup>12</sup> The majority of patients were studied at community hospitals rather than large university centers. The results showed that aspirin alone could reduce mortality (23.9 percent) from an acute MI to the same extent as streptokinase (25 percent) alone when compared with placebo, but the combination of both aspirin and streptokinase proved to be most efficacious (42.9 percent). With the publication of this study, most physicians began to use aspirin in almost all patients with an acute MI. The other remarkable finding was that elderly patients (age 70+ years) had a larger (8 percent) reduction in absolute mortality from thrombolytic therapy combined with aspirin than did younger patients (2.5 percent). Patients treated with streptokinase between six and twenty-four hours after

the onset of symptoms also had a significantly reduced (14 percent) mortality compared with the control population.

In search of a more clot-specific and easier to use thrombolytic agent, anistreplase or APSAC (anisoylated streptokinase-plasminogen activator complex) was created. Anistreplase is made by complexing streptokinase to plasminogen activator to make the compound more clot specific. This complex is then anisoylated, preventing it from working until the anisoyl group is removed by endogenous enzymes. This allows the agent to be given as an intravenous bolus. Its efficacy was demonstrated in the APSAC dans l'Infarctus du Myocarde (APSIM)<sup>13</sup> and APSAC Intervention Mortality Study (AIMS)<sup>14</sup> trials. In APSIM, anistreplase demonstrated a 77 percent reperfusion rate compared with 36 percent in a group treated with heparin only. In AIMS, anistreplase reduced mortality by 50.5 percent at thirty days and by 43 percent at one year when compared with placebo. Anistreplase was approved for use in the treatment of acute MI in late 1989. A comparison of the three FDA-approved thrombolytic agents can be found in the Table.

**Safety.** Thrombolytic agents are not innocuous drugs. The major complication from thrombolytic therapy is bleeding with a particular concern for intracranial hemorrhage. However, if patients at high risk for bleeding are excluded, the risk of bleeding appears to be mainly associated with instrumentation of the patient. In TIMI-1, there was a decrease in the hematocrit of 15 percent and 16 percent in the rtPA and streptokinase groups, respectively.<sup>11</sup> No intracranial bleeding was noted. In the International t-PA/SK Mortality Study, there was a 0.4 percent and 0.3 percent incidence of hemorrhagic stroke in the rtPA and streptokinase patients with a 0.6 percent and 0.9 percent incidence of major bleeding, respectively.<sup>15</sup> With the addition of heparin in the International Study, the incidence of major bleeding was 0.8 percent in the rtPA cohort and 1.2 percent in the streptokinase

**Table. Comparison of Three Approved Thrombolytic Agents**

Dose	Streptokinase 1.5x10 <sup>6</sup> units Over 60 min	rtPA 10 mg bolus 50 mg x 1 hr 40 mg x 2 hr	Anistreplase 30 mg Over 5 min
Infusion pump needed	Yes	Yes	No
Cost per dose	\$73	\$2,200	\$1,700
Half-life	23 min	5 min	90-105 min
90 min patency	50-70%	70-90%	60-70%
4-7 day patency	80-85%	70-80%	75-80%
Antigenicity/ allergic reactions	Yes (5%)	No?	Yes (5%)
Anaphylaxis	0.2%	0.0%	0.2%
Fibrin specificity	Mild	Marked	Moderate
Systemic fibrinolysis	Marked	Mild	Marked
Heparin required	No?	Yes	No
Bleeding complications (without cardiac cath)	Mild	Mild	Mild
Cerebral hemorrhage	<1%	<1%	<1%

group. In the AIMS study, there was a 14 percent incidence of bleeding, with blood loss requiring a transfusion in only 0.8 percent.<sup>14</sup>

Because of their derivation from streptococcal proteins, streptokinase and anistreplase may cause an allergic reaction in patients who have had a recent exposure to a streptococcal infection or either drug. In the International t-PA/SK Study,<sup>15</sup> streptokinase was associated with allergic reactions in 1.7 percent of patients compared with 0.2 percent of patients receiving rtPA. Hypotensive reactions were noted in 1.7 percent of the rtPA group and 3.8 percent of the streptokinase group. Allergic reactions were noted in 2.5 percent of patients receiving anistreplase.<sup>14</sup> There was a 3 percent increase in the incidence of hypotensive episodes in patients treated with anistreplase compared with placebo in the AIMS Trial.<sup>14</sup> Based on the results of the major trials in which these agents were used, there does not seem to be a major difference in side effects which would routinely favor utilizing one agent over the other.

### Current Controversies

**Mortality.** If the total benefit in reduction of mortality was due to the early patency of the infarct-related artery (as noted on the ninety-minute coronary angiogram), then the late decrease in mortality noted in the ISIS-2 study would not be expected. The TIMI-I trial<sup>11</sup> reported that patients treated after six hours of the onset of symptoms had 20 percent or less reperfusion with intravenous streptokinase. Therefore, the patency rate with streptokinase based on the TIMI-I data is the same as the spontaneous reperfusion noted by DeWood et al.<sup>2</sup> The Plasminogen Activator Italian Multicenter Study (PAIMS) investigators<sup>16</sup> showed equivalent patency four days after the infusion of either rtPA or streptokinase with both groups receiving intravenous heparin. The APSIM investigators<sup>13</sup> also showed significant reperfusion at four days, with the AIMS investigators<sup>14</sup> showing similar reduction in mortality with anistreplase compared with other placebo controlled trials using either rtPA or streptokinase. Therefore, the critical issue should not be whether having an open artery is beneficial, but at what time is an open artery needed.

At this time, rtPA is the most widely used thrombolytic agent used in Baltimore metropolitan area hospitals for treatment of acute MI. However, rtPA is also the most expensive thrombolytic agent and has a difficult dosing regimen, needing to be controlled by an infusion pump with close attention by nursing personnel. Major randomized studies have been performed to determine which agent, if any, has an efficacy and safety advantage. The first large scale trials to ask this question were GISSI-2<sup>17</sup> and the International t-PA/SK Mortality Study.<sup>15</sup> The GISSI-2 trial evaluated the efficacy of rtPA versus streptokinase in reducing cardiovascular events in patients admitted with acute MI.<sup>17</sup> There were 12,381 patients ran-

domized over a seventeen-month period to either receive or not receive subcutaneous heparin starting twelve hours after the initiation of thrombolytic therapy. At the time of discharge from the hospital, there was no difference in outcome between those administered rtPA (event rate 23.1 percent) or streptokinase (event rate 22.5 percent), or between the heparin group (event rate 22.7 percent) or the no heparin group (22.8 percent). Subgroup analysis looking at whether thrombolytic therapy combined with heparin or given alone had any major effects did not show any significant difference among the four groups. Mortality data in the GISSI-2 study did not show any difference among the groups although the study population was too small to analyze for mortality as an independent variable.

The International t-PA/SK Study<sup>15</sup> included all of the patients from GISSI-2, as well as patients from thirteen other countries. The protocol was identical to the GISSI-2 study with half of the patients randomized to rtPA and the other half receiving streptokinase (SK). There was also a secondary randomization to subcutaneous heparin at twelve hours as in the GISSI-2 trial. There was a total of 20,891 patients randomized including the patients from the GISSI-2 trial. In-hospital mortality for patients given rtPA was 8.9 percent and for those given streptokinase it was 8.5 percent. When the patients were subsequently analyzed as to the effect of heparin on mortality, the heparin group had an in-hospital mortality of 8.5 percent compared with an 8.9 percent mortality in the no heparin group. Subgroup analysis showed no difference in mortality when either thrombolytic agent was combined with heparin or given as a single agent (rtPA 8.7 percent, rtPA plus heparin 9.2 percent, SK 9.2 percent, SK plus heparin 7.9 percent). A statistically significant but probably clinically insignificant increase in strokes was seen in the rtPA group compared with the other treatments (rtPA 1.4 percent, rtPA plus heparin 1.2 percent, SK 0.9 percent, SK plus heparin 1.0 percent), with no difference in the number of hemorrhagic strokes among the groups. The incidence of stroke was slightly higher in patients above the age of 70 (rtPA 2.7 percent, SK 1.6 percent). Mortality was also higher in the patients above the age of 70 but there was no differential effect on mortality in the elderly between the two agents examined.

**Heparin Therapy.** The results of these two studies suggest that there is no difference in mortality from treatment with rtPA or streptokinase. However, questions have been raised as to whether heparin was used appropriately in these patients. Two recent trials suggest that immediate intravenous heparin is needed to preserve the patency obtained by rtPA. The first, presented in 1989 by Bleich et al,<sup>18</sup> randomized patients presenting within six hours after the onset of an acute MI and receiving 100 mg of rtPA to either intravenous heparin therapy to keep the partial thromboplastin time (PTT) 1.5 to 2.0 times normal or to no heparin. The patients then underwent coronary angiography at

an average of fifty-five hours post-angioplasty and showed a patent infarct artery in 71 percent of the group treated with heparin compared with 44 percent in the group without heparin. However, there was an increased incidence of bleeding in the heparin group with 64 percent having evidence of bleeding compared with 36 percent in the no heparin group. These data may reflect unfairly on the no heparin group, since a platelet inhibitor (i.e., aspirin) was not used by either group in this study.

In early 1990, Ross et al, reporting for the Heparin-aspirin Reinfarction Trial (HART),<sup>19</sup> showed an advantage of intravenous heparin over aspirin in maintaining patency after thrombolysis with rtPA. Patients presenting within six hours of an acute MI received either 100 mg rtPA and were randomized to treatment with either aspirin 80 mg or intravenous heparin to keep the PTT 1.5 to 2.0 times normal. Initial coronary angiograms were performed at an average of eighteen hours after treatment was initiated. The heparin group had an initial infarct artery patency rate of 82 percent compared with 42 percent in the aspirin group. When those patients with open arteries were studied after seven days, there was a 12 percent reocclusion rate in the heparin group vs a 5 percent reocclusion rate in the aspirin group. This difference did not reach statistical significance.

These latter two studies have been used to criticize the results of GISSI-2<sup>16</sup> and the International t-PA/SK Study.<sup>15</sup> The proponents of rtPA therapy state that heparin was given by the wrong route and too late to allow rtPA to have any benefit over streptokinase. However, Bleich et al<sup>18</sup> did not use platelet inhibitors in their study and the dose of aspirin in the HART<sup>19</sup> may have been too low to be of real benefit. The Studio sulla Calciparina nell'Angina e nella Trombosi Ventricolare nell'Infarto (SCATI) Study<sup>20</sup> showed a beneficial effect from the addition of subcutaneous heparin in the first six hours of streptokinase therapy. ISIS-3 is comparing rtPA, streptokinase, and anistreplase with and without heparin. In ISIS-3, patients are randomized to subcutaneous heparin starting four hours after the onset of treatment. The initial results from this study should be available in early 1991.

**Patency.** In order to determine if early sustained patency is more beneficial than patency during the course of hospitalization, the Global Utilization of Streptokinase and rtPA for Occluded Coronary Arteries (GUSTO) study began in the fall of 1990. The study includes patients within six hours of onset of an acute myocardial infarction. All patients are being given aspirin 160 mg and intravenous heparin to maintain the PTT 1.5 to 2.0 times control. Prior to heparinization, patients are being randomized to receive rtPA a total of 100 mg (or adjusted to weight) over ninety minutes, streptokinase 1.5 million units over sixty minutes, or a combination of rtPA 1 mg/kg over 60 minutes combined with 1.0 million units of streptokinase. Rapid administration of rtPA has been

shown by Neuhaus et al<sup>21</sup> to have a patency rate of 91 percent at ninety minutes persisting at twenty-four hours (92.4 percent patency) with intravenous heparin therapy. GUSTO will attempt to see if this increased patency rate correlates with increased survival. The combination of lower dose streptokinase and lower dose rtPA therapy has been shown to decrease the rate of reocclusion.<sup>22</sup> Therefore, if early patency makes a major difference on survival, one of these regimens should show a significant decrease in mortality. This hypothesis will also be tested in GUSTO.

**Myocardial Preservation.** The argument for early patency is better myocardial preservation. However, left ventricular function, as measured by the ejection fraction, has not differed in studies of direct comparison of rtPA and streptokinase<sup>15,23</sup> or in studies using either agent by itself.<sup>23</sup> No matter which agent is used, the ejection fraction is significantly better after treatment with a thrombolytic agent than without treatment.<sup>24</sup> Most studies show that the earlier the thrombolytic agent is given, the greater the improvement in survival.<sup>6,12,24</sup> The advantage to early treatment may be that fresh clots are easier to dissolve than older clots, no matter which agent is used.

**Infarct Expansion.** Infarct expansion has been documented in both animals<sup>25,26</sup> and humans<sup>27,28</sup> following a myocardial infarction. The etiology of infarct expansion is due to slippage of myocytes and supporting structures.<sup>29</sup> It is possible that by reperfusion the area of infarction, expansion may be prevented and retained ventricular geometry may account for improved left ventricular function (determined by the ejection fraction) and survival, even when reperfusion occurs late.<sup>30,31</sup> To date, there are no studies assessing the influence of thrombolytic therapy on infarct expansion in the human nor are there animal studies comparing the influence of the individual agents on infarct expansion.

**Electrical Substrate Stability.** Recent studies<sup>32-35</sup> have examined effects of reperfusion on the signal-averaged electrocardiogram (SAECG). This procedure records 200 to 300 heart beats from three orthogonal leads, and the complexes are averaged, amplified and filtered, and then morphological characteristics are measured (QRS duration, low amplitude signals at the last 40 ms of the QRS complex, and root-mean-square voltage of the last 40 ms of the QRS complex). Abnormalities of these variables are considered evidence of delayed conduction and are felt to represent a pathophysiologic substrate for ventricular re-entrant tachyarrhythmias. The studies performed thus far have shown a lower incidence of SAECG abnormalities when the infarct artery was patent than when the artery was occluded.<sup>32-35</sup> Importantly, this was independent of the thrombolytic agent used. Therefore, infarct artery patency may be important to preserve electrical stability of the heart.

**Post-thrombolytic Care.** Another controversial area is post-thrombolytic care. Should all patients undergo cardiac catheterization and revascularization by percutaneous transluminal coronary angioplasty (PTCA)

or coronary artery bypass surgery, if possible, following thrombolytic therapy? The proponents of this treatment paradigm state that a significant amount of triple vessel and left main coronary artery disease, notwithstanding the often found high-grade residual lesion of the infarct-related vessel, is discovered on routine post-thrombolysis coronary angiography. However, several recent studies challenge the need for routine angiography after thrombolysis. Almost simultaneously, three studies appeared in early 1988 showing a worse outcome from thrombolysis followed by immediate PTCA than with conservative treatment. In the Thrombolysis and Angioplasty in Myocardial Infarction (TAMI-1) study,<sup>36</sup> immediate PTCA was associated with a higher mortality (4 percent vs 1 percent), an increased requirement for transfusion (21 percent vs 14 percent), and a similar frequency of reocclusion (11 percent vs 13 percent). The European Cooperative Study Group (ECSG)<sup>37</sup> reported similar results in 367 patients treated with rtPA, heparin and aspirin, who were randomized to either immediate PTCA or no PTCA. There was an increased incidence of reocclusion and mortality in the PTCA cohort compared with the conservatively treated group (7 percent with PTCA vs 3 percent with conservative therapy). In the TIMI-II A trial,<sup>38</sup> there was a 12.8 percent rate of complications within twenty-four hours of the PTCA. These studies clearly showed immediate PTCA to be a disadvantage to patients treated with thrombolytic therapy for an acute MI.

Recently, several studies have suggested that for a subgroup of post-thrombolysis patients, an invasive strategy may not be needed. The TIMI-II B trial<sup>38</sup> randomized patients to either PTCA or no PTCA following thrombolysis. There was no significant difference in the forty-two-day and the one-year mortality between the two groups. de Bono et al<sup>39</sup> and Barbash et al<sup>40</sup> reported similar results. Therefore, coronary angiography and revascularization may only be needed for evidence of spontaneous or provoked ischemia following thrombolytic therapy, and do not need to be routinely performed.

### Implications for the Community Hospital

How does all this affect the community hospital? In 1989, thirty-nine of the patients admitted to Sinai Hospital of Baltimore with a diagnosis of an acute myocardial infarction were given thrombolytic therapy. If all had been given rtPA, the cost would have been \$85,800 compared with \$2,847 if streptokinase had been used. Even assuming that 20 percent of the patients could not have been given streptokinase due to a recent streptococcal infection, treatment with streptokinase in the past six months, or prior allergic reaction to streptokinase, the cost to the hospital would still have been only \$19,863. If we assume from the data available that mortality from an MI and subsequent left ventricular function does not depend on the thrombolytic agent used, then all

patients would have done equally well if they were given streptokinase, resulting in a cost savings to the hospital of \$61,537 (Figure 1).

If a patient treated with thrombolytic therapy had routine coronary angiography following myocardial infarction, the cost would be \$585. However, in the patient without spontaneous or provokable ischemia, studies<sup>38-40</sup> show that angiography is not needed. As all patients without spontaneous angina will need a stress test to determine if there is any provokable ischemia, the cost of care to a patient without ischemia following thrombolysis would be only \$75. If the data from TIMI-II B<sup>38</sup> and Barbash et al<sup>40</sup> are used, approximately 40 percent of patients will have evidence of recurrent ischemia in the early post-thrombolytic period and will need coronary angiography. Thus, hospital costs would be lower by \$510 in 60 percent of the patients treated with thrombolytic therapy (Figure 2). Although it would cost \$660 (exercise test and angiography) for a patient without spontaneous ischemia but with provokable ischemia, this represents only 15 percent<sup>38,40</sup> of patients' post-thrombolytic therapy so there would still be considerable savings to the hospital.

In summary, treatment with streptokinase would save \$2,127 per patient and a conservative angiography strategy would save \$510 per patient. The key factor is that the combined savings of \$2,637 per patient probably would not alter the quality of the patient's

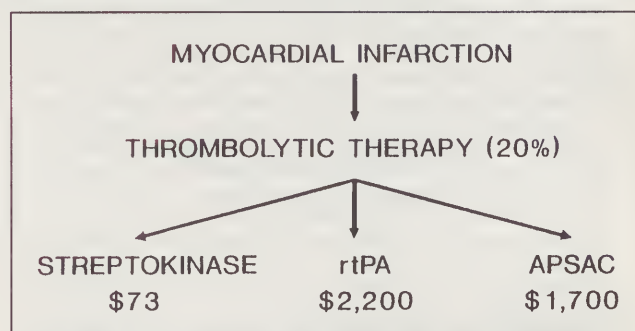

Figure 1. Cost analysis of different thrombolytic regimens in patients with an acute myocardial infarction.

Figure 2. Cost analysis of patients with or without ischemia following thrombolytic therapy comparing invasive vs conservative strategy.

care. In the present era of Diagnostic Related Groupings (DRGs), threats to disallow the Medicare waiver, and decreased Medicare/Medicaid reimbursement, decreasing the cost of care without compromising the quality of care is mandatory. However, not all the answers are available. rtPA may prove to be significantly better than streptokinase and worth the additional \$2,100. The results of the GUSTO Study, which should be available in 1993, may answer that question. As technology develops, it may become worthwhile to follow an invasive strategy following thrombolysis. But as of today, there is no clear-cut benefit from either rtPA or an invasive strategy in the management of post-thrombolysis patients to account for the difference in the cost of caring for a patient with an acute myocardial infarction.

#### Added at Time of Final Proof

Preliminary results of the ISIS-3 trial were reported recently at the meeting of the American College of Cardiology in March 1991.<sup>42</sup> There were 46,092 patients enrolled in this study which evaluated whether there was a difference in mortality among any of the available thrombolytic agents without a significant increase in risk. The preliminary results showed a higher incidence of allergic reactions, hypotension needing treatment, and reinfarction with streptokinase or anistreplase compared with rtPA, and no difference in the rate of major bleeding among the three agents. There was no difference in the thirty-five-day mortality among the three agents, but a 3-4/1,000 increase in intracranial bleeding was seen in the groups treated with rtPA and anistreplase compared with those treated with streptokinase. This increase in the rate of intracranial bleeding with rtPA or anistreplase was highly significant ( $P=0.00001$ ). The addition of subcutaneous heparin to thrombolytic therapy increased the frequency of intracranial bleeding without significantly altering mortality.

The results of the ISIS-3 trial appear to confirm the hypothesis that patients can be treated effectively with thrombolytic agents at a lower cost and possibly with increased safety if streptokinase is the agent of choice. The results of the GUSTO study will determine if more aggressive thrombolytic therapy can significantly improve survival without increasing major morbidity. However, treatment with any thrombolytic agent improves mortality from an acute myocardial infarction. Mortality from acute myocardial infarction can be dramatically reduced in the 1990s if community hospitals increase total and efficient use of thrombolytic agents.

# Glaucoma Treatment and the Laser Revolution

---

Irvin P. Pollack MD

---

*Dr. Pollack is Chief, Department of Ophthalmology, The Krieger Eye Institute, Sinai Hospital of Baltimore and an ophthalmologist at The Wilmer Ophthalmological Institute, The Johns Hopkins Hospital, Baltimore, MD.*

---

*The potential uses of laser energy are only beginning to be explored, but it is only a matter of time before we will be able to predictably alter the internal structures of the eye to better control any type of glaucoma.*

---

**T**he use of radiant energy to treat glaucoma has been a most exciting addition to the therapeutic management of this disease. Lasers were first introduced to ophthalmology in the 1960s<sup>1,2</sup> and have been used in the treatment of glaucoma since the early 1970s when laser energy was first used to create an iridotomy for the treatment of angle-closure glaucoma.<sup>3-5</sup> In large measure, the argon and Nd:YAG (neodymium: yttrium-aluminum-garnet) lasers have been the principal instruments used, but in recent years we have seen experimentation and further development of the ruby, diode, carbon dioxide, excimer, and tunable dye lasers. Although not without its dangers, laser therapy for glaucoma is relatively safe and enables non-incisional surgery to be performed in an office setting without risking infection. The applications of laser energy to the treatment of glaucoma seem infinite and provide us with additional procedures to control this complicated disease.

## Primary Open-angle Glaucoma

Argon laser trabeculoplasty (ALT) is a surgical technique by which laser energy is directed through a prism-containing contact lens or gonioscope (Figure 1) to create a burn in the trabecular meshwork located in the angle of the anterior chamber (Figure 2). Such treatment of the trabecular meshwork was first successfully used to lower intraocular pressure (IOP) in monkeys<sup>6</sup> and later, in humans.<sup>7,8</sup>

Over the years, we have learned through numerous studies that ALT produces a clinically significant decrease in IOP.<sup>9-13</sup> These studies showed that laser treatment to the anterior chamber angle in persons with primary open-angle glaucoma could produce a 30 to 40 percent decrease in IOP, and this resulted from an 80 percent increase in the mean facility of aqueous outflow.<sup>13</sup>

Laser trabeculoplasty has been considered to be the treatment of choice for those persons whose IOP cannot be brought under medical control and for whom surgery is the only alternative. Because of the relative ease with which ALT can be performed and

**Figure 1.** The laser beam is focused through the optical system of a slit lamp and deflected by the gonioscopic prism into the anterior chamber angle. Here the laser produces a series of burns that result in better outflow of aqueous humor.<sup>24</sup>

**Figure 2.** The argon laser beam is directed into the anterior chamber angle where eighty burns are placed on the trabecular meshwork. They are carefully focused and evenly spaced around the angle circumference and result in a decreased IOP within four weeks of laser treatment.

because of the frequent side effects of medical therapy, there has been a tendency to perform ALT and treat patients with open-angle glaucoma at an early stage of their disease. A current multicentered study has been designed to determine whether ALT might be the preferred alternative to medical therapy of any type once glaucoma has been diagnosed.

Unfortunately, this treatment is not without its limitations. Ten to fifteen percent of patients receive insufficient benefit from the treatment and require conventional filtration surgery. Over the succeeding years, a gradual increase in pressure may occur in many, if not most, of the patients in whom there had

been a significant fall in IOP.<sup>14</sup> This may be due to a diminution of the laser effect, progression of the disease itself, or a combination of both.

If the first treatment was successful, why shouldn't a second treatment be even better? And if the first treatment fails, will a second treatment provide the desired result? Various investigators found that the process of treatment and re-treatment delayed effective therapy in many cases, and permitted continued damage to the optic nerve and loss of visual field. Furthermore, there is no way to know where the trabecular meshwork has been treated, and repeated treatment poses a threat of excessive trabecular destruction and irreversible aggravation of the glaucomatous process.<sup>15</sup> However, re-treatment of patients who underwent ALT eight to ten years earlier is under investigation. Trabecular endothelial cells that might have been damaged during the initial treatment have been replaced and re-treatment in these cases may be helpful.

### Secondary Open-angle Glaucoma

ALT has been found useful in treating pigment dispersion syndrome with glaucoma and exfoliation glaucoma. On the other hand, it has little or no usefulness in the treatment of congenital glaucoma, traumatic glaucoma, or glaucoma associated with uveitis.<sup>16</sup>

### Angle-closure Glaucoma

Most cases of angle-closure glaucoma occur in shallow-chambered eyes where the aqueous humor cannot pass freely from the posterior chamber through the pupil into the anterior chamber. This functional pupillary block causes a build-up of aqueous humor in the posterior chamber, leading to a forward shift of the peripheral iris and closure of the anterior chamber angle. Before 1973, angle-closure glaucoma was routinely treated by excising a small piece of peripheral iris (iridectomy), following which the patient was routinely hospitalized for two to four days. Outpatient laser iridotomy was a revolutionary concept and gained acceptance slowly.<sup>17-19</sup> Early research with the ruby laser gave way to development of new lasers with different wavelengths and new techniques for delivering the laser energy, as well as new ways to create the iridotomy itself.

Following its adaption to the slit lamp, the argon laser soon became available in most centers of ophthalmic research, mainly for the treatment of retinal disease.<sup>20-22</sup> Having a wavelength of 455-515 nm, the blue-green beam is transmitted through the refractive

media of the eye with relatively low absorption, and the quality of its burn is dependent on the presence of pigment in the retina, iris, or trabecular meshwork. Its focusing quality made it well-suited for creation of iridotomies to break pupillary block in angle-closure glaucoma.

Using the continuous-wave argon laser, iridotomies were successfully performed in monkeys,<sup>18</sup> Dutch-belted rabbits,<sup>23</sup> and in humans.<sup>3-5</sup> Early experience revealed that a laser iridotomy could be performed with 98 percent success within a few minutes using 1,000 mW with a 50 micron spot for 0.2 seconds.<sup>24</sup>

By this technique, one could dramatically break an acute attack of glaucoma and control chronic angle-closure glaucoma. (Figure 3) The patient experiences minimal or no pain. Mild photophobia, blurred vision and ocular redness is self-limited, and these side effects are controlled with postoperative topical prednisolone eye drops. A major complication was postoperative rise in IOP lasting one to three hours in most patients, but even this complication has been all but eliminated by pretreatment with apraclonidine, a topical alpha-2 agonist.<sup>25</sup>

In about 2 percent of cases, an argon laser iridotomy cannot be successfully performed. Furthermore, there occasionally occurs a thermal insult to the overlying cornea or underlying lens. For this reason, there developed increased interest in a pulsed laser that might succeed when the argon laser failed.<sup>26</sup>

The Q-switched Nd:YAG laser can reliably produce an iridotomy with fewer than ten pulses and with less energy than the argon laser.<sup>27</sup> On the other hand, bleeding from the iridotomy site is a common complication and a major concern. Iris bleeding is more

likely to occur in an inflamed eye, and many surgeons still prefer the argon laser iridotomy where bleeding does not occur, reserving Nd:YAG iridotomy for the uninflamed eye and for argon laser failures. One can also pretreat the site with the argon laser before completing the iridotomy with the YAG laser. Long-term studies indicate that the Nd:YAG iridotomy is as safe as argon iridotomy.<sup>28</sup>

### The Effect of Various Wavelengths

The blue-green argon laser (455-515 nm) and the near-infrared Nd:YAG laser (1064 nm) are the most commonly used wavelengths for creating an iridotomy. The argon laser is also used for trabeculoplasty. However, other lasers employing different wavelengths have been investigated for both of these procedures.

The krypton laser (647 nm) has been successfully used to make iridotomies<sup>29</sup> and the Nd:YAG laser has been used for trabeculoplasty.<sup>30</sup>

An ideal laser might certainly be one that allows any desirable wavelength to be dialed into use. The tunable dye laser using the organic dye, rhodamine-6-G, and having a wavelength of 600 nm emitted in 3 millisecond pulses, has been used to create iridotomies. However, a lower success rate, more bleeding, and pigment dispersion limit the usefulness of this technique.<sup>31</sup>

The semiconductor diode laser (810 nm) may be another alternative. Although still experimental, it has been shown to have a similar success and complication rate to that of the argon laser when used to produce iridotomies in rabbit eyes.<sup>32</sup>

### Current Research

The laser's greatest value is that it can perform intraocular surgery without making an incision in the eye. The laser beam has the capability, under certain circumstances, to reach the internal structures of the eye by passing through the cornea or scleral coat. Under ideal conditions, it will leave the tissue through which it passes undistributed; yet produce the desired thermal response in the tissue on which the laser is being focused.

Transcorneal sclerostomy is the technique by which the argon or Nd:YAG laser is used to drill a hole through the trabecular meshwork and the overlying sclera to produce a defect similar to that produced by a surgical filtration operation. This allows the excess aqueous humor to escape through the sclerostomy and prevents any build-up of IOP. The aqueous humor collects under the conjunctiva on the surface of the eye (filtering bleb) before again entering the blood system.<sup>33</sup>

One can also make a sclerostomy with a continuous-wave Nd:YAG contact endolaser<sup>34,35</sup> or with an argon endolaser.<sup>36</sup> The endolaser is passed through the anterior chamber and burns a hole through the trabecular meshwork and sclera. Here, again, aqueous humor passes through the sclerostomy and forms a filtering bleb on the surface of the eye.

**Figure 3.** An iridotomy can be performed easily with either the argon or Nd:YAG laser with better than 98 percent success. The iris hole allows aqueous humor trapped behind the iris by pupillary block to enter the anterior chamber and gain access to the trabecular meshwork and outflow channels. This produces a prompt decrease in IOP in cases of acute angle-closure glaucoma and better control of chronic angle-closure glaucoma.

Cyclophotocoagulation is a technique by which the ruby laser<sup>37</sup> or YAG laser<sup>38</sup> causes destruction of the ciliary body after passing through the sclera. Cyclo-destruction results in hyposecretion and may produce a dramatic lowering of IOP. However, because of the destructive nature of this treatment and the chance of producing hypotony (phthisis) and visual loss, this technique is reserved for neovascular and end-stage glaucoma where all other treatment has failed.

The concept is a very attractive one and experiments are now being conducted with other lasers including the diode (810 nm). The diode laser has the additional benefit of being smaller and much less expensive than the Nd:YAG laser. The carbon dioxide (10,800 nm), the excimer (193 nm), and the holmium (2.1 nm) lasers are also being investigated for their ability to produce a sclerostomy by making an opening through the sclera and then into the anterior chamber with little or no scarring or bleeding.

### Summary

We are just beginning to see the potential uses of laser energy to treat glaucoma. Each of the lasers described here has technical problems that make them less than perfect, but it is only a matter of time before we will be able to predictably alter the internal structures of the eye to better control any type of glaucoma.

# The Neurosurgical Treatment of Intracranial Aneurysms in the Community Hospital

Ronald J. Cohen MD, FACS

*Dr. Cohen is Assistant Professor of Neurosurgery, The Johns Hopkins Medical School and Attending Neurosurgeon, Sinai Hospital of Baltimore, Baltimore, MD.*

---

*A consecutive series of operations for thirty intracranial aneurysms in twenty-eight patients illustrates that patients with ruptured intracranial aneurysms can undergo surgery safely in an appropriately equipped community hospital.*

---

This paper reports the results of surgical treatment in a consecutive series of patients who underwent operations for intracranial aneurysms. The operations were performed by the author at Sinai Hospital of Baltimore over a nine-and-one-half-year period. The series represents all patients who underwent surgery for intracranial aneurysms for whom the author was the operating surgeon, with no attempt to select or exclude any cases over the time of the study. It is the thesis of the author that both ruptured and unruptured aneurysms can be safely treated at the community hospital level, provided that certain facilities are available.

As more neurosurgeons are trained and enter practice, there is a reduction in the number of major intracranial cases encountered by individual neurosurgeons outside the academic/medical training institution environment. This decrease in the intracranial surgery case load for the average practicing neurosurgeon has led some to argue for centralization of care and, in effect, to restrict certain kinds of neurosurgical cases to large centers. Cranial surgery for aneurysms and tumors has always been a standard by which neurosurgical practices have been judged, as well as acting as a yardstick by which the American Board of Neurological Surgery can assess the activity of particular neurosurgeons.

Two prior articles<sup>1,2</sup> have dealt with the results of infrequent aneurysm surgery. Both of these reports indicate that neurosurgeons with adequate training and judgment can achieve favorable results by operating only occasionally on aneurysm patients, and that this can be accomplished in the community hospital setting.

## Materials and Methods

Twenty-eight patients with a total of thirty aneurysms underwent surgery. There were twenty-one women and seven men, with an age range of twenty-one to seventy-seven years (Table). All cases were operated on at Sinai Hospital of Baltimore. A physician's assistant assisted in twelve cases, including both of the cases in which a patient had two aneurysms and the case with the basilar summit aneurysm. Another neurosurgeon assisted in

**Table. Summary of Clinical Data**

Case No.	Age	Sex	Grade	Location of Aneurysm	Surgical Treatment	Result
1	68	F	III	posterior communicating	clipped	good
2	63	F	I	R middle cerebral	clipped	good
3	35	F	III	anterior communicating	clipped	died
4	77	F	III	anterior communicating	clipped	good

26	35	F	I	R middle cerebral	clipped	good
27	61	F	0	R middle cerebral	clipped	good
28	59	F	0	internal carotid (giant)	R internal carotid ligation	good

eleven cases, and five cases included a general surgical resident assistant.

The locations of the aneurysms were as follows: nine anterior communicating, three middle cerebral, nine posterior communicating, two anterior choroidal, two aneurysms at the junction of the second and third segments of the anterior cerebral artery, one aneurysm at the bifurcation of the internal carotid into the anterior and middle cerebral arteries, one basilar summit aneurysm, and one giant aneurysm of the internal carotid artery.

The least number of cases done in any calendar year was two. This occurred in 1981, 1984, 1986, 1987, and 1988. The most number of cases performed in any calendar year was five, in 1989.

All patients except three presented with subarachnoid hemorrhages. Patient grades on admission were determined by the criteria of Hunt and Hess.<sup>3</sup> There were nine patients who were grade I, five patients who were grade II, eight patients who were grade III, two patients who were grade IV, and one patient who was grade V.

The three patients with unruptured aneurysms were designated as grade 0. An anterior communicating aneurysm was discovered in the first patient during the course of a computerized axial tomography (CAT) scan during evaluation of the patient who had chronic headaches. The second was a patient who underwent angiography for a stroke and was found to have a middle cerebral artery aneurysm ipsilateral to her

symptomatic carotid stenosis. The third was a patient who presented with severe retro-orbital pain and a third cranial nerve palsy secondary to a giant aneurysm of the internal carotid artery.

The time interval between the subarachnoid hemorrhage and the surgical treatment of the ruptured aneurysms varied between one day and sixty-seven days. In general, the patients were studied by four-vessel cerebral angiography as soon as their condition permitted. Surgery was performed as early as possible, usually within the first few days after the hemorrhage, provided that the patient's neurological condition was not deteriorating. During the pre- and postoperative period, all patients were placed on dexamethasone, and nearly all were placed on a calcium channel blocker (currently nimodipine).

All patients, with the single exception of the patient who underwent internal carotid ligation for the giant internal carotid aneurysm, had surgery using a Zeiss operating microscope.

A frontotemporal pterional osteoplastic craniotomy was utilized in all cases, including the basilar summit aneurysm. Hypotensive anesthesia with sodium nitroprusside was employed during the aneurysm dissection in every case, and barbiturate coma was employed as an adjuvant for the clipping of the basilar aneurysm. A variety of anesthesiologists and nurse anesthetists administered anesthesia. None of the cases required lumbar cerebrospinal drainage; instead, microsurgical fenestration of the chiasmatic cistern provided adequate brain relaxation in every instance.

## Results

All the aneurysms in this series were surgically clipped, with the exception of the giant aneurysm which was treated by internal carotid ligation. Since anything less than a clipped aneurysm was regarded as suboptimal treatment, all the aneurysms were dissected microsurgically to allow adequate clipping. In dissecting these aneurysms, two ruptured intraoperatively -- one posterior communicating aneurysm, and the basilar aneurysm which ruptured during the closure of the clip. In both cases, a second clip was applied and the outcome was not adversely affected.

Utilizing the criteria established by Yasargil and Fox,<sup>4</sup> twenty-four of the twenty-eight patients had good outcomes. Sixteen of these were entirely normal at discharge and follow-up, four had very mild naming or amnesic difficulty, and four had third cranial nerve

palsies residual to their aneurysmal rupture. The only patient who experienced a third nerve palsy secondary to the surgery itself was the patient with the basilar artery aneurysm. All the third nerve palsies improved, including that of the patient with the basilar aneurysm and that of the patient with the giant aneurysm following carotid ligation.

One patient had a fair outcome. This sixty-one-year-old woman suffered an aphasic/abulic syndrome secondary to her subarachnoid hemorrhage, and underwent clipping of both a posterior communicating aneurysm and an anterior communicating aneurysm during the same operation. She showed significant neurological improvement but required transfer to a chronic rehabilitation facility.

One patient had a poor outcome. This patient suffered a ruptured anterior choroidal aneurysm and was grade III preoperatively. The separation of the neck of the aneurysm from the anterior choroidal artery was not possible during dissection of the aneurysm and the clip had to be placed across both the aneurysm and the anterior choroidal artery. The patient was left with a dense subcortical hemiparesis but made an otherwise uncomplicated recovery.

There were two deaths. Both patients had suffered massive subarachnoid hemorrhages. They underwent surgery on the third and fifth day after the subarachnoid hemorrhages, respectively, showed no immediate new deficits after the surgery, but developed uncontrollable brain swelling which was unresponsive to medical and, finally, surgical management. These were the only patients in the series in whom cerebral swelling was at all a problem in management.

### Discussion

Subarachnoid hemorrhage from a ruptured intracranial aneurysm represents a life-threatening illness requiring immediate medical management. The early evaluation and treatment of patients suffering from this disease usually take place in an emergency room close to where the ictus occurred. The diagnosis can be made and therapy instituted as arrangements are made for angiography at the earliest opportunity, in keeping with the patient's neurological condition.

The present series illustrates that the treatment of ruptured intracranial aneurysms can be successfully accomplished at the community hospital level. The basic requirements include a well-staffed intensive care unit able to monitor the neurological condition of the patient (intracranial pressure monitors were not used in any of these cases); a neuroradiologist able to perform complete (four vessel) cerebral angiography; an experienced surgical assistant (either a well-trained physician's assistant, resident surgeon or, preferably, another neurosurgeon); an array of surgical equipment including an operating microscope, microinstruments, and an adequate inventory of aneurysm clips and appliers; and anesthesia personnel experienced with hypotensive anesthesia. Most of these essentials

are available in the community hospital setting, and it remains for the individual neurosurgeon to decide whether to make the commitment to treat these complex and challenging patients him/herself, or to transfer the care of these patients to other facilities.

# Stress Testing: Optimal Use of the Various Modalities of Stress Testing in the Diagnosis of Coronary Artery Disease

---

Romulo F. Baltazar MD, FACP, FACC

---

*Dr. Baltazar is Director, Cardiac Non-invasive Laboratory, Division of Cardiology, Department of Medicine, Sinai Hospital of Baltimore, and Assistant Professor of Medicine, The Johns Hopkins University, School of Medicine, Baltimore, MD. Reprints: Romulo F. Baltazar MD, Division of Cardiology, Sinai Hospital of Baltimore, MD 21215.*

---

*Stress testing is useful in the diagnosis of coronary artery disease and in quantitating levels of fitness, evaluating rehabilitation progress, screening exercise-related arrhythmias, and evaluating medication efficacy.*

---

**S**tress testing is useful in the diagnosis of coronary artery disease (CAD) and in the overall evaluation of patients suspected of having cardiac disease. It is helpful in quantitating levels of physical fitness, evaluating the progress of patients engaged in cardiac rehabilitation programs, screening exercise-related cardiac arrhythmias, and evaluating the efficacy of anti-anginal or anti-arrhythmic medications. More recently, the exercise test has been found useful in the stratification of patients with acute myocardial infarction prior to hospital discharge.

Various modalities of stress testing are currently available for the evaluation of patients with chest pain syndromes. The object of this article is to review these different modalities so that the referring physician and the practicing cardiologist may become aware of the developing technologies in this field and be able to use them optimally in patients suspected of having CAD.

## Exercise Stress Testing

Electrocardiographic exercise testing continues to be one of the most important procedures in the evaluation of patients with cardiac disease. It is the simplest, fastest, and least expensive procedure with fairly reasonable sensitivity and specificity for diagnosing CAD. The electrocardiogram (ECG) serves not only as a continuous monitor to ensure the safety of the patient during exercise testing but also provides the primary basis by which myocardial ischemia is diagnosed. ST segment abnormalities can occur during exercise testing in the absence of anginal symptoms, manifest earlier than the onset of pain, and persist much longer after pain has subsided<sup>1</sup> and are, therefore, a sensitive and specific marker for myocardial ischemia.

**Diagnostic Criteria.** The electrocardiographic criterion of a positive ischemic response has continued to evolve ever since exercise testing was first used in the evaluation of patients with CAD. ST segment abnormalities remain the most widely accepted criteria for myocardial ischemia and are based on the appearance of at

least 0.1 mV (1 mm) of horizontal or downsloping ST segment 80 msec after the J point. In addition, there is now evidence to show that slow upsloping ST depression during exercise testing is also associated with significant coronary events similar to the classic ischemic patterns<sup>2</sup>-- many laboratories<sup>2-4</sup> accept slow upsloping ST depression as evidence of ischemia. At least 2 mm of ST segment depression measured from the J point should be present,<sup>2</sup> although Ellestad believes that ST depression of 1.5 mm measured 60 msec after the end of the QRS complex may have the same significance.<sup>5</sup>

ST elevation of at least 1 mm in a patient without previous infarction occurs less often but is more specific than ST segment depression, and is also considered a positive ischemic response. In contrast to ST segment depression which is due to subendocardial ischemia, ST elevation is a more advanced form of ischemia indicating transmural involvement and is usually due to a significant proximal high-grade stenotic lesion<sup>6,7</sup> or vasospasm of a major coronary artery.<sup>8</sup> Unlike ST segment depression which poorly localizes the coronary lesion,<sup>9,10</sup> ST segment elevation provides an accurate anatomic location of the coronary artery involved.<sup>10</sup> ST segment elevation occurring in the anterior precordial leads, especially in leads V1 or aVL, is usually due to a lesion involving the left anterior descending coronary artery.<sup>11</sup> ST elevation of the inferior leads localizes the lesion to the posterior descending coronary artery<sup>9</sup> which is usually due to right coronary artery disease. In patients who have previous myocardial infarction, ST segment elevation occurring in leads with Q waves or leads adjacent to Q waves does not necessarily imply transmural ischemia but is associated with a completely occluded coronary artery, usually with underlying wall motion abnormality including a high incidence of left ventricular aneurysm.<sup>12,13</sup>

Another lesser known but nevertheless highly specific criterion for myocardial ischemia is U wave inversion. One of the reasons why U wave has not been commonly used as a marker for CAD is its very low sensitivity. Although uncommon, it is highly indicative of left anterior descending coronary artery occlusion when induced by exercise.<sup>14</sup>

**Less Specific Criteria.** There are other electrocardiographic measurements suggested as having diagnostic value but they are nonspecific and have not gained wide acceptance as definite criteria of myocardial ischemia. These measurements, however, can be used in conjunction with other electrocardiographic parameters to further improve the diagnostic yield of the exercise test.

Septal Q waves are normally present and are most prominent in V5. It has been noted that the septal Q wave increases in amplitude during exercise.<sup>15</sup> Failure of the septal Q wave to increase implies abnormal septal activation, may be a diagnostic marker of ischemia of the septum,<sup>16</sup> and strongly suggests proximal left anterior descending CAD.<sup>17</sup> Other investigators have not found the septal Q waves to be useful, and

have found them to have less sensitivity and less specificity than ST depression.<sup>18</sup>

It has been observed that an increase or no change in R amplitude in V5 immediately post-exercise when compared with baseline is indicative of myocardial ischemia.<sup>19</sup> This increase has been attributed to an increase in left ventricular volume during ischemia, although subsequent studies have failed to confirm this finding.<sup>20</sup>

The QT interval is corrected for heart rate (QTc) and the QX interval is measured from the beginning of the QRS complex to the point of crossing at the baseline of the ST segment. It was previously suggested that prolongation of the QTc interval<sup>21</sup> and the QX/QT ratio<sup>22</sup> were useful in identifying patients with coronary disease, although more recent studies show that the QTc criterion, as well as the QX/QT ratio, were no better than the ST criterion and were unreliable.<sup>18,23</sup>

It has been shown that correlation of the maximal progression of ST depression relative to heart rate increase is a more precise indicator of myocardial ischemia than ST depression alone. Elamin et al<sup>24</sup> correlated the angiographic findings with the maximal ST/Heart Rate (HR) slope in 206 patients and were able to discriminate thirty-eight patients without coronary disease from forty-nine patients with one-vessel disease, seventy-five patients with two-vessel disease, and forty-four patients with three-vessel disease with 100 percent accuracy. Although this measurement has not been corroborated by others,<sup>25</sup> a number of recent studies have shown that heart rate adjustment of ST segment depression measured as ST/HR slope or ST/HR Index can markedly improve the accuracy of the treadmill exercise ECG in the detection of CAD.<sup>26-28</sup> These observations need further validation.

In addition to the improved ECG criteria, several methods have been used to maximize the efficacy of the ECG in the detection of myocardial ischemia during exercise testing. These include the use of multiple lead systems, the availability of various exercise protocols in an attempt to intensify workloads and attain ischemic threshold, and the identification of various drugs and baseline ECG abnormalities that may interfere with the use of the ECG in the diagnosis of myocardial ischemia.

**Lead System.** The Task Force Report issued by the American College of Cardiology/American Heart Association suggests, with few exceptions, that a minimum of three ECG leads should be monitored and recorded<sup>29</sup> during exercise testing. Increasing the number of leads increases the sensitivity of the exercise test by 8 to 20 percent compared with a single lateral precordial lead.<sup>30</sup> Although the number of leads reported during exercise testing varied from three to more than one-hundred leads, only two of twenty-five patients were missed by a standard twelve-lead system compared with a ninety-three-lead body surface mapping.<sup>31</sup> Therefore, a conventional twelve-lead system or its modification is not only more convenient but should be adequate.<sup>30,32</sup> The three leads used for monitoring should represent an orthogonal XYZ sys-

tem that includes V5 or its equivalent since most of the ischemic changes are recorded in V5.<sup>33</sup> One must, however, be certain that the lead being monitored has sufficient R wave amplitude, since an R wave of less than 11 mm is rarely associated with ST depression, even in patients with multivessel disease.<sup>34</sup> Finally, good quality tracings are necessary at baseline or post-exercise, as well as during exercise testing, since 10 percent of patients with CAD will show ischemic ST depression only during exercise.<sup>35</sup>

**Maximizing Heart Rate Response.** Stress testing as a diagnostic test for CAD is dependent on increases in heart rate, blood pressure and left ventricular contractility during exercise. These factors will result in increased myocardial oxygen demand. If myocardial blood flow is compromised, increases in myocardial oxygen demand result in myocardial ischemia. For myocardial ischemia to be manifested, the exercise workload has to be sufficient. The availability of different exercise protocols for both treadmill and bicycle testing allows one to select the best protocol suitable to the age, physical condition, and capacity of the patient. These protocols can be modified to enable the patient to obtain the highest possible exercise workload. A reasonable estimate of an adequate exercise capacity is the attainment of at least 85 percent of the patient's predicted maximal heart rate, adjusted for age.

For patients unable to exercise with their lower extremities, arm exercise testing using an arm ergometer may substitute for treadmill or bicycle exercise testing. The peak workload accomplished by arm exercise testing is significantly less than that of leg exercise. Balady et al<sup>36</sup> compared treadmill testing and arm ergometry on thirty patients with CAD confirmed by coronary angiography. Although there was no difference in peak heart rate-blood pressure product with either test, ischemic ST depression occurred in 86 percent with leg exercise but in only 40 percent with arm exercise. Arm exercise, therefore, is a reasonable but not equivalent alternative to leg exercise testing in patients who cannot perform leg exercise.

Static exercise consisting of handgrip and weightlifting has an even lower workload compared with dynamic exercise. Wilke and her group<sup>37</sup> studied thirty patients with documented CAD comparing weight-carrying versus handgrip exercise testing. Weight-carrying resulted in greater myocardial oxygen demand with higher heart rate-blood pressure product compared with handgrip. None of the patients demonstrated ischemic responses to either handgrip or weight-carrying. In general, ischemic responses are less frequent with static exercise, even in combination with dynamic exercises.<sup>37</sup>

Finally, in order to attain an adequate heart rate-blood pressure product, it is important that the patient discontinue any medications that will prevent an adequate heart rate-blood pressure response, such as beta blockers and calcium entry blockers, before exercise testing. Abrupt withdrawal of beta blockers, however, could precipitate recurrence of anginal symptoms in

patients with CAD. It has been recommended by the American College of Cardiology/American Heart Association Task Force on Exercise Testing that initial diagnostic testing should be performed without discontinuing the drug.<sup>29</sup>

**Baseline ECG Abnormalities.** Since the ECG is the primary means by which myocardial ischemia is diagnosed, exercise testing in patients with baseline ECG abnormalities usually yields poor results. Patients in this category include those with intraventricular conduction delays, Wolff-Parkinson-White (WPW) syndrome, left ventricular hypertrophy, or those receiving digitalis.<sup>38</sup> Previous anterior myocardial infarction<sup>39</sup> and, in general, women more so than men, have shown limitations in the sensitivity and specificity of the ECG during exercise testing.<sup>40,41</sup> In these patients, the exercise test is usually combined with an imaging procedure such as thallium<sup>40</sup> or echo stress test<sup>41</sup> which yield better information. Other conditions including valvular diseases and mitral valve prolapse can also result in a false-positive exercise response.

**Patient Population.** The sensitivity, specificity, and predictive value of the stress test is highly dependent on the type of population being tested. If exercise testing is performed on a symptomatic population in an age group where coronary disease is prevalent, the predictive accuracy of the exercise test will be significantly higher. Fortuin and Weiss<sup>42</sup> conducted a survey of a symptomatic population involving approximately 1,500 patients; patients had an average sensitivity, average specificity, and predictive value of 65.9 percent, 92.3 percent, and 90.8 percent, respectively. This confirms the efficacy of the standard exercise test in diagnosing the presence of myocardial ischemia. On the other hand, when the exercise test is applied to a population of asymptomatic patients with a low prevalence of coronary disease, the predictive accuracy of the test is significantly limited and varies from 14 to 46 percent.<sup>43,44</sup> These divergent results obtained on two different populations are merely a reflection of the prevalence of the disease in the study populations; the high predictive accuracy reflects the high prevalence of the disease and the low predictive accuracy reflects the low prevalence of the disease in asymptomatic subjects.<sup>45</sup> This is an application of Bayes' theorem.

The exercise ECG, therefore, remains an effective procedure in the diagnosis of CAD with a reasonably good sensitivity and specificity if a symptomatic population with an intermediate or relatively high prevalence of CAD is tested, patients are able to exercise adequately, patients with baseline ECG abnormalities are excluded, and drugs altering the electrocardiographic and hemodynamic response to exercise are eliminated.

### Thallium-201 Stress Test

Thallium-201 exercise testing has been shown to be more accurate with a much higher sensitivity and specificity in detecting CAD than exercise ECG.<sup>46,47</sup>

This advantage involves all subsets of patients including those with electrocardiographic abnormalities, patients on digitalis and diuretics, and those with left ventricular hypertrophy and valvular abnormalities where false positive responses are common. Furthermore, unlike exercise-induced ST depression, thallium imaging can identify regional areas of perfusion abnormality and can, therefore, localize and identify the extent of coronary lesions. This information is extremely useful for patients with previous myocardial infarction and coronary artery bypass surgery, as well as those with multivessel disease who are undergoing coronary angioplasty.

Although the sensitivity of the electrocardiographic stress test has been shown to depend on the level and intensity of exercise,<sup>48</sup> the study by Esquivel et al<sup>49</sup> concluded that this was not the case with planar thallium-201 imaging. They evaluated 288 symptomatic patients with angiographically proven CAD and demonstrated that the level of effort during exercise testing did not appear to influence the overall thallium imaging results except in patients with one-vessel disease. They suggested that thallium-201 imaging should be added routinely for most symptomatic patients undergoing stress testing whose level of effort cannot be predicted before the exercise test. Iskandrian et al,<sup>50</sup> however, were unable to confirm the above findings in a larger series of 461 patients. Using single photon emission computed tomography (SPECT) with thallium-201 imaging, they noted that in patients who were unable to attain 85 percent of their maximal predicted heart rates because they could not exercise adequately, the tomographic thallium images showed perfusion defects in 52 percent, 84 percent, and 79 percent of patients with one, two or three-vessel disease, respectively. In contrast, perfusion defects occurred in 74 percent, 88 percent, and 98 percent of patients, respectively, who had a positive exercise test and were able to exercise adequately. Partial or complete redistribution images consistent with ischemia of patients with one, two, and three-vessel disease were seen in 35 percent, 58 percent, and 56 percent, respectively, of patients unable to exercise compared with 56 percent, 80 percent, and 88 percent, respectively, of patients who could exercise. They concluded that exercise SPECT thallium imaging is significantly better in patients with adequate exercise endpoints than in those with submaximal exercise endpoints. Young et al<sup>51</sup> noted that six of twenty-one patients (29 percent) who had poor exercise performance and had normal submaximal thallium-201 stress tests developed thallium redistribution with dipyridamole on subsequent testing. They concluded that a normal but submaximal exercise thallium test may miss patients with underlying coronary disease. The implication is that if a stress test turns out to be submaximal, the injection of thallium-201 during stress testing should be withheld and a dipyridamole study should be performed instead.

Submaximal heart rate responses are seen in patients unable to exercise and in patients on beta blockers or

calcium entry blockers such as verapamil and diltiazem. Martin et al<sup>52</sup> noted that beta blockers significantly decreased the sensitivity of the thallium treadmill exercise test. Of fifty-eight patients not on beta blockers, fifty-two had an abnormal thallium treadmill test with a sensitivity of 90 percent. In comparison, eighty-eight patients receiving beta blockers had a sensitivity of 76 percent. Fifty-nine percent of patients not on beta blockers achieved greater than 85 percent of their maximal predicted heart rate in contrast to 22 percent in the beta blocker group.

A decline in the sensitivity and specificity of exercise thallium imaging has been recently noted.<sup>53</sup> In earlier studies, the sensitivity and specificity varied from 80 to 90 percent.<sup>54,55</sup> More recent reports show a similar sensitivity of 70 to 85 percent but the specificity has fallen to 50 to 60 percent in both symptomatic and asymptomatic patients.<sup>50,56-57</sup> This low specificity of thallium stress testing has been explained as being due to patient selection. In earlier studies, patients underwent cardiac catheterization on the basis of symptoms and the presence of a positive electrocardiographic stress test. With the acceptance of stress thallium, patients with a negative thallium study are now excluded for catheterization.<sup>57</sup> With the exclusion of patients with a negative thallium study, the population has been skewed to one with a higher prevalence of disease which, according to Bayes' theorem, will decrease the specificity in that population.

Thallium stress testing will remain a useful procedure in the assessment of CAD. The use of SPECT thallium imaging<sup>58</sup> allows examination of the heart using tomographic slices with more improved sensitivity than planar thallium imaging. Recognition of imaging artifacts and the use of newer imaging radionuclides such as technetium-99m isonitrite (RP-30A) can provide better imaging quality than thallium-201 with the concomitant ability to assess left ventricular function using first pass radionuclide angiography.<sup>59</sup> More recently, it has been shown that a second injection of thallium given after redistribution images are completed improves the detection of ischemic myocardium, allowing differentiation between reversible ischemia from fixed perfusion defect.<sup>60</sup> All these innovations will certainly increase the diagnostic accuracy of thallium stress testing.

Although thallium stress testing continues to remain an important procedure in the screening and management of patients with CAD, routine use of thallium-201 imaging for diagnostic stress testing remains controversial. In patient groups with a high prevalence of coronary disease and typical presentation of angina but without associated abnormalities in the resting ECG, the sensitivity, specificity, accuracy, and predictive value of treadmill testing alone did not differ from that of thallium imaging.<sup>61</sup> Given limited resources and the expenses associated with thallium treadmill testing, which in our institution cost six to seven times that of regular stress tests, routine use of thallium exercise testing is not warranted.

## Exercise Radionuclide Ventriculography

Left ventricular performance during exercise testing can be evaluated with technetium-99m using either the first pass approach or equilibrium-gated blood pool scan. The rationale behind radionuclide ventriculography in the diagnosis of CAD is similar to that of exercise echocardiography (i.e., myocardial ischemia will result in wall motion abnormality which can then be detected using an imaging technique). The initial reports on the sensitivity of exercise radionuclide ventriculography for detection of CAD varied from 80 to 95 percent and are comparable with that of exercise thallium scintigraphy.<sup>62,63</sup> The specificity, however, is low and varies from 50 to 70 percent.<sup>64,65</sup> Similar to thallium exercise testing, a decrease in specificity reflecting the selection of patients being tested has been recently observed.<sup>65</sup> Radionuclide ventriculography has the same diagnostic endpoint as echocardiographic stress testing (i.e., the manifestation of regional wall motion abnormalities and assessment of global left ventricular function). Unlike echocardiography however, the tomographic views used in the evaluation of left ventricular function using radionuclide ventriculography are limited since several cardiac cycles are necessary to obtain an image and multiple projections cannot be performed during exercise. This is in contrast to the resting nuclear cardiac blood pool study in which multiple projections are readily available for wall motion analysis. Furthermore, patients undergoing radionuclide ventriculography can exercise using a stationary bicycle but not a treadmill. This is important to consider especially in patients capable of walking on the treadmill since a number of studies have shown that American subjects are more likely to reach peak exercise capacity on the treadmill than on the bicycle.<sup>66</sup> These differences may explain the slightly greater sensitivity of exercise echocardiography compared with radionuclide ventriculography, although the specificity is similar. However, radionuclide angiography can be used in virtually all patients, whereas the success rate of two dimensional echocardiography is less, ranging from 90 to 95 percent using online digital acquisition.<sup>67</sup>

## Stress Echocardiography

With the availability of more sophisticated computer techniques, including the use of online digitized two-dimensional images that can be displayed in quad-screen, there has been a resurgence of interest in the use of exercise echocardiography for the detection of CAD. Side-by-side comparison of pre- and postexercise echocardiograms can be performed; this was not technically possible using a standard video format. This has resulted in better resolution of the images and has eliminated respiratory artifacts by being able to select and display a single cardiac cycle of the best possible quality using a continuous loop. Unlike earlier investigations using the m-mode technique, two-

dimensional imaging allows the evaluation of regional as well as global left ventricular function, and can also provide information about valvular abnormalities, specific chamber enlargement, wall thickening, and pericardial involvement. This makes echocardiographic stress testing unique in the evaluation of patients with suspected CAD. The baseline echocardiogram can provide information (e.g., idiopathic hypertrophic subaortic stenosis, mitral valve prolapse, pericarditis, left ventricular hypertrophy) that would otherwise require additional testing in a patient with chest pain syndrome. Furthermore, stress echocardiography is a cost-effective imaging procedure -- less than half the price of thallium imaging in our institution. It is also noninvasive and does not require injection of pharmaceuticals. Unlike thallium and radionuclide ventriculography, it is devoid of the effects of ionizing radiation and the problems associated with its disposal. With the addition of the Doppler technique, it has become possible to obtain information on valvular competence and flow velocities for evaluation of systolic and diastolic left ventricular function.

Similar to radionuclide ventriculography, stress echocardiography relies on regional wall motion abnormalities as a marker for myocardial ischemia. This concept is based on experimental animal observations that wall motion abnormalities precede ECG changes following the onset of myocardial ischemia.<sup>68</sup> Clinical confirmation was subsequently obtained in patients with angina pectoris who were undergoing exercise testing.<sup>69</sup> Studies have shown that the sensitivity of the echo stress test is superior to exercise ECG<sup>70</sup> especially in the presence of single vessel disease.<sup>71</sup> The diagnostic accuracy of the echocardiogram is similar to that of thallium scintigraphy with an overall sensitivity of 80 to 95 percent and specificity of 85 to 90 percent,<sup>67</sup> whether acquisition of images is performed immediately after a treadmill exercise test or during peak exercise using a bicycle ergometer.<sup>72</sup> Unfortunately, there remains a small group of patients who cannot be imaged echocardiographically, in contrast to thallium and radionuclide ventriculography which can be performed in virtually all patients.

## Alternatives to Exercise Testing in Patients Unable to Exercise

Exercise testing may be clinically indicated in certain patients unable to exercise because of neurologic or orthopedic problems, or because of other debilitating medical conditions. Additionally, a number of patients may be able to exercise but cannot perform adequate levels for a variety of reasons. Alternatives to exercise testing include cardiac pacing and the use of pharmacologic agents with or without cardiac imaging.

## Cardiac Pacing

Atrial pacing requires the insertion of a pacemaker electrode into the right atrium. External pacing can be effected at varying heart rates until the target heart rate

is achieved or until symptoms or ECG changes of myocardial ischemia occur. A less invasive technique involves the transesophageal insertion of a pacing catheter which is swallowed by the patient as a pill electrode and positioned behind the left atrium by electrocardiographic monitoring. The presence of atrial arrhythmias such as atrial flutter or fibrillation and the development of atrioventricular (AV) nodal block during atrial pacing precludes the use of the pacing test although the latter problem could be circumvented using atropine.<sup>73</sup>

The atrial pacing test is associated with a lower sensitivity and specificity compared with a standard dynamic exercise test.<sup>74-76</sup> This is probably because hemodynamic response during atrial pacing is characterized by less catecholamine release compared with dynamic exercise resulting in little change in blood pressure and less myocardial consumption of oxygen. However, Heller and his co-workers<sup>77</sup> reported a sensitivity of 94 percent and a specificity of 83 percent among twenty-two patients studied with atrial pacing. They believe that the low sensitivity and specificity reported in the literature are due to the technical and methodological performance of the test. They noted that previous studies used single channel ECG recorders instead of using multiple leads with V5 during atrial pacing; this could have reduced the diagnostic accuracy of the test. They also suggested that chest pain should not be an endpoint for the termination of pacing since chest pain is not a reliable indicator of CAD.<sup>74,75</sup> Chest pain could be minimized by pacing at 85 percent of the maximal predicted heart rate instead of pacing to 180 or more beats per minute (bpm) which results in a number of false positive responses. Stratman and Kennedy<sup>78</sup> feel that pacing to peak rates of 85 to 100 percent of age-predicted heart rate or 170 bpm, whichever is lower, appears to give the most reasonable balance between sensitivity and specificity.

Atrial pacing is usually combined with an imaging test such as thallium scintigraphy,<sup>79</sup> echocardiography,<sup>80</sup> or radionuclide ventriculography.<sup>81</sup> The addition of an imaging procedure has been shown to increase the sensitivity and specificity of atrial pacing in these studies. Furthermore, with the use of imaging, ventricular pacing (using external chest wall stimulation<sup>82</sup> or permanently implanted atrial/ventricular programmable pacemakers) can be performed which would not be technically possible using ECG alone.

Since the test is invasive or semi-invasive with a relatively low sensitivity and specificity, atrial pacing has not been used as extensively as the other available modalities of exercise testing.

### Pharmacologic Stress Testing

A variety of agents are presently used for pharmacologic stress testing. The most common are the vasodilators consisting of dipyridamole, papaverine hydrochloride and, more recently, adenosine and the inotropic agents consisting of dobutamine, dopamine, and isuprel.

### Dipyridamole

Experience with intravenous dipyridamole has been the most extensive compared to the other available pharmacologic agents. Dipyridamole is available in oral form as a prescription drug. The intravenous form is not commercially available and is currently classified as an investigational agent.\* The dipyridamole test can be given orally or intravenously. The patient should fast for approximately three hours before the test and avoid tea, coffee, and cola since xanthine can attenuate the effects of dipyridamole. Likewise, theophylline-containing medications should be discontinued. The oral dose is given as a single 200-400 mg dose. Absorption is slow and requires a longer monitoring period than intravenous (IV) dipyridamole. Because of its variable absorption, accurate timing for the injection of thallium (which should be at peak blood levels) is uncertain; thus the IV dose of dipyridamole is preferred.

Dipyridamole is a potent coronary vasodilator when given intravenously or orally. It increases endogenous adenosine concentration by inactivating adenosine deaminase and by blocking cellular uptake of adenosine.

Accumulation of adenosine results in coronary vasodilatation with an increase in coronary blood flow to approximately three to five times baseline.<sup>83,84</sup> The overperfusion of normal areas with reduced flow to areas with stenosis results in a "steal" phenomenon. Thallium uptake is enhanced in overperfused areas and is diminished distal to the stenosis where coronary perfusion pressure is reduced and shows as a regional perfusion defect during thallium imaging.<sup>85</sup> The perfusion abnormality is not necessarily accompanied by symptoms or ECG changes since no significant increases in myocardial oxygen consumption are present.<sup>86</sup> That these perfusion abnormalities represent myocardial ischemia has been corroborated by several echocardiographic studies<sup>87,88</sup> in which the wall motion abnormalities coincided with perfusion defects. This makes thallium imaging well-suited for dipyridamole testing since the perfusion abnormalities occur earlier and are independent of the presence of myocardial ischemia. Using a standard dose of 0.56 mg/kg dipyridamole given intravenously over four minutes (low dose), thallium imaging has a sensitivity of 70 to 80 percent compared with dipyridamole echocardiography which has a lower sensitivity of 50 to 60 percent.<sup>89,90</sup> Increasing the dose of dipyridamole to 0.84 mg/kg of body weight over ten minutes (high dose) further increases the sensitivity of the echocardiogram<sup>91</sup> to become comparable with that of thallium, although no apparent increase in sensitivity of thallium imaging could be demonstrated at this higher dose level.<sup>83,92</sup> Thus, dipyridamole echocardiography and dipyridamole thallium stress tests have comparable sensitivities using different doses.

The mechanism for this lack of increased sensitivity

\* Editor's Note: Since submission of this article, intravenous dipyridamole has been approved by the FDA for stress testing.

from thallium using higher doses of dipyridamole appears to be the difference in the diagnostic endpoint for thallium compared with that of echocardiographic stress testing. The thallium dipyridamole test is based on its ability to detect perfusion abnormalities. Increasing the dose of dipyridamole does not significantly increase the occurrence of regional perfusion abnormalities already present at low doses. Instead, higher doses of dipyridamole cause further hemodynamic alterations including a slight increase in myocardial oxygen demand, thereby increasing the ischemic potential.<sup>92</sup> This is usually accompanied by symptoms of angina and by ECG abnormalities. Echocardiography, radionuclide angiography, or other procedures using regional wall motion as a marker for myocardial ischemia will, therefore, have a higher sensitivity with higher doses of dipyridamole. This higher dose of dipyridamole is apparently well-tolerated without loss in specificity and with no apparent increase in risk to the patient.<sup>91</sup>

Several studies have shown that the sensitivity, specificity, and predictive accuracy of dipyridamole thallium for detection of CAD is comparable with that of dynamic exercise testing.<sup>93,94</sup> Since the sensitivity of thallium exercise testing is dependent on an adequate exercise level and is relatively poor in patients who cannot achieve at least 85 percent of target heart rates,<sup>50,51</sup> dipyridamole thallium stress testing provides a better alternative for this group of patients. A recent study has shown that dipyridamole thallium stress testing can be safely performed on post-myocardial infarction patients receiving thrombolytic therapy and that thallium tomography identified more patients with residual ischemia than post-myocardial infarction exercise treadmill tests (74 percent to 28 percent, respectively).<sup>95</sup> Furthermore, there is clinical information that the addition of exercise<sup>96</sup> or handgrip<sup>97</sup> to intravenous infusion of dipyridamole improves the diagnostic accuracy of the test over dipyridamole alone, and that the diagnostic accuracy of the test is not affected by propranolol therapy.<sup>93</sup>

**Electrocardiographic Testing.** The ECG during dipyridamole testing has very low sensitivity and varies from 8 to 62 percent.<sup>92</sup> The higher sensitivity is seen with higher doses of dipyridamole and is comparable to that of dynamic ECG exercise testing. Because of this low diagnostic yield, dipyridamole testing should be combined with an imaging procedure to improve its diagnostic accuracy, even among patients without baseline ECG abnormalities. Combining dipyridamole with low level treadmill exercise testing has been shown to be safe with a higher incidence of ischemic ECG abnormalities compared with dipyridamole alone.<sup>96</sup>

**Dipyridamole Echocardiography.** Using the standard dose of dipyridamole (low dose), echocardiography has a lower diagnostic yield than thallium with a sensitivity of 50 to 60 percent for echocardiography<sup>89,90</sup> and 70 to 80 percent for thallium. Increasing the dose of dipyridamole (high dose) increases the sensitivity of echocardiography to 74 percent,<sup>91</sup> becoming com-

parable with that of thallium. This is due to the difference in diagnostic endpoints between these two tests; thallium scintigraphy can detect perfusion abnormalities before myocardial ischemia manifests. Both echocardiographic and thallium tests have excellent concordance in the baseline wall motion abnormality identified by echocardiography to the fixed perfusion defect identified by thallium scintigraphy, and the onset of new wall motion abnormality during exercise to the location of reversible ischemia during reperfusion.<sup>87</sup>

Dipyridamole echocardiography has been combined with exercise (dipyridamole exercise-echocardiography) in an attempt to further increase the diagnostic accuracy of the dipyridamole echocardiography test.<sup>97</sup> Theoretically, the increased myocardial oxygen demand brought about by exercise can potentiate the reduction in myocardial oxygen supply due to maldistribution in blood flow caused by dipyridamole; combining the two effects could synergistically result in a more accurate test. In one study,<sup>97</sup> twenty of twenty-four patients (88 percent) with CAD were identified as positive with echocardiography and ten of twenty-four (42 percent) by ECG. The specificity was eighteen of nineteen for echocardiography and nineteen of nineteen for ECG. What is significant is that these patients had previously failed a high-dose dipyridamole echocardiography test before they were enrolled in a combined dipyridamole exercise-echocardiographic study. Whether dipyridamole testing in combination with exercise will be safe to perform, especially in patients with CAD, remains to be verified. Further confirmation of these results is needed to define the usefulness of this combined procedure.

Between 1978 and 1985, the safety of intravenous dipyridamole thallium was reviewed on 3,911 thallium-imaging patients collected from sixty-four investigators. There were two deaths because of myocardial infarctions, two nonfatal myocardial infarctions, and six cases of bronchospasm. Chest pain occurred in 19.7 percent, headache and dizziness in 12.2 percent and 11.8 percent, respectively, and ST-T changes in the electrocardiogram were seen in 7.5 percent. Use of parenteral aminophylline brought complete relief in 96.7 percent, with a dose ranging from 10 to 600 mg and averaging 137.4 mg. There is increased risk for bronchospasm in patients with a history of asthma and a potential for increased risk for ischemic events in patients with a history of unstable angina.<sup>98</sup>

### Adenosine Stress Testing

Recently, adenosine, a potent coronary vasodilator has become commercially available. It could substitute for dipyridamole which is also dependent on endogenous concentrations of adenosine to achieve coronary vasodilatation. Initial studies using adenosine SPECT thallium imaging and 2-D echocardiography compared to SPECT thallium<sup>99</sup> appear to support the role of adenosine as a new pharmacologic stress test for the detection of CAD.

## Beta Adrenergic Agents

Dobutamine, dopamine, and isoproterenol are beta-adrenergic agents that induce myocardial ischemia by increasing myocardial oxygen consumption. These beta agonists are very potent inotropic agents but have variable effects on heart rate, blood pressure, and coronary flow. With the availability of imaging, especially the dobutamine-echocardiography stress test, there has been a resurgence of interest in the use of these agents for pharmacologic stress testing. Dobutamine stress testing will be discussed as representative of this group.

**Dobutamine Stress Test.** Dobutamine is a beta-1 beta-2 adrenergic agent with alpha activity. It induces myocardial ischemia by its potent inotropic activity. Increases in heart rate and systolic blood pressure occur at higher doses.<sup>100</sup> In addition to increasing myocardial oxygen demand by increasing heart rate-blood pressure product, significant coronary dilatation with an increase in coronary flow can occur leading to "coronary steal" in patients with CAD.<sup>101</sup> Unlike dipyridamole however, dobutamine consistently increases myocardial oxygen consumption. The dose varies from 5 to 20 ug/kg/min,<sup>102</sup> although a wider dose range of 5 to 40 ug/kg/min<sup>103</sup> has also been used. Since the drug is administered by continuous intravenous infusion, the dose could be titrated and individualized according to patient tolerance, which is often influenced by the severity of the coronary disease. In a group of post-myocardial infarction patients, Mannerling et al<sup>104</sup> noted that the early onset of ST segment depression was associated with a lower tolerated dose of dobutamine. Segar et al<sup>105</sup> correlated the dose of dobutamine and heart rate on forty-four patients with a positive dobutamine echocardiographic test. They concluded that a low dose or a heart rate of less than 125 bpm indicated multivessel disease or severe single vessel disease, and that those having heart rates greater than 125 bpm had moderate disease or had collateral flow.

The dobutamine stress test, in combination with an imaging procedure such as echocardiography or thallium, surpasses the efficacy of the ECG when used alone in diagnosing CAD. Mason et al<sup>102</sup> studied twenty-four patients and compared the ST segment response to exercise testing with that of dobutamine infusion. The sensitivity and specificity of ST depression during exercise testing was 60 percent and 63 percent, respectively, and during dobutamine infusion, 57 percent and 87 percent, respectively. Thallium scintigraphy which was also obtained during dobutamine infusion detected reversible ischemia in fifteen of sixteen patients with CAD (sensitivity, 90 percent) and one of eight controls (specificity, 87 percent). Thallium scintigraphy, therefore, significantly improved the sensitivity of dobutamine stress testing in the diagnosis of CAD.

Using echocardiography as an imaging procedure, Berthe et al<sup>88</sup> evaluated the safety and efficacy of

dobutamine stress testing on thirty patients five to ten days post-myocardial infarction, and concluded that dobutamine stress testing was well-tolerated and that the accuracy of stress testing and 2-D echocardiography was higher than that of exercise ECG (87 percent for echocardiography and 59 percent for ECG). Palac et al<sup>103</sup> also studied sixteen patients using 2-D echocardiography and concluded that the sensitivity and specificity of the dobutamine stress test using 2-D echocardiography were equal to that of 2-D echocardiographic dynamic exercise testing.

## Conclusion

Stress testing remains an important and useful procedure in the diagnosis and evaluation of patients with CAD. Various modalities of stress testing are currently available for a diverse group of patients including those who are able to perform dynamic exercise, those who can exercise but are unable to attain adequate workloads, those who are unable to exercise with their lower extremities, and those who cannot perform any exercise for a variety of medical and noncardiac reasons.

Dynamic stress testing remains the simplest and most effective procedure for most patients who can exercise adequately. If applied to an appropriate patient group it has almost the same diagnostic accuracy as any imaging stress test. The addition of an imaging stress test consisting of thallium-201, radionuclide ventriculography, and echocardiography increases the sensitivity, specificity, and predictive accuracy of the exercise stress test, especially among women patients and those with baseline ECG abnormalities, valvular diseases or left ventricular hypertrophy, as well as patients on digitalis. However, the diagnostic accuracy of these imaging tests is dependent on the ability of the patient to perform an adequate level of exercise. For patients unable to exercise with their lower extremities, the use of a bicycle arm ergometer is a reasonable alternative but not a substitute for leg exercises. Isometric or static exercises such as handgrip and weightlifting are completely unreliable if used as a diagnostic test for CAD. Cardiac pacing remains an option for these patients where pharmacologic stress testing may not be readily available. Pharmacologic stress testing combined with imaging is currently emerging as the most important and useful alternative to dynamic stress testing. Since the diagnostic accuracy of these tests equals that of a patient who can perform an adequate dynamic stress test, pharmacologic stress testing has opened up a new population of patients who were previously unable to be tested because of a variety of medical problems. Of the pharmacologic agents currently used, dipyridamole stands out as a unique agent since perfusion abnormalities can be detected by thallium imaging without a significant increase in myocardial oxygen demand. Preliminary studies with adenosine, a newly available pharmacologic agent, seem to share the same diagnostic accuracy of dipyridamole. Of the different imaging modalities available, thallium scintigraphy is

the most sensitive when flow disturbance is a diagnostic endpoint and is, therefore, best combined with dipyridamole testing. Echocardiography stands out as a very cost-effective procedure, sharing the same potential when higher doses of dipyridamole are used or when dobutamine is the pharmacologic agent of choice.<sup>106</sup>

My heartfelt gratitude to Ms. Judith Frank for her expert secretarial assistance.

## Luxury Homesites

### ABOUT VILLAGER

The Villager name stands for quality built homes and personalized service: use our architects or yours, build on your lot or ours. We can arrange financing, locate a lot for you, and can even sell your old house! So, compare what Villager offers.

### PIKESVILLE

HELMSLEY COURT LOT 18 - Level treed lot, your architect or ours. One of the last available lots in this prestigious neighborhood. Public water, sewer & gas. Ft. Garrison Elementary.

### CAVES VALLEY

HUNTINGTON - Large wooded lot on private drive overlooking new golf course. Excellent investment/superior well yield. Purchase lot or custom build with us.

### NEW

### HILLSTEAD

KNOLLCREST FARMS LOT 3 - Fully wooded, beautiful acre plus lot with 11 GPM well. Located at Falls Road and the Beltway for close-in easy access. Build in a neighborhood of million dollar homes. Custom home with lot from \$450,000.

The EURO/CLASSIC 1

Lots now also available at Huntspring in Ruxton and Worthington Park in Owings Mills.

**VILLAGER**

# Drug Interference on Alpha-fetoprotein Assays

---

Phillip J. Goldstein MD, Shan G. Sundaram PhD  
and Saravanan Manimekalai PhD

---

From Sinai Hospital of Baltimore where Dr. Goldstein is Chief of Services and Chairman of the Department of Obstetrics and Gynecology; Dr. Sundaram is the Director of the Gynecologic Endocrine Laboratory; and Dr. Manimekalai is the Assistant Director of the Andrology Research Division.

---

*Due to the in vitro effects of drugs on human alpha-fetoprotein (AFP) assays, clinicians should review a patient's medication history before interpreting a low maternal serum AFP and proceeding with more tests.*

---

A patient with generalized absence seizures (petit mal) presented to prenatal care at eight weeks of gestational age. She was taking 600 mg of phenytoin each day. Her maternal serum alpha-fetoprotein (MSAFP) at sixteen weeks was reported as undetectable and subsequent fetal ultrasound revealed "probable unilateral renal agenesis with contralateral multicystic kidney disease." Pregnancy was terminated at eighteen weeks and the diagnosis was confirmed by fetal autopsy. In two earlier cases with similar diagnoses, MSAFP was reported to be within normal limits, although the decade old reports did not detail the normal range or the technique used to measure the MSAFP.<sup>1</sup> Therefore, we thought that the undetectably low MSAFP in our patient might be due to phenytoin or its metabolites reacting with MSAFP, rather than the prenatal pathology found in the fetus. The undetectably low MSAFP prompted us to investigate drug interactions with AFP.

MSAFP is generally quantified by radioimmunoassay (RIA) and enzyme immunoassay (EIA) techniques. Before clinical interpretation, the measured value is usually adjusted for variables such as maternal age, weight, and weeks of gestation. Elevated MSAFP has been established as an effective screening method for some congenital malformations, especially open neural tube defects.<sup>2</sup> Low MSAFP has been used for detecting aneuploidy, especially Down's syndrome.<sup>3,4</sup> Low MSAFP can be found in obese gravidas and in pregnant insulin-dependent diabetics, also prompting laboratory corrections.<sup>5,6</sup>

Most of the commercial RIA and EIA kits for the assay of MSAFP have been designed to be more precise at medium and high concentrations rather than low concentrations.<sup>7,8</sup> Using such kits to measure MSAFP to predict Down's syndrome may result in imprecise values. If drugs also artificially reduce MSAFP, additional false positive, Down's syndrome diagnoses may be made, leading to unnecessary intervention and anxiety in women with otherwise normal pregnancies. In this paper, we report our findings on the *in vitro* effects of drugs on human AFP assay.

## Materials and Methods

Pools of sera from pregnant women were analyzed in replicate by an RIA from Amersham Corporation, Arlington, IL and by an EIA from Hybritech Inc., San Diego, CA. A Micromedic Autogamma Counter/MACC Data Reduction System and a Hybritech Photon Immunoassay Analyzer were used for the RIA and EIA assays, respectively. AFP quantified in ng/ml was mathematically converted into IU/ml by using the equivalence of ng to IU ( $1.0 \text{ ng/ml} = 1.09 \text{ IU/ml}$  in the RIA and  $1.0 \text{ ng/ml} = 0.89 \text{ IU/ml}$  in the EIA). Pooled sera used for the experiments had mean AFP values varying from 30 to 75 IU/ml. Our most utilized pool had an AFP concentration of  $51.9 \pm 1.2 \text{ IU/ml}$  by RIA. The percent intra- and inter-assay coefficients of variations determined in our laboratory were 2 and 7 by RIA, and 4 and 10 by EIA, respectively, which were within the limits claimed by the kit manufacturers.

Forty-four commonly used medications in their pharmaceutical forms were evaluated. They were obtained from the hospital pharmacy and the amount of active drug in a pill, capsule, or vial was obtained from the literature (e.g., *Physicians' Desk Reference*, data sheet from the drug manufacturer). Active drugs in study medications are depicted in Table 1. The appropriate weight of the pill or the contents of the capsule or vial needed to give a 1 percent final concentration (by weight) of the active drug in the reaction mixture was calculated and added to aliquots of pooled sera. This calculated weight varied from medication to medication depending on the additional weight of the fillers or stabilizers present. In the initial experiment, we selected representative medications frequently used for a variety of common illnesses.

The medication was added to 5 ml of analyzed pooled sera (APS) in a volumetric flask to give a 1

percent active drug solution (experimental). Any increase in volume was noted. An equal volume of zero standard AFP diluent was added to 5 ml of APS without medication in another flask (control) for volume correction. Each experimental solution had its own control. It was necessary to use the diluent for volume correction because distilled water or a 4 percent albumin solution adversely affected the assay matrix and the assayable AFP in the diluted solutions.<sup>9</sup> The experimental and control solutions were incubated overnight at 37°C to maximize the drug-binding to AFP. The incubated solutions were assayed for AFP concentration by RIA technique.

To unify data, the concentration of AFP (in IU per ml) in the control was equated to 100 percent and the concentration in the experimental was expressed relative to the control value (i.e., percent of control). The experiments and assays were done in duplicate; the means of four values from each experimental and corresponding control were compared by paired t-test using a computer program from NCSS, Kaysville, UT.

Fifteen medications which lowered AFP by at least 10 percent from the corresponding control value were further evaluated. We measured the effect of each of these drugs on AFP at a peak drug blood level, rather than at 1 percent concentration. Peak drug blood level, usually in microgram per ml concentration (termed as 1x unit per ml) for each drug, was obtained from the literature. Since weighing of such small amounts for direct addition of the medication to APS to obtain a final 1x concentration of the active drug might be inaccurate, a concentrated solution (100x) of each medication in the diluent was made. The appropriate volume of that concentrated medication solution was added to 2 ml of APS to produce the experimental solution. An equal volume of diluent was added to the control solution for volume correction. The experimental and control sera were incubated overnight at 37°C and assayed for AFP concentration by RIA technique.

We also considered the possibility that the constituents of the medications might have significantly altered the RIA assay parameters such as the pH or ionic strength, thus producing the observed results. We developed a different protocol to rule out such a design flaw. We repeated the above experiment for six positive medications but assayed AFP using an EIA technique. The assay parameters for the RIA and EIA techniques are quite different from each other and the medication would not be expected to affect those parameters in a similar fashion. Additionally, we measured the pH but not the ionic strength of the drug-treated sera, recognizing that only a major alteration in ionic strength would change the pH.

## Results

Table 1 lists the different medications ( $n = 44$ ) initially screened in their pharmaceutical forms at 1 percent concentration. The medications that lowered the

**Table 1. Drugs Studied at 1 Percent Concentration**

1. Digoxin	23. Chlorpheniramine maleate
2. Metronidazole	24. Verapamil hydrochloride
3. Levothyroxine sodium	25. Aminophylline
4. Penicillin V Potassium	26. Sulfasalazine
5. Prednisone	27. Phenytin
6. Primidone	28. Chlorothiazide
7. Aspirin	29. Ultralente Iletin I (Zn)
8. Methyl dopa	30. Humulin L-1
9. Chloramphenicol	31. Lente-Iletin-I (Zn)
10. Cephalexin	32. Lente-Iletin-II (Pork, Zn)
11. Chlorpromazine HCl	33. Lente-Iletin-II (Beef, Zn)
12. Hydrocortisone	34. Humulin R

21. Propranolol HCl	43. Protamine AN & Iletin II
22. Amoxicillin/clavulanate	44. Semilente Iletin I (Zn)

Analyzed pooled sera were incubated overnight at 37°C with 1 percent drug, and assayed for AFP by RIA

AFP from the corresponding control by at least 10 percent and that were further studied at 1x concentration are listed in Table 2. Of the fifteen medications, nine significantly reduced AFP. Four insulins lowered AFP by 14, 8, 8, and 8 percent. Erythromycin, propranolol, methyldopa, acetaminophen, and aspirin lowered AFP by 9, 10, 63, 18, and 19 percent, respectively (Table 2).

When AFP was measured by EIA, the pattern of reduction in assayable AFP was similar to that obtained by RIA technique (Table 3). For example, methyldopa reduced AFP by 54 percent using EIA and by 63 percent using RIA; aspirin reduced the AFP by 24 percent using EIA and 19 percent using RIA. The pH of the drug-treated sera was not significantly different from that of the control sera.

## Discussion

Merkatz and others have shown a high correlation between low MSAFP and fetal aneuploidy, especially Down's syndrome.<sup>3</sup> Cuckle and his associates have

even advocated routine screening to identify an additional 20 percent of infants so afflicted in the low-risk population of pregnant women under age 35.<sup>4</sup> Prior to proceeding to other tests such as amniocentesis, clinicians now routinely consider several factors that might affect MSAFP values. These modifying factors include accurate gestational age, maternal weight, age, race, multiple gestation, and diabetes. We suggest that the clinician should also consider the ability of an assay to measure low levels of AFP with accuracy and precision, and the use of prescription and over-the-counter medications by the patient for different ailments.

Our rationale for this suggestion is as follows: More than a dozen manufacturers sell kits to measure AFP. Polyclonal or monoclonal antibodies are used, and an EIA or RIA technique is employed for the assay. Each manufacturer explicitly states that assays from different manufacturers can vary due to differences in assay methods and reagent specificity, and that values obtained with different AFP assays cannot be used interchangeably. Furthermore, the kits have traditionally been designed specifically to measure AFP with accuracy and precision in the middle and upper range. This range is of importance in screening for neural tube defects. The low 0 to 20 IU/ml range of importance in screening for Down's syndrome is less reproducible in such test kits.

Our studies showed a significant impact on MSAFP concentration by two commonly used assay techniques in the presence of a variety of medications. If our observation that common prescription and over-the-counter medications cause a factitious reduction of AFP is valid, then this reduction would increase the frequency of extended evaluation of Down's syndrome. Therefore, it becomes important for the clinician to consider the medication history of the patient or to devise a way to overcome the effect of drugs on the AFP value.

Drug interference in clinical tests is not a unique observation.<sup>10</sup> Several drugs bind human AFP similar to drug interactions with albumin.<sup>11</sup> In any AFP assay, the antibody must recognize the antigenic site. The drugs bound to the sites may interfere with such recognition by simple conformational obstruction yielding lower results in the assay. Our results may be due to this effect.

It is conceivable that the observed lowering effects may be due to the fillers and stabilizers present in the drug formulations and not specifically the drugs themselves, or a combination of both. We designed our study based on the rationale that medications taken by patients have fillers and stabilizers and are not in pure chemical form. We attempted, in other experiments, to study the effect of the pure chemical form of drugs but our data were variable and erratic in replicate experiments. For example, the drugs had to be dissolved in ethanol or aqueous ethanol to obtain a homogeneous solution. However, we were then not sure of the extent of the solubility of the drug in the resulting drug-sera mixture or of its interactions with, or denaturation and precipitation of, serum proteins by

**Table 2. Drugs Affecting MSAFP at 1 Percent Concentration and at Peak Blood Levels**

Drug Added	AFP Assayed (As Percent Control)
Control (No drug)	100 %
Ultralente Iletin-I	86 ± 4*
Semilente Iletin-I (Zn)	92 ± 3*
Protamine Zn Iletin-II (Pork)	88 ± 7
NPH Iletin-II (Beef)	92 ± 5
Regular Iletin-I	92 ± 4*
Humulin R	92 ± 1*
Humulin N NPH	93 ± 12
Lente Iletin-II (Pork)	94 ± 4
Humulin L-1	92 ± 6
Sulfasalazine	89 ± 4
Erythromycin	91 ± 1*
Propranolol	90 ± 1*
Methyldopa	37 ± 28*
Acetaminophen	82 ± 4*
Aspirin	81 ± 4*

Assayed pooled sera with AFP were incubated overnight at 37°C with each drug at a final concentration of peak blood level (1x), AFP assayed and expressed as percent of control (no drug) value; the values are mean ± standard deviation of data from four values. \* = p value at 0.05 or less.

**Table 3. AFP Levels Measured by Radioimmunoassay and Enzyme Immunoassay**

	% Control	
	RIA	EIA
Control	100	
Aspirin	81 ± 3.6	76 ± 5.2
Acetaminophen	82 ± 0.9	84 ± 1.8
Erythromycin	91 ± 2.4	92 ± 3.1

RIA = Radioimmunoassay; EIA = Enzyme immunoassay; experimental conditions were as in Table 2, except the incubated sera were assayed for AFP by both techniques

# THE MRI CENTER AT MARYLAND GENERAL HOSPITAL — A NEW RESOURCE FOR MARYLAND PHYSICIANS

Maryland General Hospital has installed a Picker Vista MRI 1.0 Telsa Scanner. This system permits high resolution, thin slice imaging capability and small fields of view, all with superior image quality.

Our System and services offer many benefits to area physicians...

- Convenient patient appointments.
- A dictaphone voice retrieval system which allows instant access to dictated MRI reports from any telephone including home, office or even car phones.
- A large magnet gantry and table to accommodate large or obese, and claustrophobic patients up to 300 lbs.
- Twenty-four hour or less report turn around.
- A financial counselor to facilitate MRI payments.
- Actual copy of study available to physician upon request.

The MRI Center at Maryland General Hospital  
827 Linden Avenue Baltimore, Maryland 21201  
301-225-8121

- EXTRA and the "Thermolds" shoes
- Accomodative, impression molded inlays, for proper weight distribution, made of PLASTIZOTE or PELITE
- Complete line of SPENCO products
- Custom MOLDED footwear as required
- Outside fitting in home or hospital
- Also—Complete prescription service, including many special purpose shoes and shoes suitable for brace attachment

ethanol during subsequent incubations. In a different protocol, sodium salicylate instead of buffered aspirin was added to the serum, and the serum was analyzed with no significant change in the AFP assayed.<sup>12</sup> The lack of incubation and use of a metabolite form of the chemical instead of buffered aspirin might have produced the observed negative results in that study.

The pharmacologic form in which a drug is carried to the sites of utilization in the body is generally different from the pharmaceutical form in which it is administered. However, the commercial product with fillers and stabilizers is the form in which any medication is administered so their effects cannot be ignored. Considering the variety of compounds used as fillers and stabilizers in different pharmaceutical preparations, and the different active and inactive forms of metabolites known to be present in circulation for any given drug, it is impossible to study all of them or to pinpoint the one or more compounds that cause the reduction in AFP value in any assay. A correction for the effect of every known drug and its formulation on AFP by different assay kits would also be impossible. The ideal solution would be to instruct the patient to desist from medications, at least overnight, before giving blood for an MSAFP analysis.

In conclusion, we suggest that clinicians discuss the accuracy and precision of laboratory analysis with their laboratory when confronted with an abnormal MSAFP result. We also suggest that clinicians review the current medication history of the patient before interpreting a low MSAFP value and proceeding with more tests.

# Mexiletine-associated Left Ventricular Dysfunction: A Case Study

---

Steven L. Ballas MD, Kenneth L. Baughman MD,  
Lawrence S.C. Griffith MD and Enrico P. Veltri MD

---

*Dr. Ballas completed his Internal Medicine residency at Sinai Hospital of Baltimore and is now in private practice in Youngstown, OH. Dr. Baughman is Associate Professor of Medicine and Dr. Griffith is Professor of Medicine, The Johns Hopkins University School of Medicine, Baltimore, MD. Dr. Veltri is Director, Division of Cardiology, Department of Medicine, Sinai Hospital of Baltimore, Baltimore, MD. Reprints: Enrico P. Veltri MD, Sinai Hospital of Baltimore, Division of Cardiology, Belvedere at Greenspring Ave., Baltimore, MD 21215.*

---

*Mexiletine is a lidocaine analogue used in the treatment of symptomatic ventricular arrhythmias. However, in selected individuals with baseline diminished left ventricular function, it may possess clinically significant negative inotropic effects.*

---

**M**exiletine, a lidocaine analogue, is effective in the treatment of ventricular arrhythmias.<sup>1,2</sup> While mexiletine has mild negative inotropic effects, several clinical investigations have demonstrated no clinically significant hemodynamic effects from either oral or intravenous administration.<sup>3,4</sup> This report presents a case of severe, reversible, exacerbated left ventricular dysfunction accompanying mexiletine administration.

## Case Report

A fifty-eight-year-old male with remote inferior infarction was referred to the cardiology service for ventricular arrhythmias. Holter monitoring demonstrated runs of nonsustained ventricular tachycardia. Programmed stimulation demonstrated inducible sustained ventricular tachycardia and a gated blood pool scan revealed globally diminished left ventricular function (ejection fraction, 35 percent). Following failure of conventional antiarrhythmic agents, mexiletine was started with subsequent suppression of ventricular arrhythmias. An exercise stress test on mexiletine demonstrated adequate exercise tolerance without ischemia or ventricular arrhythmias; thus, he was discharged on mexiletine. Over the next six months, he developed progressive congestive failure initially responsive to an increase in diuretics, but subsequently refractory to digoxin, diuretics, and vasodilator therapy; this prompted readmission.

Physical examination was remarkable for elevated jugular venous pressure, bibasilar rales, a grade 2/6 mitral regurgitation murmur (old), and S3 gallop. Medications were digoxin (0.25 mg/day), furosemide (80 mg/day), captopril (100 mg/day), topical nitrates (10 mg/day), and mexiletine (300 mg every six hours). Admission chest radiography demonstrated cardiomegaly (car-

diothoracic ratio 21:32) with pulmonary vascular congestion, and electrocardiogram demonstrated normal sinus rhythm with poor R wave progression, and non-specific ST-T wave changes unchanged from previous tracings. Left ventricular ejection fraction was 12 percent as assessed by gated blood pool scan. A ventilation-perfusion lung scan revealed low probability for pulmonary emboli. Exercise stress testing to 70 percent predicted maximum heart rate lacked ischemic changes. Coronary angiography showed total occlusion of the right coronary artery and 60 percent stenosis of the proximal left anterior descending and circumflex arteries. Right ventricular endomyocardial biopsy showed mild fiber loss and hypertrophy without evidence of myocarditis.

It was concluded that the only plausible cause for increasing congestive failure in this patient was mexiletine. Mexiletine was discontinued and amiodarone started. Repeat Holter monitoring demonstrated suppression of ventricular arrhythmias. Gated blood pool scans demonstrated improvement in left ventricular ejection fraction to 29 percent at two months and to 45 percent at one year after discontinuation of mexiletine.

### Discussion

Side effects described with oral administration of mexiletine have been confined to gastrointestinal and neurologic dysfunction. Although intravenous administration of mexiletine has been reported to produce significant hemodynamic effects on myocardial contractility, peripheral vascular resistance, cardiac output, or blood pressure, these effects were clinically insignificant and may have been related to preexisting left ventricular dysfunction or rate of administration.<sup>1,4,5</sup> Kuhn et al<sup>3</sup> demonstrated no significant effects on systemic or pulmonary artery pressures or cardiac output following oral administration.

In contrast to the observations of Stein et al,<sup>4</sup> who found no change in left ventricular ejection fraction after mexiletine administration, we noted a decrease in left ventricular ejection fraction (35 to 12 percent) in this patient. Extensive evaluation failed to demonstrate alternative explanations and subsequent clinical and objective evidence of improvement was noted after discontinuing mexiletine. Although there was concomitant amiodarone therapy, serial gated blood pool scans in patients with left ventricular dysfunction and arrhythmias treated with amiodarone have shown only a slight increase in ejection fraction and thus it would appear unlikely that our patient's marked improvement was due to amiodarone.<sup>6</sup>

Based on these findings, we conclude that the negative inotropic effects of mexiletine may be clinically significant in selected individuals with baseline diminished left ventricular function.

# Proarrhythmia: Disparity of Programmed Electrical Stimulation Results and Spontaneous Occurrence: A Case Report

Angel E. Alicea MD, Enrico P. Veltri MD and Diana Aarons RN

---

From *Sinai Hospital of Baltimore* where Dr. Alicea is a Senior Medical Resident; Dr. Veltri is Director, Division of Cardiology, Department of Medicine; and Ms. Aarons is a Clinical Research Nurse, Sudden Death Prevention Program. Reprints: Enrico P. Veltri MD, Division of Cardiology, (Sinai Hospital), Belvedere at Greenspring Ave, Baltimore, MD 21215.

---

*The disparity noted between programmed ventricular stimulation results and spontaneous occurrence of proarrhythmia suggests that programmed ventricular stimulation may be insensitive in identifying the risk and underlying mechanism of proarrhythmia.*

---

**P**roarrhythmia, defined as the new onset or aggravation of existing arrhythmia, is a known, potentially lethal side effect of virtually all antiarrhythmic drugs currently in use.<sup>1-3</sup> In one series, spontaneous aggravation of arrhythmia was noted with 11 percent of all drugs tested and in 34 percent of patients treated with multiple antiarrhythmic drugs.<sup>3</sup> In another series using programmed ventricular stimulation, proarrhythmia was noted in 16 percent of the drug trials.<sup>4</sup>

Attempts have been made to identify risk factors or clinical predictors of arrhythmia aggravation by antiarrhythmic drug therapy. Patients with left ventricular dysfunction and a history of sustained ventricular tachycardia or ventricular fibrillation have been shown to have a significant increased risk.<sup>5</sup> More recently, an abnormal repolarization response to exercise has been found in patients who develop polymorphous ventricular tachycardia in response to type Ia antiarrhythmic drugs.<sup>6</sup>

We present a case report of a patient with a normal structural heart and good ventricular function who presented with recurrent syncope and inducible, symptomatic, nonsustained ventricular tachycardia suppressed by quinidine, yet in whom a spontaneous proarrhythmic event developed on the same drug hours later.

## Case Report

An eighty-one-year-old white female was admitted for evaluation of recurrent syncope of unknown origin. During the nine months prior to her admission, she experienced four syncopal episodes unrelated to any specific activity or change in posture. There were no associated symptoms of chest pain, dyspnea, palpitations, aura, or incontinence. Previous cardiac and neurologic workups had revealed a normal electroencephalogram (EEG) and computed tomography (CT) scan of the head. Echocardiography and an exercise stress test were normal. Twenty-four-hour Holter monitoring revealed frequent and complex ventricular ectopy, including multifocal forms.

The patient's past medical history was significant for hypertension and vertigo treated with Captopril 12.5 mg by mouth (po) twice a day (bid), and Meclizine 12.5 mg po bid. She denied tobacco or alcohol use.

Physical examination revealed a well-developed, elderly white female in no acute distress. Her blood pressure was 190/80 mm Hg, and her pulse was 80 beats per minute (bpm) with ectopics without orthostatic changes. There were no carotid bruits, good carotid upstrokes, and no jugular venous distension. Lungs were clear to auscultation. Heart examination was significant for a soft II/VI systolic ejection murmur at the aortic base with a I/VI holosystolic murmur at the apex with radiation to the axilla. Distal pulses were normal. Neurologic examination was unremarkable.

Admission blood work was normal. Electrocardiogram revealed normal sinus 75 bpm with left ventricular hypertrophy and nonspecific ST-T wave changes. QTc was 0.40 seconds. Twenty-four-hour Holter monitoring performed off antiarrhythmic drugs revealed frequent ventricular ectopic beats.

The patient underwent electrophysiologic study<sup>7</sup> which revealed normal sinus and atrioventricular (AV) nodal function. Baseline conduction intervals were normal. There was no evidence of distal conduction disease as assessed by atrial stimulation and decremental pacing. Using programmed ventricular stimulation single, double, and triple extrastimuli, as well as ventricular burst pacing, reproducible symptomatic nonsustained ventricular tachycardia (the longest 13 beats) was induced. Following 286 mg of quinidine infusion (5 mg/kg) over twenty minutes, repeat programmed ventricular stimulation using the same stimulation protocol induced a maximum of +1 repetitive ventricular response. QTc following quinidine infusion was 0.60 seconds.

The patient returned to the telemetry ward with a standing order for Quinaglute 324 mg po three times a day (tid). She received the first dose approximately six hours post-infusion and three hours later developed Torsade de Pointes associated with presyncope (Figure). Electrolytes (including potassium and magnesium) were normal. QT was found to be prolonged (QTc = 0.50 seconds) and the quinidine level was 1.8 md/dl. She was transiently placed on lidocaine. Quinaglute was discontinued. Mexiletine was subsequently started, however it was discontinued due to gastrointestinal side effects. Encainide 35 mg po tid was initiated. Repeat programmed ventricular

stimulation revealed no inducible ventricular arrhythmia. Subsequent Holter monitoring revealed suppression of all ventricular ectopy. She has been followed for one year on Encainide therapy and has had no recurrence of syncope.

## Discussion

The disparity of programmed electrical stimulation results and the spontaneous occurrence of a proarrhythmic response in this case draws attention to questions regarding safe antiarrhythmic drug use. What is the mechanism of proarrhythmia? And, how sensitive is programmed electrical stimulation testing in identifying patients at risk of proarrhythmia?

In regard to the first question, abnormal impulse conduction (reentry), abnormal automaticity, and triggered automaticity are mechanisms proposed for spontaneous occurrence of arrhythmias, as well as proarrhythmic response to antiarrhythmic drugs.<sup>1,8</sup> Levine et al proposed that prolongation of the JT component of the QT interval predisposes toward early after-depolarization and, thus, the development of triggered activity at the cellular level.<sup>1</sup> This would manifest clinically as polymorphic ventricular tachycardia or Torsade de Pointes.

Torsade de Pointes is a proarrhythmic response known to occur in patients treated with antiarrhythmic drugs, specifically drugs in type Ia.<sup>9,10</sup> A significantly prolonged QT interval (QTc >0.44) is a prerequisite associated with Torsade de Pointes. In our case, the patient had a normal baseline QTc with a post-infusion QTc of 0.60 seconds, yet without manifest proarrhythmia during or immediately post-infusion of quinidine. Other risk factors associated with proarrhythmic response (such as hypokalemia, concomitant use of digitalis, or atrial fibrillation with variable RR intervals) were not found in our patient, nor was apparent structural heart disease. Furthermore, the proarrhythmic response occurred in the first few hours of therapy (with a subtherapeutic level at the time), suggesting an idiosyncratic response and not dose-dependency.

Regarding the second question, although electrophysiologic studies may be considered the gold standard in testing antiarrhythmic drug efficacy, this testing may be insensitive to proarrhythmia. Horowitz et al showed that electrophysiologic testing could be effective in provoking possible proarrhythmic responses

**Figure.** Continuous electrocardiographic strip (11 seconds between arrows) depicting spontaneous polymorphic ventricular tachycardia three hours following initial oral quinidine dose.

by antiarrhythmic drugs, however no study has analyzed these induced arrhythmias manifesting clinically (i.e., spontaneous proarrhythmia).<sup>4</sup>

The arrhythmia induced in our patient during programmed electrical stimulation was morphologically different from that observed at the time of the spontaneous proarrhythmic event. This observation suggests that these arrhythmias likely occur by different mechanisms, and that drug efficacy assessment by programmed stimulation testing for one mechanism does not exclude proarrhythmia occurring by another mechanism. It has been proposed that programmed stimulation induces arrhythmias governed by a reentry mechanism, albeit the induction of arrhythmia by a triggered activity mechanism cannot be completely excluded. If this were the case, the proarrhythmia noted in our patient would likely have occurred by a triggered mechanism not identifiable by programmed stimulation.

In summary, this case illustrates the need for better methods to identify patients at risk for proarrhythmic responses to antiarrhythmic drugs. Demonstrable efficacy assessment by programmed electrical stimulation does not exclude spontaneous proarrhythmic response. Better understanding of the underlying mechanism by which antiarrhythmic drugs cause proarrhythmia may yield the information necessary to identify these patients prior to the manifestation of potentially life-threatening events.

## Maryland Metabolic Institute Announces Their New Location and Continuation of Services

A new strategy to improve patient care

*We help the physician  
by helping the patient  
help themselves*

**H**ealth can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

Training Programs Include:

### Diabetes Education

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

### Behavior Modification

- weight reduction and maintenance
- modified fasting: Optifast
- limited diets: Optitrim
- full food control: LEARN®
- stress management

### Dietary Counseling

- all medical disorders

### Cancer Immunotherapy, Part II: New Approaches

In the seventies, attempts were made to study and understand tumor immunity at the clinical level. Attention was directed to *in vivo* testing and *in vitro* assays. This produced a large amount of data which unfortunately lacked correlation with the stage of the tumors studied. Two tumors were studied more than any other malignancies, namely, cutaneous melanoma and large bowel cancer.

In 1976, we reported that patients with Dukes' B, C, and even early D adenocarcinoma of the large bowel showed no evidence of general immunosuppression when tested by a variety of tumor non-specific tests.<sup>1</sup> These included: (1) Bacterial, fungal, and viral antigens in delayed hypersensitivity skin reactions to purified protein derivative (PPD), monilia, mumps, varidase, and the allergen dinitrochlorobenzene (DNCB); (2) lymphocyte stimulation assays to three mitogens (phytohemagglutinin, concanavalin-A, and pokeweed) and to four antigens (PPD, monilia, mumps, and varidase); (3) T-lymphocyte and B-cell count by the rosette assays (helper and suppressor T-cell assays were not available at that time); and (4) in contrast, tumor-specific immunity has been noted in response to tumor-associated antigens in large bowel cancer.

Hellstrom and coworkers used colony inhibition assays to demonstrate that the lymphocytes from colorectal cancer patients prevented colony formation.<sup>2</sup> Their work suggested the presence of cross-reactive tumor-associated antigens in colorectal cancer, as well as individual tumor-specific transplantation antigens. Bull, Elias, and Greco have demonstrated specific cell mediated immunity in patients with Dukes' B and C large bowel cancers by the migration inhibition assays using tumor-associated antigens.<sup>3-6</sup> Cell mediated immunity to the tumor was observed before surgery but disappeared shortly after surgery. This tumor immunity could not be demonstrated in patients with Dukes' D disease (i.e., in those with distant metastasis, in patients with other malignancies, or in normal volunteers when their leukocytes were tested with large bowel tumor-associated antigens). Such findings had been confirmed by Shani, using leukocyte adherence inhibition assay.<sup>7</sup> Using monoclonal antibodies, Herlyn and associates have directly demonstrated the presence of tumor-associated antigens in colorectal carcinoma.<sup>8</sup>

These findings highly suggested that adenocarcinomas of the large bowel are immunogenic tumors, and it seemed that the postoperative period was an ideal time to initiate tumor specific immunotherapy in patients who had undergone curative surgery, but had a guarded prognosis (i.e., Dukes' B<sub>2</sub> and C disease). This is because such patients will have low tumor bur-

den at the micro level, and their tumor-specific sensitization would be declining. Active immunization by autologous tumor cells was chosen, as such an approach may lead to prolonged periods of sensitization. In addition, these patients are not immunosuppressed once they recover from the effects of surgery and anesthesia, therefore they can mount an immune response. The results of this approach showed some success in sensitizing these patients, however, three or more vaccinations were required to establish tumor specific sensitization, and it seemed that such sensitization again disappeared over a short period of time.<sup>9-10</sup> Similar findings had been noted in melanoma.

The interest in adoptive immunity was reborn when Rosenberg reported a 20 to 25 percent complete response over a long period of time in patients with widespread metastatic disease treated by Interleukin-2 (IL-2) and Lymphokine Activated Killer (LAK) cells.<sup>11</sup> When large numbers of the patient's peripheral blood lymphocytes are incubated *in vitro* with a high concentration of IL-2 (which is a lymphokine) for a few days, it will produce LAK cells. These are cytotoxic to the autologous tumor and often to other various malignant cells. As a general rule, LAK cells are not toxic to normal tissue. The activity and generation of LAK cells and their precursors, the Natural Killer (NK) cells, were measured preoperatively in patients with gastrointestinal malignancies. Both the generation and activity of LAK and NK cells were reduced in patients with metastatic disease compared with those with local or regional disease.<sup>12</sup> This further confirms our findings with the leukocyte assays.

Recently, it has been shown that the Tumor Infiltrating Lymphocyte (TIL) cells and IL-2 combination were more cytotoxic to the tumors, and they are fifty to one-hundred times more effective. The TIL cells presumably came via the peripheral circulation in the preoperative period. Such information seems to support our previous findings when we used the leukocyte migration inhibition assays.<sup>13</sup>

As a result of the above findings, it seems that better results in cancer immunotherapy can be obtained by a combined approach of adoptive, followed by active, tumor-specific immunotherapy. I strongly believe that IL-2 can be used as an adjuvant to surgery. It should be administered preoperatively while the peripheral lymphocytes are sensitized to the tumor and while TIL cells are present *in vivo* at the tumor. Postoperatively, patients with no distant metastasis should be maintained on IL-2, then shifted to active tumor-specific immunotherapy. Furthermore, patients with resectable distant metastases amenable to surgical extirpation (e.g., patients with liver metastases from large bowel cancer) can be managed

Could Your Practice  
Use a Little

**PEP** ?

### Patient Education Phone Systems

may be the answer. Your telephone is the lifeline to your practice. Each time you put a patient on hold, you're missing an ideal opportunity to educate them about your practice and the procedures you perform. Informed patients are happy patients. Happy patients are your best source of referrals and new business.

With a P.E.P. System in your office, you just press Hold. A custom recording does the rest:

- Tells where you are located.
- Tells when you are open.
- Explains the procedures you perform.
- Enhances your practice image.
- Keeps your patients informed, interested and on the line.

To arrange a demonstration, contact:

**MJD Marketing**  
7605 Leesburg Dr.  
Bethesda, Md. 20817  
1-800-326-4869

**STOP PUTTING YOUR  
PRACTICE ON HOLD**

similarly. Such an approach could yield more effective killer cells, which are more potent than the present LAK and TIL cells, in the adjuvant set up. It is hoped this could give better survival.

# WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, P.I.E. Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. P.I.E. Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

**Physician Managing Boards**, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

**Quality Rated Insurance Program:** a modified claims-made plan which works in the physician's favor to reward loss-free physicians

and provides added protection not available in other policies.

**A Financially Sound Reinsurance Program** with Lloyd's of London, the world's most prestigious reinsurer.

**An Aggressive Defense Team**, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

## THE JOHNS HOPKINS MEDICAL INSTITUTIONS

All courses at the Turner Auditorium unless otherwise indicated. For information on Continuing Medical Education Activities for 1991, contact the Office of Continuing Education, 720 Rutland Ave., Turner Auditorium, Baltimore, MD 21205 (301-955-5880).

June 3-14	<b>The Fourth Annual Summer Institute in Environmental Health Studies.</b> Info: Dr. Jacqueline Corn, 301-955-2609.
June 10-12	<b>Advanced Pediatric Life Support Courses.</b> 20 Cat 1 AMA/PRA credits; 20 AAP PREP credit hours. Fee: \$495. Info: 301-955-2959.
June 13-14	<b>Design and Analysis Issues in Clinical Trials.</b> 14.5 Cat 1 AMA/PRA credits. Fee: to be announced. Info: 301-955-2959.
June 13 - 15	<b>Endoscopic Sinus Surgery: Laboratory and Lecture Series.</b> 25 Cat 1 AMA/PRA credits for laboratory series; 17.5 Cat 1 AMA/PRA credits for lecture series. Fee: \$950 laboratory series; \$295 lecture series. Info: 301-955-2959.
July 29 - August 2	<b>Control of Biohazards in the Research Laboratory.</b> Info: Dr. Byron Tepper, 301-955-5918 or Dr. Jacqueline Corn, 301-955-9334.

### Continuously Throughout the Year

**Visiting Preceptorship in Pediatric Critical Care Medicine.** Ongoing 5-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: \$600. Info: 301-955-2959.

**Ophthalmic Electrophysiology Technician Training Course.** Ongoing 1-week course by appointment. The Wilmer Eye Institute, Baltimore, MD. Info: C. Kearney 301-955-2959.

**Ophthalmology Grand Rounds.** Audiovisual continuing education series of case discussions for clinicians; 3-8 topics per conference. Through June 24, on Mondays, 8:00-10:00 am; beginning July 1, on Thursdays, 7:30-9:00 am. 2 Cat 1 AMA/PRA credits per session. Info: 301-955-5700.

**Neuro-ophthalmology Conference.** Held twice per month. Info: 301-955-5700.

**Cornea Conference.** Held monthly. Info: 301-955-5700.

**The Department of Radiology and Radiological Sciences** offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams 301-955-3169.

**Visiting Physicians.** Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: \$500.

**Johns Hopkins Medical Grand Rounds.** Accredited audiovisual continuing education series of case discussions for clinicians; 30 topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 301-955-3988.

**Microsurgery Training at The Johns Hopkins Hospital.** One-week program offered continuously throughout the year. 40 Cat 1 AMA/PRA credits. Info: P. Williams 301-955-3169.

### *Physician Placement Services*

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

**Physician Placement Service  
1211 Cathedral St., Baltimore, MD 21201-5585  
(301-539-0872)**

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland. **MMJ** announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

## UNIVERSITY OF MARYLAND SCHOOL OF MEDICINE

**CME Courses:** For each course, additional information may be obtained by contacting the Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, MD 21201 (301-328-3956) or by calling the phone number listed after a specific program. FAX 301-328-3103.

June 5	<b>Subspecialty Care in General Practice</b> , at the University Club, Baltimore, MD. 1 Cat 1 AMA/PRA credit per date. Fee: \$50. Info: 301-328-3103.
June 7-8	<b>Current Practical Concepts in Endocrinology and Metabolism</b> , at Harbor Court Hotel, Baltimore, MD. 10 Cat 1 AMA/PRA credits. Fee: \$150.
June 23-28	<b>17th Annual Family Medicine Review Course</b> , at the Carousel Hotel, Ocean City, MD. 20+ Cat 1 AMA/PRA credits; 20+ AAFP prescribed hours. Fee: \$395.
June 27-28	<b>10th Annual Update in Obstetrics and Gynecology</b> , at the Annapolis Waterfront Hotel, Annapolis, MD. 14 Cat 1 AMA/PRA credits; 14 ACOG cognates. Fee: \$225.
June 28-30	<b>Dermatology Days</b> , at the Carousel Hotel, Ocean City, MD. 14 Cat 1 AMA/PRA credits; 14 AAFP prescribed hours. Fee: \$250.
September 6	<b>Current Concepts in Ophthalmology: 11th Annual Clinical Conference</b> , at the Columbia Inn, Columbia, MD. 6 Cat 1 AMA/PRA credits. Fee: \$75.

### Continuously Throughout the Year

**Visiting Professor Program** - A directory of speakers and their topics is available to area hospitals and other health care organizations. NO administrative fees are charged for this service. Info: 301-328-3956.

**Visiting Practitioner Preceptorships** - Opportunities for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Hour-for-hour Cat 1 AMA/PRA credits available. Direct all inquiries to CME 301-328-3956.

**Departmental Rounds and Conferences** - Weekly, hands-on and lecture presentations hosted by the University's clinical departments. Hour-for-hour Cat 1 AMA/PRA credits available. Brochure available.

## Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degrees, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles.

Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both the principal author and **MMJ**.

\* \* \*

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

## MISCELLANEOUS MEETINGS

- June 29** **Lyme Disease Seminar**, at Holy Cross Hospital, Silver Spring, MD. 3 Cat 1 AMA/PRA credits. Fee: \$25. Info: Dr. Wendy Feaga, 301-531-6330.
- August 14-17** **West Virginia Medical Society Annual Meeting**, at The Greenbrier, White Sulphur Springs, WV. Cat 1 AMA/PRA credits available. Fee: \$125 members; \$175 nonmembers. Info: Nancie Divvens, 304-925-0342.
- September 13-14** **Nutrition Support in the Cancer Patient**, sponsored by the Maryland Society for Parenteral Enteral Nutrition, at the Sheraton Inner Harbor Hotel, Baltimore, MD. Cat 1 AMA/PRA credits available. Fee: \$10 members; \$20 nonmembers. Info: B. Pharoan MD, 301-661-9300.

**Shady Grove Adventist Hospital, 9901 Medical Center Drive, Rockville, MD. Info: 301-279-6000.**

- June 6** **Recent Advances and Update in Oral & Maxillofacial Surgery: Dental Implants and Orthognathic Surgery**
- June 13** **Mechanisms and Treatment of Head Injuries**
- June 20** **Update in Pediatric Orthopedic Surgery**
- June 27** **Legal and Business Issues Facing a Growing Practice**
- July 11** **Surgical Management of Mitral and Aortic Valve Disease**
- July 18** **A New Approach to Migraine**
- July 25** **Controversies in Central Venous Catheterization**
- August 1** **Overview of the Norplant System**
- August 15** **HCFA Substandard Care Regulations**
- August 22** **Kidney and Pancreas Transplantation**
- August 29** **AIDS Panel Discussion**

**American College of Emergency Physicians, 1211 Cathedral Street, Baltimore, MD. Info: 301-727-2237.**

- June 6** **Executive Committee Meeting**

### PSYCHIATRIST

Columbia - Busy child/family-oriented practice seeks additional psychiatrist. Send CV to Bob Goshen MD, Suite 207, Medical Arts Building, Columbia, MD 21044 (301-964-9484).

### PHYSICIANS WANTED

Semi-retired or retired physicians for pleasant office practice part-time. Call 547-2686.

### OBSTETRICIANS

Excellent opportunity for OBSTETRICIANS establishing practice. Supplement your private practice with hospital position. Guaranteed income, opportunity for generating additional compensation (i.e., County OB deliveries; Assisting in Surgery and self-collection for walk-in patient deliveries). Excellent location in prestigious Montgomery County. Modern facility with 24-hour anesthesia and pediatric coverage and assistant for surgery. Progressive hospital environment. Call 301-891-5651.

### FAMILY PRACTITIONER WANTED

Full-time physician desired for expanding family practice in Howard County. BE/BC with Maryland license required. Full range of primary care services in new modern facility. Excellent income, full benefits with malpractice insurance. Potential for partnership. Reply to: Box 4.

### PART-TIME PEDIATRIC PRECEPTORS

Sinai Hospital of Baltimore is now hiring part-time Pediatric Preceptors to work in the Emergency Room. For more information, please call Susan Moriarty MD at 578-5737.

### RADIOLOGY PRACTICE

In the Greater Baltimore area, successful and continuously growing Radiology Practice. Parties interested in Partnership and/or other arrangement, please write: Radiologist, 406 W. Pennsylvania Ave., Towson, MD 21204.

### LOCUM TENENS PHYSICIAN

Join a comprehensive physician support service with a major medical center in south central Montana. Locum physicians provide primary care coverage (excluding routine OB) for physicians in rural Montana and Wyoming. Assignments vary in length. Reimbursement for expenses, malpractice, health insurance, CME. Call Locum Tenens Coordinator, 1-800-325-1774 or send CV to 1500 Poly Dr., Suite 103, Billings, MT 59102.

### PRACTICE WANTED

Will buy Int Med/Fam Med Practice in Balt City/Suburbs. Am ABIM certified. Will consider Gastro partnerships, too. Reply Box 6 or call 561-9473 eve/wkends.

### FOR SALE

General practice and office. Catonsville/Woodlawn area. 744-3666.

### OFFICE SPACE FOR RENT

1,050 sq ft new office next to St. Joseph Hospital. 301-337-6800.

## FAMILY PRACTICE/ INTERNAL MEDICINE

### Montgomery County, Maryland

Grow with an established multispecialty group in lucrative thriving metro area. Develop own practice within group and enjoy unlimited income potential. Excellent benefits include paid malpractice. Multi-site positions available at Mt. Airy and Rockville. Reply in confidence to:

Cheryl A. Dolan, Administrator  
Montgomery Medical Group, P.A.  
15235 Shady Grove Road, Suite 103  
Rockville, MD 20850  
or call (301) 417-7270

## BECO MANAGEMENT, INC.

### Medical Suites Available

Montgomery Village Professional Center  
19201 - 19271 Montgomery Village Avenue  
Gaithersburg, Maryland

Southern Medical Building  
9131 Piscataway Road  
Clinton, Maryland

Branch Avenue Medical Arts Building  
3611 Branch Avenue  
Temple Hills, Maryland

White Oak Professional Building  
11161 New Hampshire Avenue  
Silver Spring, Maryland

Garwyn Medical Center  
2300 Garrison Boulevard  
Baltimore, Maryland

Randallstown Medical Center  
5310 Old Court Road  
Across from the Baltimore County General Hospital

BECO Management, Inc. owns and manages all of these top quality medical office facilities.

BECO Management, Inc. knows what the medical professional demands and guarantees professional, responsive service to all of our valued clientele.

For further information contact:  
Marc Bellet (301) 681-3550

**OFFICE SPACE TO SHARE**

Available May 1991. Relatively small but efficient office (900 sq ft) in new St. Joseph's Professional Bldg, Towson. Rent negotiable. Call 337-7097.

**OWINGS MILLS OFFICE TO SHARE**

Growing internal medicine practice wishes to sublease space in new office. New office to open July 1, 1991. Layout input still possible. Receptionist and medical assistance also possible. For information, call Scott Rifkin MD 356-6504 or write 2 Park Center Court, McDonough Crossroads, Owings Mills, MD 21117

**OFFICE SPACE**

Attractive office space available to share with an established practice. Affordable rent, full exam and x-ray facilities within the office and reception staff. Located in Lutherville, convenient from the Beltway. Contact Kim Kitson at 301-296-1255.

**MEDICAL OFFICE FOR SALE OR SUBLEASE**

Brand new office located in Professional Center in Ellicott City. 912 sq ft. 2 exam rm. All equipment included. Call 461-7078.

**MEDICAL OFFICE**

Suitable for 1 or 2 physicians: St Mary's County, a rapidly growing semirural area. Contact Leon Berube for details, 997 Old Route 5, Mechanicsville, MD 20659 (301-884-3113).

**OFFICE SPACE**

Available for sublet in the Pikesville area. Morning and afternoon hours available. Please contact 484-5238.

**MEDICAL-SURGEON'S OFFICE TO SHARE**

Pikesville: office with private consultation room to sublease, full- or part-time; x-ray and lab available. Parking lot; near Metro stop & public transportation. 301-484-8066 except Tuesday.

**OFFICE SPACE**

Medical office to sublet in Perry Hall. Excellent space. 900 sq ft in medical building in growing area. Call 529-6440.

**MEDICAL OFFICE FOR SALE OR LEASE**

2000 sq ft in excellent location near Cross Keys in medical office building. Very convenient to most major hospitals. Contact Rick Tucker at 727-8347.

**NEEDED**

Busy ENT looking for new location/expansion? 800-900 sq ft or larger office space available for rent, busy medical building, Rockville, MD, with referring primary care physicians, no ENT in building or in close area. Call 301-230-0300.

**MEDICAL OFFICE SUITE FOR LEASE**

Osler Medical Center, Towson; near St. Joseph Hospital, GBMC, & Sheppard Pratt Hospital. Info: R.R. Kent MD, 301-323-5831 or 301-461-9922.

**MMJ  
Classified Advertising**

*Med Chi Members:  
\$5 per line per insertion*

*Physician Nonmembers:  
\$8 per line, minimum \$50 per ad*

Please submit copy seven weeks prior to the first day of the month in which you wish the ad to run. Items must be related to the practice of medicine. Ads placed for the benefit of a hospital or an HMO will be billed at the nonmember rate. Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physician's practice or equipment.

Send ad replies or new ad copy to: **MMJ**, 1211 Cathedral St., Baltimore, MD 21201 or FAX 301-547-0915. Invoices are sent after the ad is published.

**EQUIPMENT FOR SALE**

Reflotron machine for sale. Used very little, in excellent condition. For more information, call 242-6220.

**PROFESSIONAL RESUME SERVICES**

Successfully serving physicians since 1976. All specialties. Effective! Confidential. We provide curriculum vitae preparation, cover letter development and career planning. Immediate service available. Call 1-800-933-7598 (24 hrs). Alan Kirschen, M.A. ■

*Court Yard; Signage; Option of On-Site Radiology and On-Site Laboratory*

**40% Preleased!**

For more information and a personal tour, please call Dr. Robert Marine or Susan Best 2525 Riva Road, Annapolis, Maryland 21401 (301) 269-7992 Balt./ (301) 858-5035 Wash.

## FOR SALE

Owning your own medical office offers the following advantages:

- Avoid Rent Escalation
- Guarantee Your Practice Location
- Pay Less Personal Taxes
- Build Equity In Real Estate

## ANNOUNCING

A new 45,000 square foot Medical Office Condominium

## ESSEX COMMUNITY MEDICAL CENTER

Superbly located across from Franklin Square Hospital Center

**Call: Amtrade International (301) 391-3080, FAX (301) 653-5093**

## FULL TIME EMERGENCY PHYSICIAN

Large, urban emergency department seeing 50,000 patients per year in teaching hospital. Excellent salary and benefits.

Please contact:

Anne Salmon Barone, Ph.D., M.D.  
or Dr. Jerome Snyder  
St. Agnes Hospital  
900 S. Caton Avenue  
Baltimore, MD 21229  
(301) 368-2012 or  
(301) 368-2000

## EMERGENCY PHYSICIANS

Well established, successful, independent fee-for-service group, based in a modern suburban community hospital, seeks career-oriented emergency physicians. Part-Time. Primary responsibility for patients on "fast track" and assist full-time physicians with more acute, complex patients as needed. Bonus incentives and flexible schedule. Close to Annapolis and ocean communities. Board prepared in EM or related field. Available immediately.

Please contact and send CV to:

Walter L. Scheetz, MD, Director  
Emergency Medicine Department  
North Arundel Hospital  
301 Hospital Drive  
Glen Burnie, MD 21061  
(301) 787-4571/4572

## THE BENEFITS ARE CLEAR...

Our new Philips 1.5 T magnet means superior MR images. The Gyroscan S15 Advanced Clinical System offers the highest resolution possible. And we offer 3-D MRI reconstruction to give you even greater diagnostic confidence. Our board certified radiologists are trained in advanced MRI technology to provide you with the highest degree of accuracy. Your patients will appreciate the increased comfort of the wider table, improved lighting and faster scan times.

This state-of-the-art Philips system is just a part of the advanced integrated diagnostic imaging services we provide. To get the whole picture, call us.

*"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."*

Theodore C. Patterson, M.D., Medical Director,  
Meridian Nursing Center—Heritage

#### **Partners in Healthcare**

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dietitians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—  
The Professional Choice.

# Competition, HMOs, Insurance and slow-paying patients... it's enough to make you sick.

THE PROBLEMS OF MANAGING A PRACTICE TODAY CAN REALLY MAKE YOU SICK.

EVEN WORSE, THEY CAN MAKE THE BUSINESS END OF YOUR PRACTICE SICK, TOO. THAT'S WHERE WE CAN HELP.

WE'RE CBSI, THE LEADER IN MEDICAL OFFICE AUTOMATION SYSTEMS SINCE 1977. OUR PHYSICIAN INFORMATION SYSTEM SUBMITS YOUR INSURANCE FORMS ELECTRONICALLY, POSTS PAYMENTS AND ADJUSTMENTS AUTOMATICALLY, AND RUSHES YOU COMPLETE, UP-TO-THE-MINUTE PATIENT CLINICAL AND FINANCIAL DATA. CURRENTLY RELIED UPON BY MORE THAN

**ALPHA MICROSYSTEMS**  
RIGHT FROM THE START.

5,000 PHYSICIANS IN OVER 50 MEDICAL SPECIALTIES AROUND THE AREA. MORE THAN 99% OF THESE SYSTEMS ARE STILL IN USE TODAY BECAUSE THEY'RE FLEXIBLE, ADAPTABLE AND CBSI BACKS THEM WITH UNPARALLELED HARDWARE MAINTENANCE, CUSTOMER SUPPORT AND TRAINING.

SINCE 1981, CBSI CONTINUES TO BE THE ONLY PROVIDER OF MEDICAL OFFICE AUTOMATION ENDORSED BY THE MEDICAL

SOCIETY OF THE DISTRICT OF COLUMBIA.

PHYSICIAN INFORMATION SYSTEM HELPS MANAGE YOUR PRACTICE, WHILE YOU MANAGE YOUR PATIENTS.

# Why buy an office automation system that doesn't offer a long-term solution?

## ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

### **IBM® and compatible hardware.**

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

### **Long-term support.**

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people

are always there to make sure your system fits your needs over the years to come.

### **Easy to operate.**

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

## It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

*Lumbar Spine*

*Marcos Tepper MD* has been named Medical Director of the new Radiation Oncology Center, which is affiliated with Baltimore County General Hospital (BCGH). A consultant in Radiation Oncology at BCGH since 1986, Dr. Tepper is a Clinical Assistant Professor in Radiation Oncology at the University of Maryland in Baltimore.

Before assuming his present position, he was head of the Division of Radiation Oncology at Sinai Hospital.

After completing medical school, Dr. Tepper served a rotating internship at Mercy-Douglass Hospital in Philadelphia, and was awarded a Radiation Therapy Fellowship at Yale University School of Medicine.

He is a member of the American Board of Radiology in Therapeutic Radiology and the American Board of Nuclear Medicine. Among his numerous medical society affiliations are the American College of Radiology, the American Society of Radiation Oncologists, and the Society of Nuclear Medicine.

Photo courtesy of Crown Portraits, Inc.

*Harvey L.P. Resnik MD*, a psychiatrist specializing in depression, was recently presented with a medal as an "Officer of the Order of King Leopold for service rendered on health matters" by the Belgian Ambassador. Dr. Resnik earned this honor by serving as a NATO Fellow in Brussels, where he studied the psychological aspects of disasters, specifically the

nuclear catastrophe at Chernobyl, and for assisting the Catholic University of Louvain to establish a new clinic to aid people who suffer from dislocation and emotional stress or substance abuse.

A prolific author (ten books, twenty book chapters, and more than thirty articles), Dr. Resnik has held academic appointments at the State University of New York at Buffalo, the George Washington University, The Johns Hopkins University, the Uniformed Services University of the Health Sciences, and the Univer-

sity of Leuven School of Medicine in Belgium. He has also served as a consultant to numerous health-related businesses, as well as American and international agencies - including the White House, the National Institute of Mental Health, and the Belgian Ministry of Health.

A Phi Beta Kappa, Dr. Resnik is a graduate of the University of Buffalo and Columbia University, and is an active member of myriad committees, councils and societies. In addition to his most recent decoration, he is a recipient of more than fifteen honors and awards.

*Henry P. Laughlin MD, ScD, ScSD*, a psychiatrist from Frederick County, MD, was recently awarded a citation from Governor William Donald Schaefer in recognition of his "outstanding service and distinguished leadership on behalf of your State and Nation... in honor of your significant contributions to the unique volunteer public service organization, CAMPER (Catoctin Area Mountain Environmental Resource), as one of the founders and original members of the Board of Directors; and as an expression of our admiration, gratitude and great respect for your long career as a dedicated civic leader..." Dr. Laughlin served three terms as President of CAMPER from 1987 to 1990. CAMPER is the four state volunteer group for Catoctin Mountain Park, site of Camp David.

Author of a score of books, he was the founder and first president of both the American College of Psychiatrists and the American College of Psychoanalysts. Currently the Associate Editor for both the *Maryland Medical Journal* and the *Physician's Practice Digest*, he has been active in the Medical and Chirurgical Faculty of Maryland since 1951, serving on numerous committees, as well as being a member of the House of Delegates and Council. A past President of both the Montgomery and Frederick County Medical Societies, he was also Vice President of Med Chi from 1964 to 1965.

Winner of countless awards and honors, Dr. Laughlin has been a Visiting Professor to sixty medical centers in the United States and overseas, as well as serving as a consultant to fourteen US agencies.

# EPIDEMIOLOGY & DISEASE CONTROL PROGRAM

201 W. Preston Street, Baltimore, Maryland 21201 (301)225-6700

July 1991.

## SELECTED COMMUNICABLE DISEASES IN MARYLAND IN 1990

This report briefly describes the epidemiology of selected communicable diseases in Maryland in 1990, reported by physicians, other health professionals, local health departments, hospitals, and laboratories. For many diseases, additional information was obtained from the case investigations done by communicable diseases coordinators in the local health departments and by hospital infection control practitioners.

The number in parenthesis after the name of each disease indicates the number of reported cases in Maryland with onset of illness in 1990. Below the disease name are the incidence rates in Maryland and the United States, both based on the 1990 census population. The cumulative number of cases reported to the Morbidity and Mortality Weekly Report (MMWR) system in 1990 (CDC. MMWR 1991, Vol. 39, Nos. 51 & 52) were used for the U.S. rate.

Changes in the Code of Maryland (COMAR) Regulations 10.06.01 Communicable Diseases, adopted effective August 7, 1989, affected several reportable diseases and conditions. Four diseases were added to the previous list: delta hepatitis, *Haemophilus influenzae* type B invasive disease (previously only *H. influenzae* meningitis was reportable), symptomatic human immunodeficiency virus infection (previously only AIDS was reportable) and Lyme disease. *Salmonella typhi* carrier became a separate category. Ten diseases were deleted: chickenpox, Guillain-Barre syndrome, staphylococcal and other infections in newborn (newborn septicemia is still reportable), influenza, relapsing fever, Reye's syndrome, smallpox, streptococcal infections (including scarlet fever), typhus and yellow fever. Even though *Campylobacter* infections, giardiasis, Guillain-Barre syndrome, listeriosis, non-cholera

*Vibrio* infections (non-01) and yersiniosis are not on the list of notifiable diseases, reports we received are included in Table 2.

Laboratory surveillance included attempts to investigate patients who had test results indicating a reportable disease but who had not been reported by a physician or hospital. This added to the number of cases of *H. influenzae* disease, viral hepatitis, legionellosis, Lyme disease, meningococcal disease, mycobacteriosis, salmonellosis and shigellosis.

Death certificates that listed reportable diseases as a cause of death were investigated, and cases were counted if confirmed by investigation.

Reportable diseases data are entered into the computer-based Maryland Electronic Reporting and Surveillance System (MERSS) and electronically transmitted to the CDC weekly for our report to the MMWR. Also, our comprehensive code system for general and disease specific variables of epidemiologic and control measure importance, allows for fast and more meaningful analysis of the data.

The completeness and accuracy of the reportable diseases depend on timely reporting from health care providers and laboratories. We are grateful for the cooperation of all those who contributed to the public health in Maryland and in the U.S. by reporting, investigating and controlling the spread of communicable diseases in 1990.

### BOTULISM, INFANT (7)

0.1/100,000 (U.S. 0.2/100,000)

Infant botulism was reported in January (1), February (1), April (1), August (1) and October (3)

from 6 counties (Table 2). The age of the cases ranged from 1 to 5 months (mean 2.6, median 3 months). Six patients were white and one was Hispanic. The male to female ratio was 3:4.

All infants required hospitalization for varied symptoms: constipation, anorexia, dysphagia, hypotonia, lethargy, respiratory insufficiency and paralysis. In six cases, the diagnosis was established by identifying botulinum toxin (type B) in the stool, and one case had an electromyograph (EMG) consistent with botulism (stool was not tested for *Clostridium botulinum* toxin). All of the infants were treated and survived.

Thorough investigation of lifetime food history, other possible exposures, and microbiological examination for *C. botulinum* and/or for *C. botulinum* toxin of miscellaneous available food that had been consumed (apple juice, prune juice, commercial infant formulas and cereals, and honey) failed to disclose the sources of infection. No common factors were found among the three cases with onset in October.

## ENCEPHALITIS, PRIMARY AND POSTINFECTIOUS (27)

0.6/100,000 (U.S. 0.5/100,000)

The number of cases by county is shown in Table 1. Dorchester (4 cases) and Talbot (2 cases) had the highest rates per 100,000 in the State (13.2 and 6.5, respectively). More than half of the patients (52.0%) had onset of illness in July, August and September with peak incidence (6 cases) in July. The ages ranged from 3 to 85 years (mean 41 years). The male to female ratio was 1.1:1.0; the ratio of whites to nonwhites was 2.9:1.0. The following infectious agents caused or were suspected to have caused encephalitis or meningoencephalitis: Herpes simplex or H. zoster (9 cases, including one post-chickenpox case), *Listeria monocytogenes* (1), and *Haemophilus aphrophilus* (1). No cause was identified for the rest of the cases. Six patients died for a case fatality rate of 22.2%.

## GONOCOCCAL INFECTIONS (23,446)

501/100,000 (U.S. 296/100,000)

Reported gonococcal infections increased over the number in 1989 (23,194) (Figure 1). The cases by county are shown in Table 1. Five jurisdictions reported the highest rates per 100,000 population: Baltimore City (1755.2), Dorchester (835.6), Prince

Figure 1

George's (807.8), Somerset (563.5) and Wicomico (543.2) counties. In the past decade Maryland's lowest rate (452.7) was noted in 1988 and the highest rate (765.4) in 1982.

The age distribution of the cases was similar to that in 1989: 26 percent were 15 to 19, 28 percent were 20 to 24, 18 percent were 25 to 29, 11 percent were 30 to 34 years of age. Rates per 100,000 population by age group and sex are shown in Figure 2. In 1990, among the 10,150 cases for whom race was reported, 94 percent of all males and 89 percent of all females with gonorrhea were black. The PPNG (penicillinase - producing *Neisseria gonorrhoeae*) increased by 24 percent, from 10.4 percent of all isolates in 1989 to 12.7 percent in 1990. (Figure 1).

Figure 2

To be continued August, 1991

Table 1. MARYLAND STATE DEPARTMENT OF HEALTH AND MENTAL HYGIENE

# Meet the new team in town.

Maryland General Hospital of Baltimore has teamed up with Bryn Mawr Rehab of Malvern, Pennsylvania, one of the premier physical medicine and rehabilitation facilities in the country to form *Maryland General-Bryn Mawr Rehab Center*.

The new center, staffed by 50 of the finest rehab physicians, therapists, nurses and clinical specialists in the area, will offer the highest quality, comprehensive inpatient and outpatient rehabilitation services.

*Maryland General-Bryn Mawr Rehab Center* features 33 inpatient rehab beds with 15 devoted

to brain injured patients and 18 designated for orthopedic and neurological rehabilitation. Outpatient services are available at the Maryland General Campus in Baltimore and at our satellite health care centers in the neighboring communities of Catonsville and Timonium.

We invite you to meet the new team in town. Call Mary Filippelli, our Administrative Director at (301) 225-8380 to get all the details and to arrange for a tour of our new facility.

*Maryland General-Bryn Mawr Rehab Center*. When it comes to rehab care, we're strictly major league.

MARYLAND GENERAL

# You Will Affect the Future of Medicine

## The Medical Manager® can affect the future of your practice.

The nation's #1 selling software (more than 10,000 systems installed nationwide) helps you in numerous ways.

- ◆ Filing claims electronically means you get payment faster.
- ◆ Increases staff efficiency.
- ◆ You have automated recall notices.
- ◆ Patient demographic data can help your practice grow.

The Medical Manager® is available for as little as \$250. per month on a lease/purchase option.

Call and we'll come to your office, review your needs, and prepare purchase and lease estimates with NO OBLIGATION. Once we install The Medical Manager®, we'll train your staff and provide *on-going support* when you need it.

July 1991

## 1991 Semiannual Meeting

Med Chi's Semiannual Meeting will be held Friday, Saturday and Sunday, September 13, 14 and 15, at the Carousel Hotel and Resort on the beach at 118th Street in Ocean City, Maryland. U.S. Surgeon General Antonia Novello MD will be the special guest speaker. AMA Trustee Robert McAfee is also invited to attend the meeting. In addition, Med Chi physicians will discuss several important medical issues including:

- Practice protocols for physicians with HIV,
- Radiation technologist regulations, and
- Accreditation for mammography screening.

All preregistrants are guaranteed a room with an oceanfront view at a reduced rate. For room reservations, call the Carousel Hotel at 301-524-1000. Please specify that you are registering for the Med Chi Semiannual Meeting.

Physicians are encouraged to complete the preregistration form below.

**REGISTRATION FORM**  
Med Chi Semiannual Meeting / September 13-15, 1991

For additional information, call 539-0872 from the Baltimore area  
or 1-800-492-1056 from elsewhere in Maryland.

## Medicare Secondary Payer Guidelines

In certain situations, Medicare is not the primary insurer for Medicare beneficiaries. Some of these situations are:

### Working Aged

The Medicare beneficiary (65 or older) or his/her spouse (any age) is employed with an employer group health plan of 20 or more employees. (Effective 1/1/83)

### Disability

The Medicare beneficiary (under 65) or a family member is employed with a large group health plan of 100 or more employees. (Effective 1/1/87)

### Workers Compensation

The Medicare beneficiary (any age) is involved in a work-related injury. The workers' compensation carrier should be billed for work-related injuries.

### Automobile Accident

The Medicare beneficiary (any age) is involved in an automobile accident. Bill

the automobile insurance company for automobile accident injuries first, then bill Medicare for secondary benefits.

If you determine that a claim has been denied improperly because a Medicare beneficiary has retired and/or group health insurance offered by a former employer has terminated, you should submit an Information Request Form supplying that information to: The Medicare Secondary Payer Department, 1946 Greenspring Drive, Timonium, Maryland 21093

---

## *Medicare Promotes Correct Coding of Physician Services*

---

Med Chi has asked HCFA for input regarding various aspects of the new Medicare regulations. Med Chi is pleased that HCFA's Regional Administrator, Maurice Hartman, has developed the following which is provided for your information:

The new Medicare physician fee schedule, which replaces the reasonable charge mechanism in place since 1966, is just around the corner! While the effective date is January 1, 1992, HCFA has already taken certain measures to standardize the way payments are processed by the 34 Medicare carriers around the country.

One practice in need of standardization involves the variations in Health Care Procedure Coding System (HCPCS) coding used to bill identical services. This was particularly true for surgical services. A common billing error found was the reporting of two codes when one of the codes actually encompassed the full scope of the services provided. Another problem was reporting two or more codes, when there was already a single code that combined all of the procedures. Medicare does not make separate payments for procedures that are components of a more comprehensive group of services.

Carriers are required by regulation to insure that claims are paid appropriately and, if errors are later found, to take appropriate corrective measures. Therefore, in order to insure correct coding, computerized edits were instituted at all Medicare carriers during February 1991 to identify billings that do not conform to the new requirements.

As an example, one of the edits currently in place will deny code 29870 (Arthroscopy, knee, diagnostic, with or without synovial biopsy) when billed in conjunction with code 29875 (Arthroscopy, knee, surgical; for infections, lavage and drainage synovectomy, limited). Carriers sent educational bulletins in January to notify physicians of the specific codes which will be rebundled into a more comprehensive code when billed for the same patient on the same date of service. When incorrect combinations of codes are billed to Medicare, payment will be made only for the more comprehensive procedure. Payment will be denied for the other code or codes.

The initial edits are working smoothly. A second set of code edits, possibly as many as 500 edits, will become effective in early summer. These edits are being developed in consultation with the AMA and specialty societies.

Before the second edits are in place, Medicare carriers will again send a list to physicians of the correct codes and those which will be denied. The carriers will examine a sample of past claims before the coding changes are implemented. Those physicians who have a high volume of incorrectly coded claims will be contacted by the carrier.

If you should receive a notice of improper billing, you may want to first check that the problem was not the result of a keying error, either on your part or on the part of the carrier. If it is, the carrier should be contacted. If not, then check the CPT-4 book or the carrier's bulletin to see if in fact a single code does fully and completely describe the actual services performed. Carriers are available to work with you to resolve any problems or concerns in specific situations.

The standardization of correct coding procedures will not only insure uniform Medicare payment amounts in the present, but will also allow the development of an equitable fee schedule for the future.

Maurice Hartman  
Regional Administrator  
Health Care Financing Administration

---

## *DEMPAQ*

---

Under a Congressional mandate to extend PRO (professional review organization) review to physician offices, the Health Care Financing Administration (HCFA) has contracted with Delmarva, the Maryland PRO to develop, test, and evaluate

several different review methods before they are carried out on a national scale. By testing the feasibility of reviewing the care received by Medicare patients in physicians' offices prior to widespread implementation of a review program, the federal government is giving physicians an opportunity to contribute to the development of a potentially important review tool. For additional information on DEMPAQ (Development and Evaluation of Methods to Promote Ambulatory Care Quality), see the August 1991 issue of the *MMJ*.

The DEMPAQ project coordinators at Harvard University have provided the following information which emphasizes education and feedback to physicians and concentrates on the quality of care rendered in office settings. Physicians will receive confidential feedback as to how their practice patterns compare to those of their peers. They will also have the chance to evaluate the usefulness and value of the review, and to offer suggestions on how to revise and improve both the review instrument and the review process.

DEMPAQ researchers at the Harvard School of Public Health, The Johns Hopkins University, and the Park Nicollet Foundation are developing the methods to provide the feedback: a medical record review and a claims profiling instrument. The record review includes appraisals of record documentation adequacy and of clinical performance. The claims profiling part of the project uses HCFA-1500 Part B data to prepare profiles of clinical interest to physicians.

Consultants have been recruited from several Maryland groups including Dr. Robert Ruderman from Med Chi, Dr. Joseph Zebley from the Maryland Academy of Family Practice, and Dr. Park Espenschade from the Maryland Society of Internal Medicine.

Beginning in July, letters will be mailed to a random sample of Maryland physicians inviting them to participate in the project. Participating physicians will be asked to provide a randomly selected sample of approximately 25 patient records to DEMPAQ for review. All information submitted will be strictly confidential and will be reviewed by project staff only. To cover the costs of processing and mailing the records, a payment for each photocopied record will be offered.

Results of the Maryland pilot will be carefully studied and used to revise the criteria so that they provide practical and useful feedback to physicians on their practices. The researchers anticipate completing this revision prior to initiating the record review in two other states in the winter of 1991-1992. Claims profiles will be developed and released in mid-1992, first in Maryland and then later in Iowa and Alabama. The project's final report will be available in the fall of 1993.

---

## *Licensure Renewal*

---

The Board of Physician Quality Assurance will be mailing out licensure renewal forms to physicians with last names beginning with M-Z on or about June 30, 1991. The packets will include the standard Part A and a new Part B. Both forms are to be completed and returned to the Board by September 30, 1991 for processing.

The new Part B form is the result of a cooperative effort with the Maryland Health Resources Planning Commission. The information collected will assist the Commission in creating a statewide data base that will assist in manpower and primary care resource planning. Timely completion of these forms will avoid the necessity of enforcing compliance through regulations.

---

## *Medical Mutual Seminar Offers 5% Premium Discount*

---

Medical Mutual has announced it will offer its subscribers a 5 percent discount on their 1992 Medical Mutual renewal premium for attending "Medical Records: Charting a Course for the 90s." This seminar, which is designed to provide physicians with a basis for quality assurance within the medical practice, covers both basic and legal principles of recordkeeping and offers practical applications for risk management. Med Chi is cosponsoring the course which is designated for 3 credit hours in Category 1 of the Physician's Recognition Award of the AMA. The seminar will be given through September and sessions will be held at Medical Mutual, Med Chi, and a number of other locations around the State. Each seminar

runs from 5:00-9:00 p.m. Registration and a light supper begin at 5:00 and the seminar starts at 5:30 p.m. The fee for the seminar is \$40.00 per person. For more information, please call Natalie Harper or Roz Laakso at Medical Mutual at 301-785-0050 or 1-800-492-0193.

Physician Health*

---

Med Chi's Physician Rehabilitation Committee and the Committee on Alcoholism and Chemical Dependency are planning a Second Annual Conference on Addiction and Physician Health for Saturday, November 16, 1991 at the Med Chi Faculty Building. Topics for the conference are slated to include helping your patients stop smoking, recognizing the role of the primary care physician in the treatment of chemical dependence, and using traditional addiction approaches in the treatment of eating disorders. The conference is scheduled to fulfill eight category 1 CME credits. Watch the *MMJ* for registration forms and more information about this upcoming program.

---

*Physician's  
Practice Digest*

---

The summer 1991 issue of the *Physician's Practice Digest* is scheduled to be released July 1, 1991. This issue will focus on HMOs in Maryland and will contain a recap of the 1991 legislative session. For more information on the publication, contact Michelle Burke, Director of Communications at 301-539-0872 or 1-800-492-1056.

---

*Protocol for  
Physicians with  
HIV*

---

Recently, Governor William Donald Schaefer signed Senate Bill 203 requiring that, "The Medical and Chirurgical Faculty of Maryland, in consultation with the Centers for Disease Control, the Maryland Hospital Association (MHA), and the Department of Health and Mental Hygiene, shall develop a practice protocol for physicians who are infected with HIV." The Med Chi Committee on AIDS, in conjunction with the AIDS Administration and the MHA, is currently developing a draft protocol for HIV-infected physicians. A hearing for physicians wishing to comment on the draft protocol will be held July-August, 1991 (dates to be announced). If you are interested in attending these meetings, please contact Betsy Newman, Public Relations Director, at 301-539-0872 or 1-800-492-1056.

  
Angelo J. Troisi, F.A.C.H.E.  
Executive Director

# P.I.E.'s quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. P.I.E. Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

## **QRP FACTS:**

**Strict Underwriting Criteria** — Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

## **Scheduled Premium Reductions** —

Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

**High Limits** — Backed by our reinsurer, Lloyd's of London, P.I.E. is able to offer higher coverage limits for qualifying doctors: up to

\$7 million for individual doctors and \$13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

**Designed With Input from Doctors** — P.I.E.'s QRP plan is an innovative modified claims-made insurance specially designed with input from P.I.E.-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your P.I.E. representative, or our headquarters office today.

# Henry N. Wagner Jr. MD: Winner of the American Medical Association's Scientific Achievement Award

Michelle Burke MHSA and Betsy Newman

*Ms. Burke is Director of Communications and Ms. Newman is Public Relations Director, Medical and Chirurgical Faculty of Maryland, Baltimore, MD.*

In a recent interview, Dr. Wagner responded to questions about his background and activities in his specialty area, nuclear medicine.

---

*"The only effective defense against nuclear weapons lies within the human mind. Perhaps, by studying the workings of the mind, biology can help us save ourselves."*

---

*Interviewer:* What has been your reaction to being chosen for the American Medical Association's (AMA's) Scientific Achievement Award?

*Wagner:* I am delighted. I particularly value the award because it was given by the AMA -- by people who are in the front lines of the practice of medicine. It is wonderful to think that procedures we have developed and things we have learned are helping patients. I am proud to receive the award in the name of so many colleagues with whom I have worked for decades.

*Interviewer:* What do you think about the future of nuclear medicine? How are you planning for that future?

*Wagner:* Nuclear medicine still has the excitement of a new specialty, since it was only accepted as a medical specialty in 1971. In essence, the field deals with molecular medicine -- that is, the chemistry of the body in health and disease. For example, it is concerned with the relationship between behavior and brain chemistry, and the effects of drugs on diseases such as brain tumors and mental illness. We use radioactive tracers to measure the site and rate of chemical processes in every organ of the body. The future of the field is excellent. We have the unique ability to see our own atoms and molecules in action.

*Interviewer:* How has the field changed since it started?

*Wagner:* Right after World War II, radioactive carbon-14 and tritium were released for use in biomedical research, leading to the development of biochemistry as we know it today. However, these two tracers can be used to study only body fluids and experimental animals. Today, we have developed other radioactive atoms (carbon-11, fluorine-18, iodine-123, and technetium-99m) which make it possible to study the chemistry of body organs in living

human beings. The two techniques of positron emission tomography (PET) and single photon emission computed tomography (SPECT) are developing at a logarithmic rate of growth; they provide new radioactive molecules with which we can better explore living chemistry. These radioactive tracers can be thought of as *in vivo* molecular probes.

*Interviewer:* How did you end up in the field of nuclear medicine?

*Wagner:* I got into the field when it was just beginning. A lot of my professors and colleagues advised me not to do so, but I am very glad I did. When I entered the field in 1958, nuclear medicine was in its infancy, but it has grown steadily since then. In those early days, we had to make our own radioactive tracer molecules, but now industry is heavily involved in the development of radiopharmaceuticals and complex imaging instruments. Cyclotrons are becoming widespread in medicine throughout the world.

I am a strong believer in the role of chance in one's life. Literally, the flip of a coin headed me in the direction of nuclear medicine. While I was working at the National Institutes of Health (NIH) in 1956 and 1957, A. McGehee Harvey, Chairman of Medicine, selected Wilbur Madison and me to be Chief Residents on the Osler Medical Service. He told us we could decide who

Dr. Wagner, along with DC Sabiston Jr. and JG McAfee, developed the first lung scanning procedure for diagnosis of pulmonary embolism.

would go first. Wilbur won the toss, so I went to England for a year. While there, I saw for the first time how studies with radioactive tracers could provide information that could help solve the problems of many of the patients I had seen up to that time. When I returned to Johns Hopkins in 1958, I began to carry out liver scans of patients with cancer and other diseases of the liver during my period as a Chief Resident in Medicine. I then joined John McAfee in establishing the Division of Nuclear Medicine at Hopkins in 1959.

A.M. Harvey M.D. (above) greatly influenced Dr. Wagner and taught him the importance of the patient as a person.

*Interviewer:* Is there anyone in particular who has influenced you and your research?

*Wagner:* When I was an undergraduate, I worked for the late Dr. Curt Richter in the Department of Psychiatry at Hopkins. He showed me what tremendous fun it was to carry out biomedical research. Although he and Dr. Horsley Gantt taught no formal courses, they were both selected during the twenty-fifth reunion of my medical student class to be with us, because they had been the most effective teachers. Of course, I was also greatly influenced by Professor A.M. Harvey who taught me the importance of the patient as a person, and the importance of detailed examination of the patient and analysis of all the data related to his or her illness. Alfred Blalock, Chairman of the Department of Surgery when I was a student, also inspired me to enter

Dr. Wagner's trainees at The Johns Hopkins Nuclear Medicine Division include renowned specialists from around the world. Pictured above are Japanese Alumni.

academic medicine as a career, rather than going into private practice.

*Interviewer:* When did you first decide to become a physician?

*Wagner:* I grew up near Bon Secours Hospital in Baltimore and was familiar with how doctors and nurses helped people. In my second year at Calvert Hall High School, I broke my arm while roller-skating and showing off with a neighborhood girl. I was so impressed with my care that I decided to try to become a doctor. I also was influenced by reading a lot of "doctor books" such as those by Paul DeKruif. I could walk to the downtown Enoch Pratt Library from our house in west Baltimore.

*Interviewer:* What has been your greatest satisfaction during your career?

*Wagner:* Like any teacher, my greatest joy is seeing the accomplishments of former students. Many leaders of American and international nuclear medicine have studied at Hopkins, and I am very proud of them and their accomplishments. For example, over sixty Japanese have studied nuclear medicine here. The first three to train in nuclear medicine at Hopkins have become Department Chairmen at Tokyo University. Four of our trainees have been Presidents of the Society of Nuclear Medicine, the leading professional organization of nuclear medicine. One of my colleagues from Harvard has stated that attending a Hopkins alumni meeting, held every year at the annual Society of Nuclear Medicine meeting, is like a "Who's Who" of world nuclear medicine.

One of my favorite philosophers, William James, said, "What doctrines students take from their teachers are of little consequence provided they catch from them the living, philosophic attitude of mind, the independent, personal look at all the data of life, and the eagerness to harmonize them."

I am also pleased that the field of nuclear medicine is

now an accepted part of medicine throughout the world, and is certain to increase its influence in the future. This is partly the result of the activities of the International Atomic Energy Agency started in 1953 by President Eisenhower.

As I said, nuclear medicine is *in vivo* chemistry, and we exist through the interactions of billions and billions of molecules interacting in the water and fat environment of our bodies.

*Interviewer:* What is the direction of your current research?

*Wagner:* My colleagues and I are making a lot of progress in the study of the relationship between behavior and brain chemistry. We are

not only studying illnesses such as cancer, epilepsy, mental illness, and the like, but also the brain chemistry of normal mental processes. Someday we may learn the brain chemical changes behind violent behavior, destructiveness, and the craving to take illicit drugs. Perhaps the only real alternative to war is a better understanding of the chemistry of the brain.

*Interviewer:* Do you use animals in your research?

*Wagner:* We have developed numerous new procedures in nuclear medicine which are in widespread use in the diagnosis of infections, pulmonary embolism, coronary artery disease, kidney diseases, and many

Dr. Wagner as President of the World Federation of Nuclear Medicine and Biology.

Dr. Wagner instructs Chinese physicians on the use of the "nuclear stethoscope," an instrument developed at Johns Hopkins.

others. All of them were based on test tube studies, followed by extensive animal studies, prior to their use in human beings. Although I have personally used myself as an experimental subject on many occasions (including the world's first lung scanning and imaging of neuroreceptors in the brain), all of our work depends on initial studies in animals. Our research that has been directly beneficial to human beings would have been impossible without animal studies, extending from rodents through dogs and baboons, then to studies in normal persons, and finally, to patients.

*Interviewer:* What are your plans for the future?

*Wagner:* I hope to continue to do re-

### Henry N. Wagner MD

According to Henry N. Wagner MD, the desire for recognition of accomplishments, together with an insatiable curiosity, are common attributes among many research scientists. The former trait was apparent in Dr. Wagner as early as age seven when he spent his summers at Camp St. Martin in Love Point, Maryland. "Competition and recognition were the hallmarks of the life at the Camp during the summer," recalls Dr. Wagner. Although he spent his days playing basketball, volleyball, softball, and swimming, Dr. Wagner believes these activities helped him learn discipline. "One of the first things we learned at camp was to run immediately to a counselor whenever he blew his whistle. We were rewarded for compliance, punished for disobedience and, as a result, we developed the habits and standards that would last a lifetime."

As a young man, Henry Wagner applied the principles he learned at camp to his studies at Calvert Hall. He recalls the high emphasis placed on excellence and would confide his shortcomings to the chaplain of Calvert Hall, Father Henry Louis Brianceau. "Occasionally, he would respond to the recitation of a sin by saying 'You didn't do that,' and I would have to persuade him that I did," says Dr. Wagner who admits, "Sometimes I would go to confession before going to confession." He was valedictorian of his class and received the highest awards in history and religion.

Upon graduation, Dr. Wagner entered the wartime accelerated program at The Johns Hopkins University. During his first year, he studied English, German, physics, chemistry, and mathematics. Years later, he learned that he had covered two years in one. Following his eighteenth birthday, Dr. Wagner entered the Coast Guard Academy. As an underclassman and a swab, he learned seamanship, navigation and, most importantly, how to take orders. He contends his experiences in the Coast Guard taught him that authority does not always have the correct answers; a rationale he maintains helped him to achieve prominence as a researcher. One year later, the atomic bomb was dropped on Hiroshima and Nagasaki and World War II ended.

As a young man, Henry N. Wagner was profoundly influenced by his experiences at summer camp in Love Point, MD.

Shortly after the war, Dr. Wagner returned to Johns Hopkins to begin his extensive medical training. "I clearly

search, write articles and books, give talks, and promote the field of nuclear medicine. I am also pleased to be a member of the Council on Scientific Affairs of the AMA, where I can help the AMA retain its eminence in medical science as well as medical practice.

Within a year, by Hopkins regulations, I must give up my administrative responsibilities at Hopkins, but hope that my creativity and participation in medicine can continue for many more years. I am engaged in a number of NIH grants that will help make this possible. There is still a shortage of physicians, technologists, chemists, and physicists in nuclear medicine.

The Nuclear Medicine Division at Hopkins was the first to image neuroreceptors in the brain of a living human. Dr. Wagner was the subject and the principal investigator in this study of brain chemistry. Pictured above is a PET scan image of Dr. Wagner's brain during the first imaging of opiate receptors in a human being.

remember Dean Alan Chesney telling us pre-medical students that medicine was in a period of great change," says Dr. Wagner. "He said medicine would never be the same and that we should reconsider whether we really wanted to become doctors."

Many of the changes in medicine had already begun by 1946. That year witnessed the first shipment of radioactive substances for biomedical and other scientific research by universities; and the invention of the Univac digital computer. To Dr. Wagner, these two inventions led to the birth of nuclear medicine.

In 1948, Dr. Wagner entered The Johns Hopkins University School of Medicine. After graduating from medical school in 1952, he served his internship at The Johns Hopkins Hospital and progressed to become an assistant resident at the Osler Medical Service at The Johns Hopkins Hospital. In 1957, while working as a clinical associate for the National Institutes of Health, he was selected for a special fellowship at Hammersmith Hospital in the Postgraduate Medical School of London. While in England, he worked in the Endocrine Unit and became interested in studies utilizing radioactive tracers. Dr. Wagner returned to Johns Hopkins and was named Chief Medical Resident for the Osler Medical Service.

Upon completion of his residency, Dr. Wagner joined the Hopkins medical faculty and began working with radioactive isotopes; this led to his appointment as Physician-in-charge of the Nuclear Medicine Division at The Johns Hopkins Hospital in 1964.

Currently, Dr. Wagner is a Professor of Radiology and a Professor of Medicine in The Johns Hopkins School of Medicine; Professor of Environmental Health Sciences in The Johns Hopkins School of Hygiene and Public Health; and Principal Professor on the staff at the Applied Physics Laboratory. He holds honorary degrees from Washington College as well as from universities in Germany and Belgium. Other honors include the first Vikram Surhabel Gold Medal from the Society of Nuclear Medicine of India, the Georg von Hevesy medal, the Hevesy Award from the Society of Nuclear Medicine, as well as numerous honorary fellowships and memberships.

Dr. Wagner's curriculum vitae lists numerous books, chapters and journal articles, and describes hundreds of studies in nuclear medicine. To Dr. Wagner, his most significant work deals with the study of brain chemistry. "Until recently, philosophers, psychiatrists, and psychologists had to rely on soul-searching and introspection to try and fathom the workings of the mind," says Dr. Wagner. "Through nuclear medicine, it is now possible to explore the chemistry of the living brain and its relationship to thinking, behavior, and emotions. If we can learn more about how our brains work, we may be able to change our modes of thinking, allay fears and violence."

Following World War II, recalls Dr. Wagner, many scientists and political leaders hoped that the development of peaceful uses for atomic energy would help eliminate nuclear weapons. Dr. Wagner is optimistic that his research could help curb the cold war mentality. "Physics has given us the power of the atom to destroy," says Dr. Wagner. "The only effective defense against nuclear weapons lies within the human mind. Perhaps, by studying the workings of the mind, biology can help us save ourselves."

Henry N. Wagner MD and his wife, Anne, in China.

## Which Box Would You Rather Deposit Your Insurance Reimbursements In?

If you process your claims through the mail, it takes an average of two months before your reimbursements make it to the bank.

And that can really put you in a box in terms of cash flow.

But not if you join the more than 1800 physicians who are now using HCS electronic claims systems. On the average, they receive payments in days, instead of months. Reason enough to consider using our custom designed systems.

What's more, our systems are labor savers. Stacks of claims that used to take weeks to process by mail can be sent through our claims

network in a matter of hours. Saving you enormously in administrative time. Not to mention postage.

And since HCS has the backing of a billion dollar health care organization, you can depend on us for long term support, service, and solutions as your office needs change.

Call Toll-Free 1-800-543-6741 for more information. Because in rain, snow, sleet or hail, we can deliver insurance reimbursements faster.

*You'll Be Overwhelmed By Your  
Cash Flow, Not Your Overhead.*

# MRI UPDATE

Figure 1

Figure 2

**CLINICAL HISTORY:** This is a 26-year-old male with back pain and right lower extremity radiation.

**FINDINGS:** This is an example of a normal study on a young adult. **COMMENT:** MRI is the screening test of first choice for suspected disorders of the lumbar spine. Notice the clear depiction of the normal L5-S1 disc (figure 1, crossed arrow). The discs of this patient exhibit high signal intensity reflecting normal hydration and none of the discs are narrowed. None of the discs indent the thecal sac which is of intermediate signal intensity and appears as the gray band in the center

of the image. The vertebral bodies are homogeneous and free of destructive lesions. The conus medullaris (arrow) is normal. This sagittal image demonstrates the advantages of MRI over other screening modalities. Routine CT scanning will not display the conus medullaris, lesions of which may masquerade as disc herniation. The general area of coverage is superior with MRI. Disc detail is much better displayed with MRI.

The axial image at L5-S1 (figure 2) exhibits delineation of intraspinal detail far superior to that of CT. The right S1 nerve root is clearly displayed (arrow) surrounded by normal perineural fat

which is the bright high intensity material in the periphery of the spinal canal. State-of-the-art MR images clearly display the bony anatomy of the lumbar spine including the facet joints (crossed arrow). Degenerative diseases and bony neoplasm are routinely detectable.

MRI involves no ionizing radiation and no intrathecal contrast material is needed. It is a patient-friendly outpatient examination well suited for screening purposes.

# Stroke in the Young

## Part II

---

Barney J. Stern MD, Steven Kittner MD, MPH, Michael Sloan MD,  
Constance Meyd MD, David Buchholz MD, Daniele Rigamonti MD,  
Robert Woody MD, John Meyerhoff MD, William Bell MD  
and Thomas Price MD

---

Evaluation of the young stroke patient often requires an interdisciplinary approach because of the complexity of the problems encountered. We discuss some of the less common causes of stroke and present an approach to the patient.

*From Sinai Hospital of Baltimore where Dr. Stern is Director of the Division of Neurology; and from The Johns Hopkins Medical Institutions where Dr. Stern is Associate Professor of Neurology, Dr. Buchholz is Associate Professor of Neurology and Director of Ambulatory Services for Clinical Neurosciences, Dr. Meyd is Assistant Professor of Neurology at the Francis Scott Key Medical Center, and Dr. Bell is Professor of Medicine and Radiology; and from the University of Maryland Medical Systems where Dr. Price is Professor of Neurology and Epidemiology and Preventive Medicine, and Director of Stroke Services, Dr. Sloan is Assistant Professor of Neurology and Director of the Neurovascular Laboratory and Neurological Critical Care Unit, Dr. Kittner is Assistant Professor of Neurology and Epidemiology and Preventive Medicine, and a member of the Stroke Center, Dr. Rigamonti is Assistant Professor in the Department of Neurosurgery, Dr. Meyerhoff is Assistant Professor of Medicine in the Division of Rheumatology and Clinical Immunology, and Dr. Woody is the former Director of Pediatric Neurology.*

*Dr. Kittner is supported in part by a Clinical Investigator Development Award (KO8-NS01319-01) from the National Institute of Neurological Disorders and Stroke, Bethesda, MD; by a Grant-in-Aid from the American Heart Association (AHA); and by funds contributed by the AHA Maryland Affiliate, Inc.*

*Reprints: Barney J. Stern MD, Division of Neurology, Sinai Hospital of Baltimore, Belvedere at Greenspring, Baltimore, MD 21215.*

In Part I of this series (June 1991), we explored some of the more common etiologic categories of stroke in young patients. In this article, we discuss conditions that are less commonly complicated by stroke. We also present an overall approach to the young stroke patient. In particular, we emphasize the timing and sequencing of diagnostic tests and how this contributes to optimal patient management.

### Pregnancy

The pregnant woman is subject to any of the causes of stroke in the young.<sup>1</sup> She is, however, also at risk for problems unique to pregnancy, labor and delivery, and the postpartum state. Management of certain conditions such as aneurysmal subarachnoid hemorrhage (SAH) and arteriovenous malformation (AVM) is often complicated by concerns for the health of the fetus. Some conditions unique to pregnancy include peripartum cardiomyopathy, a hypercoagulable state, air emboli, vascular hyperplasia, and eclampsia. Furthermore, a disease can masquerade as stroke and be relatively unique to pregnancy; for instance, metas-

tatic trophoblastic carcinoma can present as an intracerebral hemorrhage.

Diagnosis is aided by relating the time of the stroke to the course of the pregnancy and the postpartum period (Table 1). Management decisions may be influenced by pregnancy. For example, coumadin should be avoided during the first trimester and after the thirty-second to thirty-eighth week of gestation because of its teratogenic and hemorrhagic effects, respectively, and mannitol therapy for increased intracranial pressure may severely dehydrate the fetus.

### Rheumatic Diseases

The frequency of neurologic manifestations varies greatly among the rheumatic diseases; stroke is rarely the major form of involvement.<sup>2,3</sup> When stroke does occur, it is even less likely to be the initial manifestation of the rheumatic disease. Thus, the usual questions regarding the rheumatic diseases when faced with a patient with a stroke are: Is there any underlying rheumatic disease present? And, is this stroke a manifestation of an active rheumatic disease?

For most of the rheumatologic syndromes there is nothing clinically specific about their central nervous system (CNS) involvement which would allow one to make the diagnosis of an immunological illness in the absence of systemic findings. Rheumatoid arthritis,<sup>2,3</sup> systemic lupus erythematosus (SLE),<sup>4</sup> scleroderma,<sup>2,3</sup> Behcet's syndrome, Sjogren's syndrome, polymyositis, cryoglobulinemia, and Henoch-Schonlein purpura have all been reported to cause stroke or stroke-like syndromes.

Serologic studies are not usually very helpful in diagnosing the cause of a stroke. Rheumatoid factor, which will confirm the diagnosis of rheumatoid arthritis in a patient with typical rheumatoid changes, is positive in too many other diseases to be useful in defining other diagnoses. An erythrocyte sedimentation rate (ESR) is recommended as part of the initial evaluation of the

young stroke patient but has limitations because of its lack of specificity. An elevated ESR in a young stroke patient should suggest that there may be an atypical cause, but a specific diagnosis is not provided. Even patients with biopsy-proven vasculitis can have a normal ESR.

Although Lyme disease does not usually cause stroke,<sup>5</sup> its neurologic manifestations (neuroborreliosis) may be mistaken for stroke. There are several case reports of patients with Lyme disease who have a cerebral vasculitis thought to be analogous to the cerebral vasculitis of syphilis. The role of serologic tests in the confirmation of neuroborreliosis is unclear. A negative Lyme antibody assay should rule out the disease in an individual who has non-neurologic systemic symptoms suggestive of Lyme disease. Conversely, a positive titer only indicates previous infection and does not prove active CNS involvement. Some authors feel they can confirm neuroborreliosis by various cerebrospinal fluid (CSF) tests while others disagree.

Sjogren syndrome is a cause of neurologic disease including stroke. The best screening test for Sjogren syndrome is questioning the patient about sicca symptoms followed by an ophthalmologic exam for evidence of dry eyes. If only sicca symptoms are present (without evidence for rheumatoid arthritis, SLE, or scleroderma), a minor salivary gland biopsy to confirm the cause of the sicca symptoms may be helpful. Sarcoidosis is a rare cause of ischemic stroke and can cause dry eyes; demonstrable systemic disease is helpful in making a diagnosis.

The greatest dilemmas occur with SLE. When a young patient with a positive antinuclear antibody (ANA) has a stroke early in the course of typical multisystem disease, it is likely that the stroke is due to SLE.<sup>4</sup> The pathophysiology of stroke in SLE is not clear. Antiphospholipid associated with thrombosis, rather than vasculitis, may be the etiology of stroke in these patients. While valvular lesions in SLE may be more common than previously thought, they do not seem to be a major cause of stroke. When a patient has had SLE for years, does not have active inflammatory disease in other organ systems, and has other risk factors for stroke, it is difficult to be sure that the stroke is due to SLE.

In contrast, when a patient has a stroke and a positive ANA, but no other findings of SLE, one should be hesitant to make a diagnosis of SLE. Estimates of the frequency of a positive ANA range from 0 to 7 percent in healthy people, 17 percent in hospitalized patients, 33 percent in relatives of patients with SLE,<sup>6</sup> and 49 percent in patients with inflammatory nondegenerative rheumatologic conditions. Thus, there are many other explanations for a young stroke patient to have a positive ANA.

SLE rarely presents only neurologically. In these patients, a positive ANA may be the clue that SLE is present. Serologic testing for highly specific anti-native deoxyribonucleic acid

**Table 1. Major Risk Periods for Selected Stroke Syndromes in Pregnancy and the Puerperium**

	Trimester		Labor/Delivery	Postpartum
	2	3

(DNA) and Sm antibodies should be performed. Although a positive result from either test will confirm the diagnosis, a negative test does not eliminate the possibility of SLE since the tests are not very sensitive. The presence of thrombocytopenia or cutaneous vasculitis is suggestive of SLE since these findings are associated with neuropsychiatric lupus.<sup>4</sup>

Isolated angiitis of the central nervous system (also known as primary or granulomatous angiitis of the CNS) is, by definition, associated with no systemic symptoms. This disease is suggested in a young patient who presents with severe headache, change in mental status, and focal neurologic deficits.

Even if systemic findings are present, the diagnosis of a particular vasculitis is best made by biopsy of involved vessels, although there may not be a therapeutic need to separate the necrotizing vasculitides (polyarteritis nodosa, Churg-Strauss syndrome, polyangiitis overlap syndrome, and Wegener disease). An exception is Takayasu disease which can be diagnosed on the basis of arteriography. Occasionally, one can identify polyarteritis nodosa radiographically based on the presence of vascular aneurysms.

In most cases, diagnosis of a rheumatic disease as the cause of a stroke suggests that the patient needs treatment with immunosuppressive therapy. Cytotoxic therapy is currently preferred for the necrotizing vasculitides; corticosteroids can be used acutely to suppress inflammation. Corticosteroids are usually the initial therapy for the other inflammatory diseases. The exceptions are Lyme disease which should be treated with antibiotics, and cryoglobulinemia which acutely can be treated with plasmapheresis.

### Cancer and Stroke

Graus et al have extensively reviewed the cerebrovascular complications of cancer and its treatment.<sup>7</sup> There are several major mechanisms leading to stroke in this population: direct effect of the tumor, coagulopathies, and complications of medical interventions.

Tumor emboli, especially from germ cell tumors and intracardiac myxomas, can lead to embolic infarctions and neoplastic aneurysms with intraparenchymal and subarachnoid hemorrhage. Dural metastases are associated with superior sagittal sinus thrombosis and subdural hematoma.

Bleeding into a tumor can result in apoplectic neurologic deterioration and occurs most often with metastasis from germ cell tumors and melanoma. Bleeding also occurs in primary brain tumors including astrocytomas and oligodendrogliomas, meningiomas, and pituitary adenomas.

Acute promyelocytic leukemia is associated with disseminated intravascular coagulation (DIC) and 60 percent of patients die from intracranial hemorrhage. Acute myelogenous and lymphoblastic leukemias cause hemorrhage events because of thrombocytopenia, leukostasis, or CNS parenchymal leukemic nodules.

Nonbacterial thrombotic endocarditis (NBTE) is a

cause of cardiogenic embolism.<sup>8</sup> Adenocarcinomas of the lung and gastrointestinal tract are particularly associated with NBTE. The cause of NBTE is unknown but the association of NBTE with mucin secreting tumors and chronic DIC has raised the question of a hypercoagulable state. Mucin alone can embolize and cause stroke. Chronic DIC has been associated with ischemic and hemorrhagic infarction, as well as a generalized encephalopathy.

Non-metastatic, superior sagittal sinus thrombosis has been associated with lymphoma and breast cancer and can cause hemorrhagic venous infarctions. Other cerebral veins may be thrombosed as part of a paraneoplastic syndrome, probably related to a hypercoagulable state.

Head and neck irradiation damages the microvasculature and, perhaps by affecting the vaso vasorum, can also cause delayed large vessel occlusive disease. Younger patients develop symptomatic vascular disease more rapidly than patients who are older at the time of irradiation; this may be related to the size of the vessel being treated. A *moya moya* pattern can develop after cranial irradiation. Therapeutic options for radiation-associated vasculopathy include antiplatelet and anticoagulant treatment, endarterectomy, and bypass grafts.

L-asparaginase, used to treat acute lymphoblastic leukemia, results in both depletion of proteins required for thrombosis, as well as impaired fibrinolysis. Parenchymal hemorrhage, ischemic arterial infarction,<sup>9</sup> and venous thrombosis with hemorrhagic infarction can occur.

### Stroke and Human Immunodeficiency Virus (HIV) Infection

Clinically, only 0.75 to 1.3 percent of acquired immunodeficiency syndrome (AIDS) patients have a stroke.<sup>10,11</sup> Stroke syndromes can rarely be the presenting feature of AIDS. Clinically evident ischemic infarction has been associated with cardiogenic embolism from nonbacterial thrombotic endocarditis, and the vasculopathy associated with cryptococcal and tuberculous meningitis, lymphoma, and herpes zoster. A cerebral granulomatous angiitis and eosinophilic vasculitis associated with HIV have been described, as has an "aneurysmal dilatation of the arteries of the circle of Willis."<sup>11</sup> The lupus anticoagulant can be found in AIDS patients. Patients can also have transient stroke-like events; this is particularly true for patients with CNS toxoplasmosis.

In a pathologic series of eighty-three AIDS and AIDS-related complex (ARC) cases, twenty-eight patients (34 percent) had evidence of cerebrovascular disease.<sup>12</sup> Ischemic infarction was almost eight times more prevalent than hemorrhagic lesions. Most ischemic infarcts were not clinically evident and involved multiple microscopic sites. Intraparenchymal arterioles had thickened fibrous walls and there was rare perivascular lymphocytic infiltration or vasculitis.

Some two-thirds of cases had calcified intraparenchymal vessels but this finding was not correlated with ischemic infarction. Five patients (6 percent) had intracranial hemorrhages; only two patients had clinical correlates of their CNS bleeding. There was no obvious vascular pathology that could be implicated as a cause of hemorrhage.

HIV-infected patients can develop a particularly aggressive form of meningovascular syphilis with ischemic infarction. Intensive therapy is indicated to treat CNS syphilis.

Hemorrhagic events have been related to thrombocytopenia, ruptured mycotic aneurysm, and bleeding into metastatic Kaposi's sarcoma.

### Pediatric Stroke Disorders

Many causes of ischemic and hemorrhagic stroke share common pathophysiologies in both pediatric and adult patients. There are, however, several causes of stroke which are characteristic of the pediatric age group (Table 2). Since many of these children will survive beyond their teenage years, physicians treating adults need to be aware of stroke syndromes in infants and children.

Homozygous sickle cell disease is a common cause of stroke in children. A variety of small, medium, and large vessel pathologies are present. Penetrating artery

occlusion, intimal proliferation and medial degeneration of medium and large vessels, and *moya moya* syndrome are described. A bimodal distribution is seen with a peak of ischemic infarction in the first decade of life and a peak of SAH in the second and third decades.<sup>13</sup> Cerebral angiography can be safely performed in patients with sickle cell anemia if the proportion of hemoglobin S is less than 20 percent after exchange transfusion. Since sickle cell vasculopathy is a disorder which occurs in a well-defined population and is both potentially preventable and treatable with hypertransfusion therapy, it is of special medical and public health importance.

Vasculopathy rarely occurs in patients with neurofibromatosis. A possibly progressive vasculopathy characterized by intimal hypertrophy and medial degeneration has been observed. Angiographic findings closely resemble those seen in sickle cell vasculopathy. The clinical presentation of neurofibromatosis-associated cerebrovascular disease varies with age: arterial occlusion and a *moya moya* pattern characterize patients in the first decade of life while those who survive into their second and third decades have a higher incidence of multiple aneurysms and *moya moya* syndrome with hemorrhagic events.

Stroke is a common sequela of severe meningitis in children, especially *hemophilus influenzae*, pneumococcal and tuberculous meningitis. Purulent material about the basilar cisterns and orbitofrontal areas of the brain envelops the circle of Willis and smaller arteries and veins leading to thrombus formation.

The anatomic potential for embolic disease to the brain is much higher in children with cardiac anomalies with right to left shunts such as tetralogy of Fallot, transposition of the great vessels, and tricuspid atresia. Complications of cardiac catheterization are relatively uncommon.<sup>14</sup>

Although both small and large vessel ischemic stroke syndromes were commonly reported complications during and after open heart surgery in the 1950s and 1960s, improvements in bypass techniques and filtering systems have reduced stroke in children undergoing these procedures. Microvascular disease presenting as postoperative encephalopathy may still occur. Watershed infarctions can also occur as a result of decreased perfusion during operations in which major vascular anastomoses are performed.

An unusual cause of stroke in children is carotid injury due to blunt intra-aural trauma from a pencil or toy.<sup>15</sup> Actual penetration of the artery rarely occurs and the event may be initially considered trivial. Neurologic symptoms can develop several hours to days later, probably due to intimal damage leading to thrombosis.

Child abuse commonly presents as acute and otherwise unexplained stupor or status epilepticus in the young child. In particular, the whiplash-shake injury syndrome which occurs as the infant or toddler is grabbed by the shoulders and forcibly shaken may cause severe intracranial vascular damage. The common physical findings of preretinal and retinal hemor-

**Table 2. Syndromes and Diseases Presenting with Stroke in the Pediatric Age Group**

Genetic disorders
Sickle cell disease
Thromboembolic disease to medium and large arteries
Intracranial hemorrhage from rupture of <i>moya moya</i> syndrome
Neurofibromatosis cerebrovasculopathy
Osler-Weber-Rendu syndrome
von Hippel-Lindau disease
Tuberous sclerosis
Marfan's syndrome
Intracranial infections
Vasculitic complications of bacterial meningoencephalitis
Sinus thrombosis from facial or otitic infections
Complications of congenital and acquired heart disease
Embolic complications of left ventricular and aortic valvular lesions
Embolic complications of rheumatic heart disease
Embolic complications of infectious endocarditis
Complications of open heart surgery
Trauma
Oral foreign bodies disturbing the pharynx and carotid artery
Arterial and venous lesions from child abuse: whiplash-shake injury; carotid arterial damage from strangulation
Arteriovenous malformations
Vein of Galen syndromes of infancy associated with AVMs
Other AVMs of older infants and children
Fetal and perinatal disorder
<i>In utero</i> fetal ischemic and thrombotic strokes
Periventricular leukomalacia of the preterm infant
Germinal matrix hemorrhage of the preterm (and much less commonly, term) infant
Metabolic disorders
Homocystinuria
Hypoalbuminoproteinemia
Menke's syndrome
Mitochondrial cytopathies: Mitochondrial myopathy, encephalopathy, lactic acidosis and stroke-like episodes (MELAS)

rhages is often a reflection of the severe intracranial shearing forces which have occurred. Arterial thrombosis, subdural hematoma, intraparenchymal hematoma with intraventricular extension, and catastrophic intracranial subintimal arterial dissection can occur.

In pre-adolescents, AVM is a more frequent cause of SAH than aneurysm. The vein of Galen aneurysm is a special kind of AVM which typically presents in infancy with congestive heart failure and hydrocephalus. In older children, SAH or intracerebral hemorrhage can occur.

A variety of rare but well-described vascular syndromes occur on a genetic basis in children. These have been extensively reviewed by Natowicz and Kelley.<sup>16</sup> Homocystinuria occurs from a deficiency of cystathionine beta-synthetase and is associated with arterial and venous thrombotic and thromboembolic disease and a marfanoid habitus. Recent reports have suggested that the heterozygote for homocystinuria may also be at risk for premature cerebrovascular disease, although this is controversial. Familial hypoalphalipoproteinemia, a high-density lipoprotein (HDL) deficiency state, may be associated with premature coronary artery disease and stroke. A spectrum of disorders of organic acid metabolism recently has been found to be associated with stroke-like presentations and pathologies. These disorders include methylmalonic, propionic, isovaleric and glutaric Type 1 acidemias, and Leigh's disease. The mitochondrial encephalomyopathies, especially mitochondrial myopathy, encephalopathy, lactic acidosis, and stroke-like episodes (MELAS syndrome) frequently present with stroke. Osler-Weber-Rendu syndrome (hereditary hemorrhagic telangiectasia), characterized by telangiectasias of the brain, viscera, mucous membranes, and skin, may present with moya moya syndrome and embolic and hemorrhagic strokes. Rarely, tuberous sclerosis and Down's syndrome may be associated with stroke.

Approach to the Patient

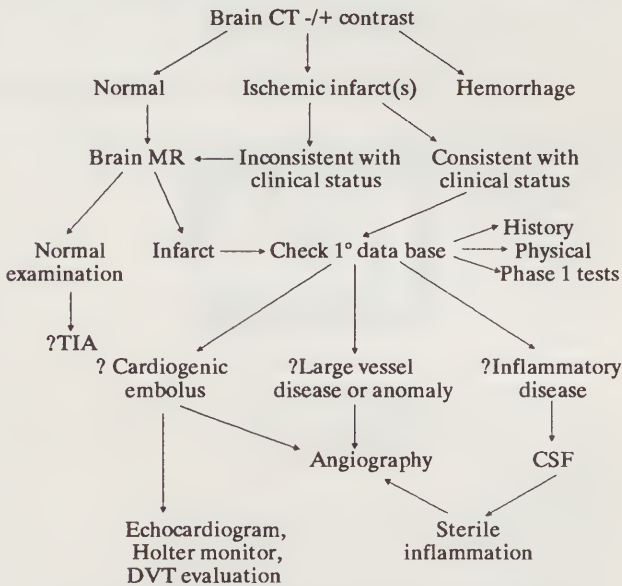

The care of each young stroke patient must be individualized. Age, the severity of the neurologic deficit, and known medical conditions all influence the approach to the patient. Stroke may be the first sign of underlying systemic illness. Given the vast array of diagnostic considerations, a systematic approach to the patient needs to be followed so as not to overlook any etiologic considerations. A thorough patient history and physical examination, as outlined in Tables 1 and 2 of Part I of this series, can provide important information.

Figures 1A and 1B present algorithms with which to approach the patient. The outlines can be modified as necessary for each patient. A brain computed tomography (CT) scan serves as the initial triage point in deciding whether the patient has had an ischemic (Figure 1A) or hemorrhagic (Figure 1B) event. Other diagnoses such as neoplasia or infection can be suggested by CT scan. A brain magnetic resonance imaging

(MRI) scan, because of its exquisite sensitivity, can yield additional information if the CT scan is normal or gives results inconsistent with the clinical picture.

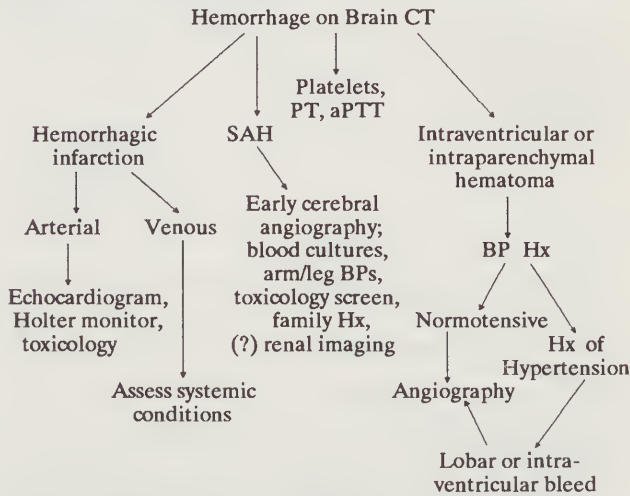

For patients with an ischemic event, the information obtained from CT or MR images should be integrated with the patient's history and examination to make an initial clinical assessment regarding the probability that the stroke is due to a cardiogenic embolus, large vessel disease, a vascular anomaly, or CNS inflammatory disease. Readily available information from the clinical laboratory can provide additional information (Table 3).

Figure 1A. Algorithm: Acute Stroke-like Event

TIA = transient ischemic attack, DVT = deep vein thrombosis, CSF = cerebrospinal fluid, CT = Computed tomography

Figure 1B. Algorithm: Acute Stroke-like Event

PT = prothrombin time, aPTT = activated partial thromboplastin time, Hx = history, BP = blood pressure, CT = Computed tomography

Cerebral angiography is central to the evaluation of many young stroke patients and can be safely performed early in the clinical course.<sup>17</sup> Angiography can document cerebral emboli, although angiograms performed later than forty-eight hours after a stroke may not be as diagnostically helpful because of decreased specificity and sensitivity.<sup>18</sup> Large vessel disease and vascular anomalies are easily visualized with angiography. Since etiologic considerations can often be narrowed down once the vascular anatomy is visualized, unnecessary testing can be avoided. Therefore, early angiography should be considered an integral part of the evaluation of many young stroke patients, unless the presence of a CNS infection or systemic illness closely associated with stroke makes this invasive test

unnecessary. Angiographic dye can cause serious complications when used indiscriminately in some conditions such as homocystinuria and sickle cell disease.

Table 3 compartmentalizes the diagnostic evaluation into phases. Tests in Phase One are readily available and results, in general, can be rapidly obtained to help guide acute management. Phase Two and Three tests are often performed within a day or so of the patient's presentation; if infection is suspected, a lumbar puncture should be done emergently if there is no contraindication.

Phase Four tests should be performed if the diagnosis remains elusive. Results are often not available in a timely fashion; therefore, acute management often needs to proceed independently of a specific diagnosis.

As new causes of stroke are identified, we suspect that the number of tests in Phase Four will grow.

Figure 1B continues the algorithm for hemorrhagic strokes. Here, the initial distinction is among hemorrhagic infarction, subarachnoid hemorrhage, and intraventricular and intraparenchymal hematoma. Obviously, these categories can coexist, but often one process is dominant as judged by clinical presentation and CT scans.

A history of hypertension and the location of a hematoma affect the likelihood of finding an underlying lesion on angiography. Normotensive patients and hypertensive patients with a lobar or intraventricular hemorrhage are most likely to have an aneurysm or AVM demonstrated on angiography.<sup>19</sup>

Critically ill patients need treatment even while diagnostic investigation is underway. Therapy for increased intracranial pressure and systemic disorders should proceed as appropriate. It is hoped that the more rapidly and accurately the cause of a patient's stroke is defined, the more effective overall patient management will be.

Future challenges for the study of young stroke patients include determination of the incidence and prevalence of the various stroke etiologies; further definition of risk factors and pathophysiology; validation of diagnostic and therapeutic protocols, and

**Table 3. Ischemic Infarction Diagnostic Testing**

# Vacation time is burglary time.

Home Protection  
only \$195<sup>00</sup>

**Security  
Systems**

Great Value!

When you leave on your summer vacation, there's enough to do,

percent off the original price of \$395). ADT has the largest network of central monitoring stations to help provide for your 24-hour protection. Remember, this offer is good only until Aug. 17, 1991, so call right away, and have a safe trip! Visa, MasterCard and American

about your home and possessions while you're gone. Summer season is high season for criminals too! Before you leave, call ADT and have an ADT® Safewatch Security system purchased by

Aug. 17, for only \$195 (over 50

Express cards accepted.

### Here's what you get

**ADT Safewatch Security Package**  
2 door contacts  
1 electronic motion detector  
1 interior sounder  
Electronic Control Unit with keypad  
Window Stickers  
Central Station Monitoring for only \$19.95 per month.

Valid until Aug. 17, 1991

Call ADT today at (301) 467-9094  
Only \$195<sup>00</sup>

This coupon is valid for a price of \$195 for the installation of a new ADT Safewatch Security system consisting of 2 door contacts, 1 motion detector, 1 interior sounder, and a control unit with keypad, purchased by 8/17/91, with a central monitoring contract at \$19.95 per month. You must present this coupon upon contract signing. Only one coupon per security system. VISA, MasterCard, and American Express Cards accepted. Not valid with any other discount offer. Original coupons only.

For your insulin-mixing  
or NPH-using patients

## Humulin<sup>®</sup> 70/30 makes life easier

**Rapid onset and sustained  
duration insulin activity  
in a single vial**

- May offer enhanced control through a more physiologic activity profile
- Accurate dosing—eliminates mixing errors
- Convenient premixed dose for better compliance
- Easy to use—for patients who find mixing difficult

**Specify**  
**Humulin<sup>®</sup> 70/30**  
70% human insulin  
isophane suspension  
30% human insulin injection  
(recombinant DNA origin)

**Humulin has  
just the right mix**

Any change of insulin should be made cautiously and only under medical supervision.

Changes in refinement, purity, strength, brand (manufacturer), type (regular, NPH, Lente<sup>®</sup>, etc), species (beef, pork, beef-pork, human), and/or method of manufacture (recombinant DNA versus animal-source insulin) may result in the need for a change in dosage.

# Disseminated Histoplasmosis in AIDS Patients in Maryland

---

Michael A. Sauri MD, MPH & TM, Neil L. Julie MD, Herbert M. Juarbe MD,  
Frank J. Mayo MD, Charles H. Ligon MD, Robert L. Fox MD,  
Gregorio Koss MD, Julian T. Coggin MD, Joy W. Burbach MD,  
Joel H. Barton MD and Joseph D. Mashburn MD

---

*From Montgomery County where Dr. Sauri is an Infectious Disease Specialist, Dr. Julie is a Gastroenterologist, Dr. Juarbe is an Endocrinologist, Dr. Mayo is a Pulmonologist, Dr. Ligon is a General Surgeon Emeritus, Dr. Fox is a General Vascular Surgeon, Dr. Koss is a Cardiologist, Dr. Coggin is the Head Pathologist at Montgomery General Hospital, Drs. Burbach and Barton are Clinical Pathologists at Shady Grove Adventist Hospital, and Dr. Mashburn is Director of Laboratories at Shady Grove Adventist Hospital, Washington Adventist Hospital, and Leland Memorial Hospital.*

---

*Disseminated histoplasmosis is increasingly recognized as an opportunistic infection associated with the acquired immunodeficiency syndrome (AIDS). It should be considered in all AIDS patients with perplexing clinical presentations.*

---

**H**istoplasmosis is the most common systemic mycosis in the United States, with an estimated 500,000 new infections per year.<sup>1</sup> Historically, disseminated disease develops in one in 2,000 infected individuals.<sup>1</sup> Sixty-eight patients with acquired immunodeficiency syndrome (AIDS) and disseminated histoplasmosis have been reported in the literature as of August 1988.<sup>2</sup> Disseminated histoplasmosis is increasingly recognized as an opportunistic infection associated with AIDS.<sup>3-7</sup> Recent reports of disseminated histoplasmosis in AIDS patients from the river valleys throughout the United States, the Caribbean, and Central and South America, parallel the reports of AIDS in areas where histoplasmosis is endemic.<sup>2,4</sup> Maryland is at the eastern fringe of histoplasmosis endemicity<sup>7</sup> and cases of pulmonary histoplasmosis have been reported.<sup>8,9</sup>

The following three AIDS patients were diagnosed with disseminated histoplasmosis in Montgomery County hospitals between April 1988 and August 1990.

## Case Number One

A sixty-eight-year-old white female was admitted with a one-day history of fever (104° F.) and recurrent abdominal pain. She had a history of AIDS since a 1987 diagnosis of *Pneumocystis carinii* pneumonia, which had been contracted due to a transfusion following nonsteroidal, anti-inflammatory, drug-induced, upper gastrointestinal bleeding in 1981. The patient had just been hospitalized four months previously with a diagnosis of acute cholecystitis secondary to cholelithiasis treated conservatively with antibiotic therapy alone. Past medical history was remarkable for recurrent intermittent abdominal obstruction and diarrhea during the preceding two years; allergy to Bactrim (trimethoprim and sulfamethoxazole), and gastrointestinal intolerance to azidothymidine (AZT); radiographically stable left lung mass

since June 1988; moderate, chronic anemia; and a canary and a parrot for pets.

On admission, she was cachectic, febrile (101° F.), anicteric, and in moderate distress due to abdominal distention and pain. Significant findings on physical exam were limited to the abdominal exam which revealed normal bowel sounds in a distended, tender, tympanitic abdomen without organomegaly, ascites, guarding, rebound, or rigidity. Initial workup included an acute abdominal series revealing a marked small bowel obstruction.

Preoperative evaluation was remarkable for a white count of  $8.0 \times 10^3$  with seventy-seven neutrophils and a hemoglobin of 10.9; sequential multi-chemistry analysis (SMA-18) was normal except for a sodium level of 120, an albumin level of 2.4, a calcium level of 8.2, and mildly elevated transaminases. She underwent an exploratory laparotomy with removal of a  $2.0 \times 1.1 \times 0.7$  cm mesenteric mass responsible for the obstruction. Pathologic examination revealed granulomatous inflammation with disseminated histoplasmosis associated with extensive and dense serosal adhesions and lymph node involvement. (Figures 1 and 2)

She elected not to pursue further therapy and died four days after discharge.

### Case Number Two

A seventy-one-year-old white male farmer from Howard County was admitted with a three-week history of confusion, progressive weakness, right upper quadrant abdominal pain, fever (104° F.), a fifteen-pound weight loss, and melanotic stool. Past medical history was remarkable for transfusion during a 1984 abdominal aortic aneurysm repair; perforated diverticulum with a subsequent sigmoid colectomy in 1982; numerous hospitalizations for alcohol abuse; arteriosclerotic heart disease with ventricular dysrhythmias after an inferior wall myocardial infarction; septicemia in 1986; a heavy smoking history with emphysema; and degenerative arthritis.

On admission, he was cachectic, pale, anicteric, and in moderate distress due to fever (104° F.) and abdominal pain. Significant findings on physical ex-

amination were limited to the abdominal exam which revealed a distended, tympanitic abdomen with normal bowel sounds. The liver was tender and enlarged (4 cm below right costal margin) with well-healed midline and left lower quadrant incisional scars. Rectal exam confirmed melanotic stool.

Workup in the hospital revealed nodular pulmonary infiltrates on chest x-ray; enlarged fatty liver; extensive moderate interstitial disease of the lung by computed tomography (CT) scan of the chest and abdomen; cholelithiasis with normal common bile duct by abdominal ultrasound; fatty metamorphosis with non-specific triaditis by liver biopsy; and a low density area in right posterior temporal lobe consistent with brain abscess by CT scan of the head (without contrast). Significant laboratory test findings were moderate anemia hemoglobin (Hgb) (9.4 after two units of packed red blood cells (PRBC)), leukopenia white blood count (WBC) ( $3.8 \times 10^3$  with 52 segments and 34 bands) and thrombocytopenia (76,000), elevated transaminases, and human immunodeficiency virus (HIV) antibody positivity.

He underwent a colonoscopy which revealed a 4 cm ulceration of the ileocecal valve and multiple colonic lesions. Pathologic evaluation revealed granulomatous colitis with intracellular organisms consistent with histoplasmosis in the descending colon, cecum, and ascending colon (Figure 3)

He elected not to pursue further therapy and died sixteen days after admission.

Significant autopsy findings were:

1. Nodular granulomas of lung with focal caseous necrosis; negative for pneumocystis and cytomegalovirus; and positive for intracytoplasmic histoplasmosis (Gomori's methenamine silver (GMS) stain).
2. Recent subendocardial myonecrosis with old myocardial infarction.
3. Micronodular cirrhosis with fatty metamorphosis with scattered small granulomas.
4. Necrotic granulomas containing histoplasma organisms of the colon, spleen, and lymph nodes.
5. Presumed central nervous system (CNS) histoplasmosis (head not examined).

**Figure 1.** Base of small bowel ulcer. Histiocytes with intracellular organisms. 1000x hematoxylin and eosin.

**Figure 2.** Base of small bowel ulcer. Histiocytes with intracellular yeast forms of *Histoplasma capsulatum*. 1000x methenamine silver.

6. Distended gallbladder filled with bile and small stones. No stones in bile ducts.
7. Diverticulosis.
8. Abdominal aorta aneurysm.

The autopsy summary indicated transfusion-related acquired immunodeficiency syndrome with a pure infection of *Histoplasma capsulatum* involving the lungs, liver, spleen, colon, and lymph nodes.

### Case Number Three

A forty-two-year-old white male presented with a six-month history of chronic headaches, seizure disorder, leg paresthesias associated with fever (101 - 105° F.), chills, night sweats, a thirty-six-pound weight loss, mildly elevated liver transaminases, and an elevated sedimentation rate (60). He underwent two extensive but unrevealing neurologic evaluations (including cerebrospinal fluid (CSF) analysis, electroencephalogram (EEG), electromyogram (EMG), and magnetic resonance imaging (MRI) of the head), as well as ear, nose and throat (ENT), dental, and ophthalmologic consultations during the six months prior to admission. The fever of unknown origin (FUO) workup during this period culminated in an admission for a mediastinoscopy to evaluate a change in his chest x-ray within the prior two weeks.

Significant facts in his past medical history were a homosexual lifestyle; idiopathic thrombocytopenia purpura diagnosed eleven months previously, culminating with a curative splenectomy seven months prior to admission; an eleven-month history of HIV positivity with a CD<sub>4</sub> count of 113 (Centers for Disease Control (CDC) Group IIB Symptomatic HIV Infection) on low dose AZT and monthly aerosolized pentamidine since diagnosis; controlled hypertension; a history of gouty arthritis and nephrolithiasis; hyperlipoproteinemia and exogenous obesity; recurrent benign tumors of the rectum, parotid glands, and subcutaneous tissue in the remote past; herpes simplex oralis; and molluscum and contagiosum of the face and chest.

On admission, he was obese and in moderate distress due to fever and dehydration. Significant physical find-

ings were a resting tachycardia (140), fever (103.2° F.), no palpable lymphadenopathy, nonfocal neurological exam except for head twitching and involuntary jerks, and poor cognitive skills.

Pertinent laboratory findings were mildly elevated transaminases, a fasting hypoglycemia, CD<sub>4</sub> of 74 (ratio 0.39), an elevated beta-2-microglobulin, and a markedly elevated P<sub>24</sub> antigen (despite AZT therapy). Extensive serological, parasitic and pan-cultures were unremarkable except for IgG (not IgM) titers for herpes I and II and the absence of detectable titers for *Histoplasma* (both during this admission and at the start of the FUO workup six months previously).

During his hospitalization, the workup showed an elevated left hemidiaphragm compared with a chest x-ray taken two weeks prior, a mildly enlarged periaortic and mediastinal lymphadenopathy by CT scan of the abdomen and chest, and an unremarkable bone marrow aspirate and biopsy, including fungal and acid fast bacillus (AFB) stains.

The patient underwent a mediastinoscopy and lymph node biopsy which revealed granulomatous disease with negative fungal and AFB stains. Pending culture results, he was empirically started on mycobacterium avium-intracellular therapy without improvement. Four weeks after the biopsy, the bone marrow cultures grew out *Histoplasma capsulatum* and, in retrospect, the GMS stain was found to be positive for intracellular organisms with *Histoplasma capsulatum* (Figure 4). He became afebrile within twenty-four hours and all other signs and symptoms resolved within two weeks after the initiation of amphotericin B therapy.

### Clinical Manifestations

In 1985, the CDC revised the case definition of AIDS to include disseminated histoplasmosis in the absence of other immune suppression and with evidence of HIV infection.<sup>10</sup> Most of the cases of disseminated histoplasmosis in patients with AIDS have been reported in persons with an exposure history (i.e., residence or travel in endemic areas such as the Ohio, Mississippi and St. Lawrence River Valleys; living in proximity to

Figure 3. Colon biopsy. High power view of granuloma showing histiocytes with intracellular yeast forms of *Histoplasma capsulatum*. Methenamine silver.

recognized roost sites of chickens, birds or bats;<sup>2</sup> or engaged in home renovating, farming, or spelunking).

The clinical presentation in AIDS patients appears to result from reactivation of a latent infection.<sup>4</sup> Unfortunately, the clinical manifestations in AIDS patients are not specific as in acute self-limited illness in immunocompetent hosts,<sup>11</sup> and they usually include chronic fever and weight loss.<sup>3</sup> Pulmonary involvement is common but nonspecific.<sup>5</sup> Chest x-ray findings may be absent, show mediastinal widening or calcified granulomas, or resemble bacterial pneumonia, *Pneumocystis carinii* pneumonia, or tuberculosis.<sup>5</sup> The clinical manifestations are often more severe and unusual in patients with AIDS than in other immunocompromised patients.<sup>5,7</sup> A clinical syndrome resembling gram-negative sepsis has been reported.<sup>6</sup> Thrombocytopenia, chorioretinitis, and meningoencephalitis with brain microabscesses have each been described as initial signs in disseminated histoplasmosis in AIDS patients.<sup>5-7</sup> The predisposition to serious *Salmonella* infections is suspected to be due to the further blockade of the reticuloendothelial system by histoplasmosis,<sup>7</sup> and is similar to what has been observed in patients with bartonellosis and AIDS. Although rare, gastrointestinal disease presenting as a large cecal mass or jejunal bleeding,<sup>12</sup> and cutaneous disease presenting as oral and perianal ulcerations, folliculitis, macular and papular lesions, have been reported.<sup>7</sup>

### Diagnosis

In cases in which the travel history is not fully known or an exposure history is not obtained, the diagnosis of disseminated histoplasmosis may be easily overlooked in the evaluation of AIDS patients with diagnostic dilemmas. Most studies on disseminated histoplasmosis in patients with AIDS identify bone marrow biopsy and culture as the easiest and most reliable means for establishing the diagnosis, especially during an FUO workup.<sup>2,4</sup>

Blood cultures are frequently positive, but require a special lysis centrifugation system not available in most hospitals.<sup>3</sup> Lymph node, lung, and liver biopsies can be diagnostic and may show the presence of non-caseating or caseating granulomas.<sup>5</sup> Wright-Giemsa stain or Gomori's methenamine silver stain reveal the characteristic *Histoplasma capsulatum*-containing histiocytes.<sup>14</sup> *Histoplasma* serologic tests are frequently negative.<sup>3,4,7</sup>

### Therapy

Amphotericin B remains the treatment of choice. However, it is less effective in AIDS patients than in other immunocompromised patients.<sup>7</sup> Relapse has been observed with interrupted courses of amphotericin B. Since a cure is unachievable and the relapse rate is greater than 90 percent in AIDS patients with disseminated histoplasmosis, there is no basis for giving a large initial course of amphotericin B.<sup>7</sup> Limited clinical trials with ketoconazole have demonstrated treatment failures when it has been used as the initial treatment, as well as when it has been used as suppressive therapy following initial treatment with

amphotericin B.<sup>3,7,13</sup> Consequently, a course of amphotericin B (1.0 to 1.5 gms) over six to eight weeks, followed by an indefinite course of suppressive therapy with either amphotericin B (1 mg per kg per week) or ketoconazole (400 mg daily), is a reasonable approach.<sup>7</sup>

### Summary

These patients demonstrate the difficulty in arriving at the diagnosis of disseminated histoplasmosis. The diagnosis in two of the three patients also served as the initial AIDS case-defining opportunistic infection. In each of these patients, the clinical presentations were atypical and in only one patient was a positive exposure history elicited. Recurrent bowel obstruction was the presenting complaint in the first patient and the diagnosis was made only on pathologic exam of the resected small bowel. The second patient's diagnosis was made on biopsy of the colon via colonoscopy. The third patient's diagnosis also eluded an extensive FUO workup; he was diagnosed by bone marrow culture and silver stain of a mediastinal lymph node biopsy, despite serial negative serologic tests for histoplasmosis. The first two patients had significant gastrointestinal disease which is a relatively unusual manifestation for disseminated histoplasmosis. The third patient illustrates the limited diagnostic usefulness of serologic testing in AIDS patients and the continued usefulness of bone marrow analysis in an FUO evaluation.

In conclusion, these case presentations demonstrate that disseminated histoplasmosis in patients with HIV infection can present with unusual manifestations, outside of the typical endemic area, without a positive exposure history or positive serologic test, and may be the initial AIDS case-defining opportunistic infection in these patients. Consequently, a disseminated histoplasmosis should be considered in all AIDS patients with perplexing clinical presentations.

# Neurosonology: Its Place in Diagnostic Imaging

---

Michael S. Tenner MD

---

*Dr. Tenner is Professor and Chairman, Department of Radiology, New York Medical College, Valhalla, NY.*

This paper is part of an ongoing series of articles in the *Maryland Medical Journal* honoring the long and illustrious career of John Murray Dennis MD who recently retired as Dean of the School of Medicine at the University of Maryland. Dr. Tenner offers this paper in "gratitude for Dr. Dennis's guidance and teaching in his formative years as a radiology resident under Dr. Dennis's chairmanship."

*A large spectrum of pathology of the brain and spine can be imaged by ultrasound quickly, accurately, and relatively inexpensively without moving an infant from the nursery environment.*

---

At a time when advances in magnetic resonance imaging (MRI) and refinements in computed tomography (CT) have provided imaging of the central nervous system with an exquisite representation of anatomy and pathology processes, it may be asked what role does ultrasound provide? Ultrasound, in fact, fills an invaluable niche in the armamentarium of diagnostic modalities, particularly in imaging the brain and spine in the developing fetus and infant, and is an invaluable aid to operative procedures of the brain and spine. The reasons for this are manifold. It is cost effective, particularly in comparison with the other modalities, in terms of capital acquisition and the costs of providing and preparing space. It provides real-time information that permits evaluation of movement and assessment of blood flow in conjunction with color doppler techniques. Because of the portability of ultrasound equipment, it can be brought to the nursery and a study performed without taking the infant out of its critically controlled environment. Since the ultrasound exam can be done without the need for sedation required for CT (and especially MRI studies), it obviates the attending risk of sedation and the need for an anesthesiologist.

Real-time scanning with a sector or linear array transducer yields good anatomic images with improved resolution as higher frequency transducers are used (3.5 to 7.5 mHz range). This is technically possible because of the lack of bone absorption through the cranial vault's natural windows, the fontanelles, as long as these remain open. A quite extensive evaluation of the brain can now be done through these windows using primarily coronal, sagittal, and parasagittal views. At times, information can be garnered in an axial plane using the poorly mineralized and thin temporal squama of the infant. Differences in echogenicity permit identification of numerous intracranial structures. Vascular structures,

in particular, are well seen because of their high degree of echogenicity. This includes the choroid glomus and its extensions in the lateral ventricles, as well as the surfaces and fissures of the brain where major blood vessels course. This is particularly well-appreciated in real-time studies where pulsations are quite evident. There are differences in echogenicity seen in the interior structures of the brain because of the relative degree of acoustic impedance mismatching that occurs. This not only relates to the cellular differences but the orientation of fiber tracts. This is extremely well-demonstrated in the corpus callosum where the degree of echogenicity clearly varies with the change in direction of insonation. Examples of some of the major structures outlined are seen in Figures 1A and 1B.

Many congenital abnormalities are clearly demonstrated. This is particularly true of those in which there are large fluid-filled components. Arachnoidal cysts, Dandy-Walker malformations, and hydrocephalus are clearly seen. Other congenital malformations have rather typical appearances as well. Agenesis of the corpus callosum, (Figures 2A and 2B) holoprosen-

cephaly, and some disorders of migration of cortical structures are examples.

Congenital brain tumors (Figure 3) are rare. Teratomas and craniopharyngiomas are usually found in the midline. Primitive neuroectodermal tumors and gliomas are usually hemispheric, and choroid plexus papillomas or papillary carcinoma are found in the atrium of the lateral ventricle.

Vascular abnormalities such as arteriovenous malformations (AVMs) are echogenic but produce little mass effect. Vein of Galen aneurysms, whether as a result of AV malformations or AV fistulas, are echo-free and can be mistaken for a quadrigeminal plate arachnoidal cyst.

Inflammatory conditions have a spectrum of changes varying from increased echogenicity at the brain surface secondary to perivascular and pial changes, and parenchymal echogenicity in an area of cerebritis, to echolucency of a mature abscess (Figure 4).

The two most common abnormal conditions, germinal matrix hemorrhage and periventricular leukomalacia, are related to prematurity and hypoxia. Germinal matrix hemorrhages (Figures 5A, B, C and

Figure 1A. Normal coronal sonogram at level of atria of lateral ventricles. Highly echogenic structures are the choroid glomera.

Figure 1B. Normal midline sagittal sonogram. Cavum septum pellucidum and vergae (arrows). Third ventricle (arrowheads). Fourth ventricle (curved arrow). Cerebellar vermis (long arrows).

Figures 2A and 2B. Coronal and sagittal sonograms of agenesis of the corpus callosum. Separation of the bodies of the lateral ventricles (arrows), high-riding third ventricle (curved arrow), and vertical orientation of medial sulci (arrowheads) are characteristic.

D) are classically subependymal in location in the region of the caudate-thalamic juncture and may extend into the brain parenchyma and the adjacent lateral ventricle. The initial hemorrhage is echogenic and then, in time, liquifies peripherally as the central clot

retracts. Continued intraventricular contact of the clot with the cerebrospinal fluid (CSF) may be associated with a persistent communicating hydrocephalus. Prognosis worsens if hydrocephalus persists after the clot resorbs or if parenchymal involvement is present.

**Figure 3.** Congenital glioblastoma multiforme of the thalamus. The tumor is echogenic posteriorly (arrows) and cystic anteriorly (arrowheads).

**Figure 4.** Streptococcal meningoenkephalitis. Echolucent abscess (arrowheads) with surrounding inflammatory changes (increased echogenicity) is present in the right frontal lobe.

**Figure 5A and 5B.** Coronal and sagittal sonograms of acute germinal matrix hemorrhage (arrows).

**Figures 5C and 5D.** Liquification of the hemorrhage six days later.

Periventricular leukomalacia (Figures 6A and 6B) is an ischemic or hemorrhagic infarction of white matter usually in periatlial distribution. It is echogenic equal to or greater than the echogenicity of the choroid plexus in both ischemic or hemorrhagic forms. Although ultrasound is less sensitive in detecting this lesion than MRI, it is more sensitive than CT. The cavitation changes that develop are seen as multiple cystic white matter changes unlike the non-septated, uncomplicated porencephalic cysts seen in the late states of parenchymal germinal matrix hemorrhage. Cerebral hemorrhage secondary to trauma has a similar evolu-

tion as germinal matrix hemorrhages with initial echogenicity, followed by clot retraction and liquification. Subdural hematomas are sometimes difficult to image when they are confined to the high convexity regions. This is especially true in infants with small fontanelles which restrict the amount of angling of the transducer that is possible.

In summary, a large spectrum of pathology of the brain and spine can be imaged by ultrasound quickly, accurately, and relatively inexpensively without moving the infant from the nursery environment. ■

**Figure 6A.** Periventricular leukomalacia, acute. There is increased echogenicity in the periatlial area (arrows).

**Figure 6B.** Periventricular leukomalacia, late. Cystic cavitation has occurred in the previous area of acute infarction.

## No paperwork. No hassle. No kidding.

Electronic claims processing reduces your paperwork, verifies your claims in 24 hours and saves you money every time you file a claim. If you use a computer for billing, LifeCard Provider Network can link your system with most major insurance carriers. If you're not currently using a computer, we'll help you get started.

# When is it Appropriate to Prescribe Hearing Aids for Patients...and When Not?

---

James M. McDonald ScD

---

*Dr. McDonald is Director of Clinical Services, The Hearing Assessment Center, Lutherville, MD.*

---

*There are many factors which enter into the decision about why, where, and when to prescribe hearing aids.*

*The key questions that must be answered to make this determination are outlined here. >*

---

**P**atients with suspected hearing loss should undergo a thorough diagnostic hearing examination by an audiologist to determine the extent and nature of the hearing deficit. The initial question is: Does the patient have active external or middle ear disease?

Diseases requiring medical intervention, such as otitis externa or media, are a clear contraindication for the use of amplification until the disease is resolved or under control.

Once otitis externa and otitis media are treated or ruled out, and there is no evidence of acoustic neuromas, eighth nerve or brainstem lesions, the patient is likely to benefit from hearing aids. This is also true in the case of otosclerosis, when a decision has been made between the patient and physician not to surgically intervene.

The use of hearing aids for patients with otosclerosis is an excellent treatment option. And, it can be combined with other devices, such as loop systems and amplifiers, for additional clarity.

Judgments about hearing loss and appropriate treatments should not be made until the etiology of the loss is determined by a thorough diagnostic examination.

The next question to ask is more lifestyle-oriented than medical: How much does the hearing loss impair the patient? The degree of hearing loss, as well as the degree to which the hearing loss is causing a hearing problem, must be considered when determining candidacy for hearing aids. For example, an attorney who is hearing impaired may have great difficulty in the courtroom -- a problem that is critical to his or her livelihood. On the other hand, a person who is a craftsman with the same degree of impairment may only become frustrated and experience difficulty in group situations where background noise interferes with understanding conversation. This person may not even perceive that he or she has a hearing loss. For this individual, hearing aids may not be necessary. The attorney's situation, however, needs to be addressed; hearing aids may provide the best solution.

Assuming it is appropriate to consider hearing aids, the third question to answer is: Is there hearing loss in one or both ears? The goal is to achieve balanced binaural hearing. If there is loss in

both ears, a prescription for binaural amplification is recommended in order to achieve this goal.

Balance is a vital concern for three reasons:

1. There is strong evidence that a monaural fitting of a patient with a binaural hearing loss results in a deterioration in the hearing of the unaided ear.<sup>1,2</sup>
